This saloon is a long apartment, lighted from the roof, and contains those highly-prized remains of Grecian and Roman sculpture brought to England by the late Earl of Elgin, who had them collected while ambassador from England to the court at Constantinople, about the beginning of the present century, at an expense of nearly L.70,000. They were purchased from the earl by the English government, in 1816, for L.35,000, and are exhibited as the most perfect specimens of art now extant. This valuable collection consists of figures, fragments of columns, and friezes in relief, in white marble. Some of the statues are very much mutilated, others are more entire, but all display the most exquisite design and workmanship, the finely modelled limbs being rounded with the most consummate skill, and in perfect keeping with the natural proportions of the human figure, while the attitudes are singularly easy and graceful.

The labour bestowed on these works is almost incredible; in the frieze, which formed a portion of the ornaments of the Parthenon, and of which one half has been preserved as now shown, amounting to two hundred and fifty feet in length, there are one hundred and ten figures of horses introduced, and of these there are not two in the same attitude, thus showing the fertility of invention which existed amongst ancient artists. The human figures are executed in a similar spirited manner, the utmost diversity prevailing in the costumes and attitudes from first to last.

We next proceeded to the library, or libraries, the most extensive and valuable of all the departments. The first room we entered was of considerable length, surrounded by presses containing books, protected by brass wire-work. About midway a gallery runs round the walls, also with presses reaching nearly to the ceiling. At the opposite extremity to that by which we entered, there was an open window looking into a room beyond, furnished with long tables covered with green cloth; this is called the reading-room. Here there were a number of gentlemen, and, as it happened, one lady, all busily engaged in looking over manuscripts or books, some writing and others reading, the books being supplied by assistant librarians.

The next room we passed through contains the library of the late Sir Joseph Banks, and leading from one side of this apartment is the entrance to the King's Library, a magnificent room arranged for the reception of an immense and valuable collection of books formerly belonging to George III., and presented by him to the museum. To this collection George IV. added, after the death of his father, the extensive library belonging to Buckingham Palace. In this library, the most splendid in the museum, there are many rare and valuable manuscripts; one, the most interesting of all, being a copy of the Hebrew Scriptures, in the form of a web of parchment, on two rollers: it is shown partly unrolled in a glass case. What a difference between this and a modern Bible, executed at a trifle of expense by a printing-press!

Returning again through Sir Joseph Banks' library, we were conducted through another very long and elegant room, supported by lofty pillars, behind which there were deep recesses, and stored, as were the other apartments, with books, to a succeeding room of similar construction and dimensions; and here, by the kindness of my conductor, and an antiquarian friend who had joined us in the Egyptian Saloon, I was shown some things possessing peculiar interest.

The first curiosity to which my attention was directed was a sheet of paper framed and glazed, and suspended against the wall. At a first glance this had very much the appearance of an ordinary bill of *items*. These items, however, were not of ordinary import. The paper was, in short, the rough calculation, or hurried scroll, made by the Duke of Wellington of the amount of his troops on the day of the memorable battle of Waterloo: the regiments successively named, and their respective numbers summed up.

Alongside of this was another frame, enclosing the original seal of Magna Charta, or the great charter granted by King John in the twelfth century—a large impression taken in darkish-red wax.

From the surrounding presses the obliging officials brought forth first a copy of the Evangelists, of the time of Edward the Confessor, transcribed by the hand on vellum, and beautifully illuminated or embellished in the most brilliant colours. This volume has been used at the coronations of the monarchs of England since the time of Edward until lately. The cover is of a darkish-brown skin, being much shrunk by fire, having been rescued from burning while in the possession of a nobleman to whom it formerly belonged.

We can scarcely estimate the labour and time bestowed on the production of a volume such as this; but that transcribing by hand was sometimes as much a matter of pleasure as profit, a copy which I saw of a prayer-book of Queen Elizabeth bears testimony. The queen, it is well known, was mistress of various languages, skilled in Greek, Latin, Italian, and French, and in this volume we have proof of her industry in the mere mechanical accomplishment of penmanship. The prayer-book is in Latin, French, and English, written in a neat and distinct hand, by Elizabeth herself; the cover is also the work of her own hands, being of crimson embroidered in gold, but faded and tarnished by time.

Another book, which excites a still greater degree of interest, now occupied our attention. This was the treasured volume of prayers belonging to the unfortunate Lady Jane Grey, and used by her during her imprisonment and at her execution. It is smaller and less pretending than Elizabeth's. While reverently turning over the leaves, I was taken back in spirit to the dismal scene in the Tower where this volume had been used; and it seemed well that, if there was to be any memorial of Lady Jane preserved, it should be one reminding us of the gentle and devout spirit in which she met her unworthy fate. On the margin of one of the leaves we trace, with feelings which I would vainly endeavour to describe, a few lines addressed to her father, conveying her last wishes, with the most cheerful assurance of the happiness she felt in contemplating her approaching death.

We were next shown a thick manuscript volume of letters of Edward VI., Mary, Elizabeth, Mary Queen of Scots, James I., Charles, Oliver Cromwell, Charles II., &c., and one of Lady Jane Grey beginning thus—"Jane the Queen." This letter was to the mayor of York, and was one of the proofs urged against her at her condemnation.

Amongst other manuscripts shown, there was some portion of the original manuscript of Pope's Iliad, written on scraps of paper, such as backs of letters. This great man was stingy in some matters of expenditure, and drew upon himself the title of "paper-saving Pope." Yet I have always thought that there are worse faults amongst men of genius than scribbling first draughts of verses upon waste paper. In one fragment of a letter, we recognise the name of Addison: another is a note of invitation from a certain duchess, written by one of her officials, or some one connected with her establishment, and beginning in this abrupt way—"The duchess *being drunk*," &c. The invitation was to a fête at the villa of her grace, somewhere on the banks of the Thames. This is a fine burlesque upon the supposed punctiliousness of the great ladies of Pope's day.

Having spent a considerable time in looking over these curious things, we now paid a flying visit to the coin-room, which is never shown but by order. In the present instance, however, this was not required; for, at the appearance of my friend, the doors flew open, and we were received with the utmost courtesy.

This room leads through an outer apartment filled with Egyptian antiquities, such as instruments of various kinds for surgical and other purposes, many of them closely resembling the instruments used in the present day. The coin-room is fitted up with cases and drawers all round; and one of the shallow drawers being taken out, we were shown, reposing on cotton wool, the ancient Jewish shekel, a silver coin thicker than a shilling, and about the same size, I think. It was exceedingly curious to see and handle a coin which represents the circulating medium of the days of the "kings of Israel." I was also gratified by a peep at the coins of Greece and Rome, also the coins of Syracuse, and some of Alexander the Great, all of gold, and displaying perfectly distinct impressions. This class of coins have a rich appearance, in consequence of the impressions being much more raised above the face of the coin than is customary in modern times. It would have been interesting to have traced these ancient coins down to the present time, so as to observe if much progress had been made in the art of striking coins. I suspect that the modern coins would not exhibit any great improvement; the work may be finer and more regular, but I think I should give the preference to the ancient style.

This, my dear Jane, concludes my rambling attempt at a description of one of the most magnificent institutions in the world; and although by any one who knows its extent, I fear I might be charged with presumption in trying to *describe it at all*, yet, in merely relating *what I saw*, as far as my memory serves me, I shall at least be gratified in thinking that I have afforded *you* some degree of entertainment, if not instruction.

DR COMBE ON INSANITY.

Dr Andrew Combe, so favourably known to the public by his useful books on physiology and the preservation of health, has also written a formal work on Insanity, treating it according to the views of Pinel, Esquirol, Gall, &c. We have heard this work spoken of in the highest terms, even by persons who have no faith in the system of mental philosophy advocated by the author. The views of insanity there advanced are sketched by Dr Combe in a letter which he addressed in 1830 to the late Dr Macintosh of Edinburgh, in consequence of a wish expressed by Dr Macintosh that Dr Combe would furnish him with a chapter on the subject for a new edition of his work on the Practice of Physic. We find this letter in the last number of the *Phrenological Journal*, and, with the concurrence of Dr Combe, transfer it to our columns, as a document calculated to give them what we believe to be the only rational doctrines of insanity in a remarkably brief space. It is proper to remark that the letter was not written for publication:—

"I find it more difficult than I expected to comply with your request of either adding my remarks to your article on insanity, or of writing a new one altogether; and, therefore, will rather give you a general notion of the phrenological view of the subject, and leave your own sagacity to make what use of it you can.

First—Insanity is not a specific disease, but a symptom of disordered action in the brain or organ of the mind; and, like every other disorder of function, it may proceed from a variety of different states. The delirium of fever is one form of disordered mind, which is always viewed as a symptom; and so ought all other forms to be. The brain being to the mind what the eye is to vision, it follows that, just as vision is deranged by many pathological states of its organ—such as ophthalmia, iritis, cataract, &c.—so may the mind be deranged by many states of the brain. The sufferers on the Medusa's raft became mad from starvation and exposure, while many become so from excess, particularly in stimulants. The asylum at Milan is filled by lunatics from bad feeding, who almost all recover by nourishing food; while Bayle at Charenton finds many cases arise from chronic meningitis, and Broussais declares that, in the early stages, it is so obviously from inflammatory excitement that it may often be cut short by free leeching, as certainly as pleurisy is by blood-letting. Hence it is not the same disease in all.

Secondly—Insanity, being a symptom of morbid action in the brain, springs naturally from causes affecting its health; and hence a great affinity between the causes of acute cerebral disease and of those more chronic affections on which insanity depends. The *hereditary* tendency depends on a peculiarity of nervous constitution, and is of primary importance. *Excess* of some mental qualities, leading to eccentricity, predisposes in irritable constitutions, from the high action into which the corresponding predominant organs are thrown; and hence the latter are generally those whose manifestations are deranged, as proved in Dublin by my brother having, in so many instances, pointed out correctly, *from development*, the probable form of the mental affection. Other predisposing causes, such as age, sex, profession, &c., are referable to the same principle.

Thirdly—The *exciting* causes are *whatever disorders the action of the brain*. That organ requires regular exercise for its health and preservation, and for the improvement of its functions, just as other parts do—as the muscles in fencing or dancing. Practice in the latter instances increases nutrition, and consequently power; and it gives a facility of combination to produce a given end. The same organic laws preside over the brain; consequently, *excess* of exercise, as in intemperate study, excitement of passion, anxiety, and strong mental exertion long sustained, leads to morbid cerebral action, with derangement of function in irritable subjects. *Deficiency* of exercise, or idleness, leads equally to diseased action and manifestation, as exemplified in the melancholy and ennui of the retired merchant or soldier, and in the numerous victims in the unoccupied classes of society. Local causes act by disordering the brain. Blows on the head, *coups du soleil*, intense cold, drunkenness, meningitis, &c., show this.

Fourthly—Dyspepsia, and other disorders of the abdominal viscera, excite it secondarily in some instances in *predisposed* subjects; but, in general, mental causes have preceded. The same remark applies in

certain maniacal diseases in which the affection of particular external organs is generally the effect, and not the cause, of the cerebral disturbance. The brain, in short, is more frequently disordered by direct than by indirect causes; and, in this respect, the analogy between it and other organised parts is preserved.

Fifthly—The *symptoms* indicative of insanity consist of deranged cerebral functions and local phenomena. Every sense, every nervous function, and every faculty of the mind, may be involved in the disease or not; and hence indescribable variety. The *true standard is the patient's own natural character*, and not that of the physician or of philosophy. A person from excess of development in one part of the brain may be eccentric and singular in his mental manifestations, and yet his mental health be entire. Before we can say that he is mad, we must be able to show a departure from his *habitual* state which he is incapable of controlling. An irascible man may be very boisterous without being mad; but if a mild and timid creature become equally boisterous and irascible, we may apprehend disease. One may be *naturally* suspicious, jealous, and cunning, without being insane; but if a man of an open, generous, and unsuspecting nature become so, danger to his cerebral health is at hand. The derangement may be either an excitement of the patient's predominant qualities, or a diminished action, or a perversion or vitiation of function. A proud man may, for instance, become a king during disease, from *excitement* of function; he may humble himself in the dust as unworthy to walk upright, from its *diminution;* or he may fancy himself something out of the ordinary course of nature, from its *vitiation*. Or one who is attached to friends when in health, may either have inordinate love for them when insane, or be indifferent, or have a hatred and aversion to them; and so on with every feeling and faculty of the mind.

The co-existence of digestive derangement modifies the mental state, and gives greater anxiety and irritability than where the stomach, liver, and bowels act well. Other complications modify in other ways.

Monomania, religious, erotic, and other manias, are not different diseases. One organ and faculty being chiefly affected, and the rest entire, gives rise to monomonia; but the proximate cause may be, and often is, the same as where all the organs and faculties are affected. Religious despondency is the mere symptom also, and appears because the function of some cerebral parts is to manifest religious feelings; and those being diseased, the function necessarily suffers, and the feeling is altered. But the *same* pathological state affecting Combativeness and Destructiveness, would produce furious mania.

Monomania and melancholy are less easily curable, not from the proximate cause being more serious, but partly from the other faculties succeeding in longer concealing the existence of abberration; whereas in mania it betrays itself early in spite of the patient.

Insanity is not a state separated by a broad line from sound mind. Every gradation is observable, and we perceive morbid action before we can venture to say that the patient is insane. Some are cured at home of mental affections in a few weeks, who, if sent to an asylum, would become mad, and remain so for months or years.

Besides what you notice in regard to treatment, every thing demonstrates that *employment* to the patients is not sufficiently studied. The brain loses its health from vacuity of mind, and yet we shut up in scores, in perfect idleness, men who, when well, were accustomed to an active and bustling life, and whom, at any time of their lives, idleness would have driven mad. Manual labour and occupation are of immense consequence, and the moral influence of keepers and superintendants acquainted with human nature, and interested in their vocation, is prodigious in producing quietude, and accelerating recovery, just from giving to the brain that healthy exercise which it requires. Lunatics retain a good deal of reason even in their worst condition, and hence are more accessible to the influence of reason and example than might be supposed. In every point of view it is best to act towards them with the same consistency, honesty, and good feeling, as if they were quite in possession of themselves. They are quick in detecting deceit; and when once deceived, never give confidence again. I mention this because I differ from what —— once said to you on this subject, in having flattered and led D—— by his predominating self-esteem, and from what you said in accordance with it. My experience says, Never advance a word which you cannot conscientiously stick by when the patient recovers, and you will retain your ascendancy. Do not thwart his delusion, but neither give it any countenance. —— is now satisfied I am right in this. Remove all provocatives and allusions to the morbid feeling or idea, and exercise the faculties which remain sound.

In subjects not delicate, and not beyond middle life, I find many who are greatly benefited by occasional leeching, followed by tepid bathing, and cold to the head while in the bath. Many, of course, do not require depletion; but it may be advantageously employed when the usual indications exist. General bleeding I know little of, and do not like. After the irritability and excitement of the immediate explosion are over, a *great deal* of exercise in the open air seems most useful in diminishing irritability, relieving the head, and procuring *sound* sleep; but if used too soon, it injures. The ordinary principles of pathology ought, in short, to regulate medical treatment, and adapt it to the state of the *individual* patient, for the latter is the only safe and successful plan. I remain," &c.

MR REDDING'S "CORNWALL."

Of "England in the Nineteenth Century," which we lately noticed as a beautiful popular topographical work newly commenced, four numbers of each "division" have now been published, and the promise held out in the first parts is amply fulfilled. The typography, embellishments, and literature of the work, are all of the most satisfactory kind. Every man seems to do his duty, whether "England" expected it or not. We are somehow most pleased with Cornwall, probably because it is more a region of tale and tradition than steam-ridden Lancashire. Mr Redding appears to be admirably adapted for the task which he has undertaken: he never dwells too long on the commonplace, and he lays hold of and draws in every thing that is interesting. We see the poet in such touches as the following respecting the Lizard point—"the last land of their native isle that was visible to many who were never to revisit its shores, and the first seen by joyous spirits whom years and climes had long separated. From hence vessels outward bound on voyages that have become matter of history, took the observation by which they were to career over the bounding deep to unvisited shores, and proud war-ships dated their departure to scenes of disaster or conquest."

Twelve miles from Falmouth is Helston, a small borough, where the ceremonies which we lately described in an article on May-day were, till a recent period, celebrated with unusual vivacity, but on the 8th of the month, which is there called *Furry Day*, probably from old Cornish *feur*, a holiday. The whole population of the town was involved in the dancing and festivity of this occasion, without the least harm to any one. Mr Redding justly remarks—"Nor was such a time without its social use in bringing the poorer class in contact with the wealthier, and keeping up a kindly feeling, which once in a year could hardly be productive of great self-sacrifice to those who carried their chins the most loftily. Mr Gilbert complained that the practice was diminishing every year, plainly showing from what cause, by stating that all was fast tending towards 'the single entertainment of a ball.' It appears that if the ladies had heretofore succeeded in their will, the very memory of the festival would have been lost. It is thus that, before the mixture of vulgar pride and ignorant exclusiveness so prevalent in these times in the middle ranks of society, the separation of the different classes is with much impolicy rendered wider. The classes never momentarily linked, and kindliness changing to indifference, dislike and antipathy towards each other are shown upon the most trivial occasions; thus old things that are harmless, and even beneficial, in their existence, are disappearing with what of old things may be very wisely resigned."

In Pengerswick Tower, near Sidney Cove, now in ruins, there is still a wainscoted room, displaying painted devices on the panels, with quaint inscriptions in verse. Two of the latter, respectively illustrative of perseverance and niggardliness, are worth quoting:—

"What thing is harder than the rock?
What softer is than water cleere?
Yet wyll the same, with often droppe,
The harde rock perce, as doth a spere.
Even so, nothing so hard to attayne,
But may be hadd with labour and paine.

Beholde this asse, wiche laden ys
With riches, plentye, and with meat,
And yet thereof no pleasure hathe,
But thystells, hard and rough, doth eat.
In like case ys the rich niggarde,
Wich hath inoughe, and lyveth full hard."

We are happy to find the habits of the Cornwallians with regard to wrecks placed in a more favourable light than heretofore by Mr Redding. "Before the care of coasting-vessels was confided to a race of men of the existing experience and talent, the wrecks along this part of the coast used to be frequent; and they were the more frightful, because it was rarely the case that a solitary individual survived to relate from what port the vessel came, and whither it was bound. Within the last thirty years, these disasters have been fewer, and occurred only when storms of great violence came on suddenly, or through the mistake of one headland for another in misty weather. But though coasting-vessels were those which were once most frequently lost upon this iron shore, the long continuance of westerly winds, and errors in reckoning, caused many a disaster to foreign ships of burden, as well as to those of our own country; and in general no more was known of any ship cast away here, or of her crew, than the cargo and fragments, strewed over miles of the shore at low water, might indicate. No ship could hold together an hour in a gale on this fearful coast, unless flung upon some very favourable spot at high tide. Such spots are few; the sea breaks, for the most part, against precipices of great height. One vessel, of which we saw some relics, was never seen entire: neither her name, nation, nor the fate of her crew was ascertained. She had been lost, it was supposed, late in the night, for on the preceding evening at sunset, no sail was seen in the horizon with a telescope. It was blowing fresh, and in the morning some planks were found and foreign kegs of butter, which, with other circumstances, led the people to believe that the property must have been Dutch; no bodies, no clothes, no portions of the masts or rigging were stranded; the spot where the shipwreck occurred was only guessed at by a few fragments of the rib timbers being discovered jammed among the rocks—all besides had been taken into the fathomless deep. In one case, a Newfoundland dog was the sole survivor of a ship's living cargo; in another, a black man reached the shore through the surf, but died before he could tell the name of the vessel to which he belonged.

Nothing can be more untrue than the charge of Cornish barbarity, since in no part of England shipwrecked persons meet with greater kindness; though it is but seldom that this kindness can be put to the test by the escape of any animated being to experience it. On the wreck of the *Anson* frigate, thirty years ago, not only were the survivors most kindly treated, but the efforts made to assist in the escape of the crew were all which were possible in such a dreadful scene. One individual, whose name is to us unknown, or we would print it—one whose name deserves to be remembered far before the destroyers of their species, of whom national immorality makes its molten gods—came down to the spot. The frigate lay with her bottom seawards, and the waves rolled over her, and fell in 'horrible cascade' on the shore side and up the sandy beach, carrying the living and the dead with them, and upon the recoil bearing them back into the ocean depths. The only assistance that could be given was by venturing as far as possible into the surf, and snatching the half-drowned that could be reached out of it—an effort not to be made at such times without much hazard. The individual to whom we allude was a methodist teacher, a humble man, who had come down on horseback to the spot. He rode intrepidly into the foam, and succeeded in getting hold of two of the crew, one after the other, whom he saved; but on venturing the third time into the raging surf, as he was grasping at another, a wave swept both horse and rider away, in the presence of hundreds of persons who could render no assistance; and this man, to us nameless, found in this way the proudest death and interment that is destined for humanity—losing his life in the act of trying to save a fellow-creature from destruction, and having the bosom of the ocean for his sepulchre.

The charge of want of hospitality or kindness in the Cornish to shipwrecked persons, then, is not true. We have said that vessels break up almost as soon as they touch the shore, which for miles is strewed with portions of the cargo and timbers. These the country people pick up, and the finder too often appropriates. It is from this circumstance that the Cornish have been accused of barbarity and wreck-plundering; the vulgar had a notion formerly that the property saved from shipwreck belonged to any one who was on board that survived, and if no one survived, to any body who might pick it up from the beach.

In those days, wreck picked up from the sea-shore was styled 'a godsend.' The well-known story of 'A wreck! a wreck!' being cried at the church-door, and the parson with difficulty restraining the people a moment, on some excuse, until he got down from the pulpit himself into the aisle, and then said, 'My good friends, let us all start fair,' might be true enough, if we believed that an educated man even in the 'good old times' could be guilty of such an indecency. It is true, we were told, and have no reason to doubt the correctness of our information, that in those days an individual who had been well educated, and did not want the good things of this life, but who was a drunkard, and in every respect a highly immoral man, once tied up the leg of an ass at night, and hanging a lantern from its neck, drove it himself along the summit of the high cliffs on that part of the northern coast where he lived, in order that the halting motion of the animal might imitate the plunging of a vessel under sail, and thus tempt ships to run in, from imagining there was sea-room, where destruction was inevitable. The same individual was accused of having cut the fingers off the dead body of a lady which was washed on shore from a wreck, to secure the rings which decorated them. The very rumour now that any man had been guilty of such an atrocity, would expel him from society in Cornwall, and from the county itself; but for such instances of inhumanity on the part of any class, whatever might have happened a century or two ago, there is not the remotest foundation in modern times.

We cannot avoid mentioning here, as being in some degree connected with the appearance of what people call a death-ship, on one part of this coast, the result of an inquiry we made upon the subject. Our informant had lived there all his days, and told us that in his father's boyhood there was a person resided in the village of T—— who was distinguished for his oppressive conduct, his private vices, and the possession of property which was acquired by sinister means. In our informant's words—

'He was a man well off in the parish, but that was nothing to him.'

'Did you know him?'

'No; it was in my father's youth; but he declared it was true, and he was not given to falsehood; it is fourscore years ago; his name was' ——

We shall not mention the name, as some of his descendants may be alive—if he had descendants—and proceed to what our informant said farther.

'What did the people think of him?'

'I can't say, because it was before I was born; but the death-ship story pretty well explains that, I should think.'

'The death-ship—what was that?'

'Why, Mr ——, drunk one half his time, and given to all kinds of bad conduct when he was sober, was taken very ill at last, yet seemed to have no care about his condition, and, when he could use his tongue, swore and blasphemed as hard as ever. Just before he died, a frightful thing occurred, which leads me to the purport of your question about the death-ship.'

'Well, what was that?—he plundered one wreck too many, I suppose?'

'No; a day or two before he breathed his last, a party of men were working near the top of the cliffs, where they were several hundred feet in elevation; the weather was hazy over the sea, when on a sudden one of them exclaimed, 'Do you see that? there is a ship close in with the shore.' All the party saw the vessel looming through the haze, tall, dark, and square-rigged, but they could observe nothing further, as it disappeared seawards in the mist, and quickly vanished from their sight. There was no wind, and the impossibility of navigating without it struck these men, so that it became a subject of conversation in the church-town.

In a hollow, at the foot of the cliffs before mentioned, there was a considerable space of sand, dry at low water, and some persons had gone thither to collect shell-fish a day or two after the preceding occurrence, when they saw a tall dark vessel run in almost close without a breath of wind, her sails appearing full, and of a deep black colour. The coast abounded in sunken rocks, among which she seemed to thread a tortuous course without touching one. No living thing was upon the deck which they could discern from stem to stern; the wheel had no helmsman; no seaman was on the look-out, and none hove the lead: at which sight the observers felt a thrill, as if it was something, they knew not what, out of the ordinary course of things, particularly as, at the same moment, it lay-to, and the sails began to shiver. Thus riveted to the spot by a sensation which they found it impossible to describe, the sails again filled, and the ship appeared to glide away until it was reduced to a mere speck, and disappeared in an instant, apparently at the distance of leagues, much as the figures of a magic lantern glide along a whitened wall. Some thought, for the moment, it was a deception of their sight, and rubbed their eyes—for the whole appearance did not occupy any perceptible duration of time, and yet there was time enough for the strange object to fix their attention, and allow them the most perfect examination of her form and tenantless deck. After looking for some minutes at the broad expanse of sea before them, upon which, to the remotest point of the horizon, not one solitary sail appeared, they hastened to the church-town, eager to communicate what they had just seen, when the first news they heard was, that the well-known and notorious Mr —— had just expired.'"

MISTAKEN GENEROSITY.

There are strange contradictions in some of the popular modes of judging of human character—contradictions which, if they were to exist in religious society, would be laid hold of by the world, and exhibited to view, as proofs of the unsubstantial nature of all such profession. Amongst these, there is none more striking, and certainly none more injurious to the well-being of society, than the habit of attributing to young men of gay and dissipated habits an excess of generosity, and an absence of selfishness, which are considered as outweighing all their moral delinquencies. Whether this false estimate of character is derived from the glowing and attractive descriptions of some of the popular heroes of ancient as well as modern romance; or whether it is merely that mankind can accommodate their judgment to circumstances, so as to admire what it suits their inclination to imitate—it is not our business now to inquire. But it may not be foreign to the subject in hand, to tax the patience of the reader for a few moments, so far as to ask, in what does the generosity and the disinterestedness of the characters alluded to consist? Is it in their kind and consistent regard to the feelings of those by whom they are most beloved, and whom they profess to love in return? Is it in their self-denial—in the privations they undergo for the sake of promoting the happiness of others? Is it in the full and efficient returns they render for all the care and anxiety of which they are the cause? Is it in the abundant bestowment of their pecuniary means, to support the destitute and to solace the afflicted? Is it in the faithfulness and punctuality with which they hold themselves ready at the call of duty to answer the demands of friendship and affection? Is it in the sacredness with which they fulfil every trust committed to their charge? Is it, in short, in their absence of self-love, and their disregard of self-gratification in comparison with the gratification of their friends? If there be any meaning in the words generosity and good-heartedness, they would surely comprehend some of these points; and yet in all these are the characters of the gay and the dissipated peculiarly deficient. If we could, by any means of calculation, add together all the tears which such characters habitually and recklessly cause—all the hours of anxiety they inflict upon their near connexions—all the bickerings and disputes occasioned by their conduct between those who censure and those who defend them—all the wretched feeling they leave behind them whenever they go out—all the anguish which awaits their return—all the disappointment of those who trust them—and, finally, all the wretchedness attendant upon the full development of those vices of which what the world calls gaiety is the natural and certain germ; if we could add all these together, we should behold a sum of human misery greater than ever was produced by absolute crime—by murder, theft, or any of those gross and desperate acts, against which public indignation is so justly and unanimously raised. If we could add all these together, we should see, operating through different channels, a mass of selfishness with which that of the solitary miser bears no comparison. The life of the gay man is, in fact, a system of self-indulgence, of self-gratification, of self-worship. The miser, in his despised and isolated sphere, has no power to prey upon the happiness of society. The privations he imposes extend no farther than himself; and, if no other individual shares in what he gains, he is alone in the punishment he inflicts. But the dissipated man has a wider influence, because he is the hero of society in its worst state. He has therefore the power to disseminate the seeds of evil in a degree proportioned to his popularity; and in the same measure as he is beloved, he is capable of inflicting misery. He knows that he can do this, and he does it still. He knows that he is the cause of floods of burning tears, and while he weighs them against one intoxicating draught, it is self-love that prompts him again to hold the sparkling poison to his lips, and to let the tears flow on.—*Family Secrets.*

THANATOPSIS.

[The following lines by BRYANT, an American poet, have been much admired. The name Thanatopsis, which he has given to them, signifies "A Discourse on Death."]

To him who, in the love of Nature, holds
Communion with her visible forms, she speaks
A various language. For his gayer hours
She has a voice of gladness, and a smile
And eloquence of beauty; and she glides
Into his darker musings with a mild
And gentle sympathy, that steals away
Their sharpness, ere he is aware. When thoughts
Of the last bitter hour come like a blight
Over thy spirit, and sad images
Of the stern agony, and shroud, and pall,
And breathless darkness, and the narrow house,
Make thee to shudder, and grow sick at heart—
Go forth unto the open sky, and list
To nature's teachings, while from all around—
Earth and her waters, and the depths of air—
Comes a still voice—Yet a few days, and thee
The all-beholding sun shall see no more
In all his course. Nor yet in the cold ground,
Where thy pale form was laid, with many tears,
Nor in the embrace of ocean, shall exist
Thy image. Earth, that nourished thee, shall claim
Thy growth, to be resolved to earth again;
And, lost each human trace, surrendering up
Thine individual being, shalt thou go
To mix for ever with the elements,
To be a brother to the insensible rock
And to the sluggish clod, which the rude swain
Turns with his share, and treads upon. The oak
Shall send his roots abroad, and pierce thy mould
Yet not to thy eternal resting-place
Shalt thou retire alone; nor couldst thou wish
Couch more magnificent. Thou shalt lie down
With patriarchs of the infant world—with kings,
The powerful of the earth—the wise, the good,
Fair forms, and hoary seers of ages past,
All in one mighty sepulchre. The hills,
Rock-ribbed and ancient as the sun; the vales,
Stretching in pensive quietness between;
The venerable woods; rivers that move
In majesty; and the complaining brooks,
That make the meadow green; and, poured round all,
Old ocean's grey and melancholy waste—
Are but the solemn decorations all
Of the great tomb of man. The golden sun,
The planets, all the infinite host of heaven,
Are shining on the sad abodes of death,
Through the still lapse of ages. All that tread
The globe, are but a handful to the tribes
That slumber in its bosom. Take the wings
Of morning, and the Barcan desert pierce;
Or lose thyself in the continuous woods
Where rolls the Oregon, and hears no sound,
Save his own dashings; yet the dead are there;
And millions in those solitudes, since first
The flight of years began, have laid them down
In their last sleep—the dead reign there alone.
So shalt thou rest; and what if thou shalt fall
Unnoticed by the living, and no friend
Take note of thy departure? All that breathe
Will share thy destiny. The gay will laugh
When thou art gone, the solemn brood of care
Plod on, and each one, as before, will chase
His favourite phantom; yet all these shall leave
Their mirth and their employments, and shall come,
And make their bed with thee. As the long train
Of ages glide away, the sons of men,
The youth in life's green spring, and he who goes
In the full strength of years—matron and maid,
The bowed with age, the infant, in the smiles
And beauty of its innocent age cut off—
Shall, one by one, be gathered to thy side,
By those, who, in their turn, shall follow them.
So live, that, when thy summons comes to join
The innumerable caravan, that moves
To the pale realms of shade, where each shall take
His chamber in the silent halls of death,
Thou go not, like the quarry-slave at night,
Scourged to his dungeon; but, sustained and soothed
By an unfaltering trust, approach thy grave,
Like one who wraps the drapery of his couch
About him, and lies down to pleasant dreams.

INTEMPERANCE IN STEAMERS.

We have sometimes heard of the extraordinary quantities of liquor consumed in the steamers which cross the Atlantic: a person who had come to England in one of them, mentioned to us, that as much as eighty dozens of champagne had been consumed on board during his passage—that, in fact, that liquor was taken by many at breakfast instead of tea or coffee. This may perhaps have been an exaggeration; but it is evident that the power of laying in a store of untaxed liquors in America, and the practice of giving them to passengers without additional charge, would have any thing but a beneficial effect. We are glad to observe, from the work of Mr Sturge, that on board the *British Queen*, in which he sailed to New York, this improper practice does not now exist. "The very objectionable custom (he says) of supplying the passengers with intoxicating liquors without limit and without any additional charge, thus compelling the temperate or abstinent passenger to contribute to the expenses of the intemperate, was done away. Each individual paid for the wine and spirits he called for—a circumstance which greatly promoted sobriety in the ship; but I am sorry to say three or four, and these my own countrymen, were not unfrequently in a state of intoxication. On one occasion after dinner, one of these addressed an intelligent black steward, who was waiting, by the contemptuous designation of 'Blackey.' The man replied to him in this manner—'My name is Robert; when you want any thing from me, please to address me by my name; there is no gentleman on board who would have addressed me as you have done. We are all the same flesh and blood; I did not make myself—God made me.' This severe and public rebuke commended itself to every man's conscience, and my countryman obtained no sympathy even from the most prejudiced slaveholder on board."

HINTS FOR STUDENTS.

We extract the following from a work now somewhat rare—*Buck's Anecdotes*:—"He who would wish to make proficiency in any science, must give himself to study. Knowledge is not to be gained by wishing, nor acquired by dignity and wealth. Application is necessary both for prince and peasant. Many in elevated situations are very desirous of the honour, but averse to the labour, of intellectual attainments.

Euclid was asked one day by King Ptolemæus Lagus, 'Whether there was not a shorter and easier way to the knowledge of geometry than that which he had laid down in his Elements?' He answered, that 'there was indeed no royal road to geometry.' In the same manner, when Alexander wanted to learn geometry by some easier and shorter method, he was told by his preceptor that 'he must here be content to travel the same road with others, for that all things of this nature were equally difficult to prince and people.' We may apply this observation to learning in general. If we wish to enjoy the sweets, we must encounter the difficulties, of acquisition. The student must not be always in the world, or living at his ease, if he wish to enlarge his mind, inform his judgment, or improve his powers. He must read, think, remember, compare, consult, and digest, in order to be wise and useful.

In respect to study, there are some necessary precautions to be attended to, both as to the body and the mind. Hence a minister of the gospel used to give this advice to young students:—1. That they should not buy too many books, as that would hurt their pockets; 2. That they should not engage in any sensual pursuits, as that would hurt the mind; and, 3. That they should not sit up late at night, as that would injure their health.

Dr Whitaker gave the following three rules to Mr Boyce, when a student:—1. To study always standing; 2. Never to study in a window; 3. Never to go to bed with his feet cold.

Night studies are very prejudicial to the constitution, and ought to be avoided by all who wish to prolong their lives, and to be useful in their day and generation. However fond of study, therefore, let the student pay some attention to health. It is said of Euripides, the tragedian, that he used to retire to a dark cavern to compose his tragedies; and of Demosthenes, the Grecian orator, that he chose a place for study where nothing could be heard or seen; but, with all deference to such venerable names, we cannot help condemning their taste. A man may surely think to as good purpose in an elegant apartment as in a cave, and may have as happy conceptions where the all-cheering rays of the sun render the air wholesome, as in places where they never enter.

Charles V., during his celebrated solitude, sometimes cultivated the plants in his garden with his own hands, and sometimes rode out in the neighbourhood, and often relieved his mind in forming curious works of mechanism. Descartes spent the afternoon in the conversation of his friends, and in the cultivation of a small garden. After having in the morning settled the place of a planet, in the evening he would amuse himself with watering a flower. Barclay, in his leisure hours, was a florist. Balzac amused himself with making pastils. Pecresc found his amusement amongst his medals and antiquarian curiosities. Rohault wandered from shop to shop to observe the mechanics labour. Cardinal de Richelieu, amongst all his great occupations, found a recreation in violent exercise, such as jumping, &c. It is said of the very laborious Mr Poole, that his common rule was, while he was engaged in writing his famous Synopsis, to rise about three or four o'clock in the morning, and continue his studies till the afternoon was pretty far advanced, when he went abroad, and spent the evening at some friend's house in cheerful conversation."

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row.

Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

CHAMBERS'
EDINBURGH JOURNAL

NUMBER 537. SATURDAY, MAY 14, 1842. PRICE 1½d.

THE GOVERNESS.

BY MRS S. C. HALL.

PART FIRST.

"Of course I head my advertisement thus:—'Wanted —a governess,'" commenced Mrs Gresham; but before I permit her to read it, I ought to state that she had called upon her sister, Mrs Hylier, to consult concerning this important composition, to be sent that day to the *Morning Post*—Mrs Gresham and Mrs Hylier being both in want of resident governesses to educate their children. A visiter was also there, a Mrs Ryal, confessedly the "most clever woman" of the neighbourhood—an astonishing manager!—but although the ladies desired her advice, they were somewhat in dread of her sarcasm.

Mrs Gresham had again repeated "'Wanted—a governess,'" when an old gentleman, a Mr Byfield, was announced. The trio of wives and mothers looked at each other, as well as to say, "What a bore!"—and then Mrs Hylier rose gracefully from her *chaise longue*, and, smiling sweetly, extended her hand, and welcomed Mr Byfield with exceeding warmth of manner; while Mrs Gresham and Mrs Ryal declared aloud their delight at being so fortunate as to meet a neighbour they had so seldom the pleasure to see.

The party thus assembled were all inhabitants of the bustling yet courtly suburb of Kensington; and Mr Byfield being a rich and influential, though a very eccentric man, was sure of being treated with the distinction which people of small means are too prone to bestow upon those whose means are more extensive.

"Do not let me interrupt you in the least, ladies," said the old man, quietly taking his seat near the window. "Mr Hylier promised I should look over these gems by daylight; and when you have talked your own talk, there will be time enough to talk mine." The ladies, one and all, declared their conviction that his "talk" must be more pleasant and instructive than theirs. He did not deny this, but smiled—shook his head—touched his hat (which he had laid down at his feet), as if to say he would either go or have his own way. And so Mrs Gresham recommenced reading her advertisement—"'Wanted—a governess. Any lady possessing a sound English education, a thorough knowledge of the theory and practice of instrumental and vocal music, and a perfect acquaintance with the French, Italian, and German languages; also with the rudiments of Latin.'"

"Latin!" interrupted Mrs Ryal. "Latin! why, what *do* you want with Latin for a pack of girls?"

"I thought," answered Mrs Gresham meekly, "that as there are but three girls, Teddy might do his lessons with them for a little while, and that would save the expense of a tutor."

"Oh, very good—very good," replied Mrs Ryal; "then add also, Greek; if the governess is any thing of a classic, you'll get both for the same money."

"Thank you, dear Mrs Ryal; how clever you are! G-r-, there are two 'ees' in Greek?—'also the rudiments of Latin and Greek.'"

"I beg your pardon once more," said the provokingly "clever lady;" "but put Greek and Latin, that is the correct way."

"'Greek and Latin, and the principles of drawing—if her character will bear the strictest investigation, may hear of a highly respectable situation by applying to Z. P.'"

"Post paid," again suggested Mrs Ryal.

"Of course," continued Mrs Gresham; "'and as the lady will be treated as one of the family, a high salary will not be given.'"

"Well," said Mrs Ryal, "I think that will do. You have not specified writing and arithmetic."

"English education includes that, does it not?"

"Why, yes; but you have said nothing about the sciences."

"The children are so young."

"But they grow older every day."

"Indeed that is true," observed pretty Mrs Hylier with a sigh, and a glance at the pier-glass. "My Ellen, though only ten, looks thirteen. I wish her papa would let her go to school; but one of his sisters imbibed some odd philosophic notions at school, so that he wont hear of it, but talks about the necessity of putting female seminaries under the superintendence of government, and I really know not what."

"I certainly," observed Mrs Ryal, "will not take a governess into my house again to reside—they are all *exigeant*. One was imprudent enough to wish to get married, and expected to come into the drawing-room when there was company of an evening. Another would have a bedroom to herself, though, I am sure, no one could object to sleep in the same room with my own maid. Another—really the world is very depraved—occasioned a painful difference between Mr Ryal and myself; and let *that* be a warning to you, my dear friends, not to admit any pretty, quiet, sentimental young ladies into your domestic circles. Mr Ryal is a very charming man, and a good man; but men are but men after all, and can be managed by any one who will flatter them a little. Of course, he is a man of the highest honour; but there is no necessity for having a person in the house who plays or sings better than ones-self."

"Oh, my dear Mrs Ryal!" exclaimed both voices, "you need never fear comparison with any one." The jealous lady look pleased, but shook her head. "Well, at last I resolved to be my own governess—with the assistance of a *young person*, who comes daily for *three*, and sometimes I get *four*, hours out of her; and she is very reasonable—two guineas a-month, and dines with the children. She is not *all* I could wish; her manners are a little defective, for she is not exactly a lady; her father is a very respectable man, keeps that large butter shop at the corner—I forget—somewhere off Piccadilly—but I prefer it, my dear ladies, I prefer it—*she does all the drudgery without grumbling*. Your officers' and clergymen's daughters, and decayed gentlewomen, why, their high-toned manners—if they never speak a word—prevent one's being quite at ease *with* them, though they are, after all, only governesses."

"But," suggested Mrs Gresham mildly, "lady-like manners are so very necessary."

"Yes," answered Mrs Ryal, "so they are; for you and I"——

"And children so easily imbibe vulgar habits, that it is really *necessary* to have a lady with them."

"Well," said Mrs Ryal, with a sneer, "ladies are plenty enough. I daresay you will have fifty answers. What salary do you mean to give?"

Mrs Gresham was a timid but kind-hearted woman, one who desired to do right, but had hardly courage to combat wrong. She was incapable of treating any thing unkindly, but she would be guilty of injustice if justice gave her much trouble; she hesitated, because she required a great deal, and intended to give very little.

"*I* cannot give more than five-and-twenty pounds a-year to any one," said Mrs Hylier in a decided tone. "My husband says we cannot afford to keep two men-servants and a governess; he wanted me to give the governess seventy, and discharge Thomas; but that was quite impossible; so I have made up my mind: there are only two girls. No after claps, like my sister Gresham's little 'Teddy;' she can spend every evening in the drawing-room when we are by ourselves—have the keys of the piano and library—amuse herself with my embroidery—go to church in the carriage on Sunday—and drive at least once a-week with the children in the Park. There!" added Mrs Hylier; "I am sure there are hundreds of accomplished women who would jump at such a situation if they knew of it."

"Washing included?" inquired Mrs Ryal.

"No. I think she must pay her own washing, unless there was some great inducement."

"You allow no followers?"

"Oh, certainly not. What can a governess want of friends? Her pupils ought to have all her time."

"God help her!" murmured the old gentleman. The murmur was so indistinct that the ladies only looked at each other, and then Mrs Hylier said, "Did you speak, sir?" There was no answer; the conversation was resumed with a half whisper from one lady to another, that perhaps Mr Byfield was not deaf at all times.

"And what do *you* intend giving, Mrs Gresham?" questioned Mrs Ryal.

"I have three girls and a boy," she replied; "and I thought of forty."

"It will be impossible to prevent your governess from talking to mine, and then mine will get discontented; that is not fair, Fanny," observed her sister; "say five-and-thirty, allowing for the difference of number."

"And plenty, I call it," said Mrs Ryal. "What do they want but clothes? They never lay by for a rainy day. There are hundreds—yes, of well-born and well-bred ladies—who would be glad of such situations."

"I am sorry for it," said the old gentleman, rising and advancing to where the three Kensington wives were seated; "I am very sorry for it."

"Indeed, Mr Byfield! why, we shall have the better choice."

"Forgive me, ladies, for saying so—but still more am I grieved at that. Permit me to read your advertisement."

Mrs Gresham coloured; Mrs Hylier had sufficient command over herself not to appear annoyed; but Mrs Ryal, the oracle of a *clique*, the "clever woman," who had, by the dint of self-esteem and effrontery, established a reputation of intellectual superiority over those who were either too indolent or too ignorant to question her authority, evinced her displeasure by throwing herself back in her chair, loosening the tie of her bonnet, and dressing her lips in one of those supercilious smiles that would mar the beauty of an angel.

"'Wanted, a governess,'" read the old gentleman, who frequently interrupted himself to make the following observations:—"'Any lady possessing a sound English education'—that in itself is no easy thing to attain—'a thorough knowledge of the theory and practice of vocal and instrumental music'—a thorough knowledge of the theory and practice of either the one or the other requires the labour of a *man's* life, my good ladies—'and a perfect acquaintance with the French, Italian, and German languages'—how very useless and absurd to found professorships of modern languages in our new colleges, when, in addition to the musical knowledge that would create a composer, a single person, a young female, can be found possessed of a '*perfect* acquaintance' with French, Italian, and German! Oh, wonderful age!—'also, the rudiments of Greek and Latin—may hear of a highly respectable situation by applying to Z. P., post paid, Post-Office, Kensington.' Much as you

expect in the way of acquirements and accomplishments, ladies," continued the critic, still retaining fast hold of poor Mrs Gresham's composition, "you have not demanded a great deal on the score of religion or morality—neither are mentioned in your list of requisites."

"Oh!" exclaimed Mrs Hylier, "they are taken for granted. No one would think of engaging a governess that was not moral and all that sort of thing, which are always matters of course."

"To be sure they are," added Mrs Ryal, in that peremptory tone which seemed to say, Do you dare to question my opinion? "To be sure they are; every one knows that nothing can be more determined with respect to religion and morality than my practice with my children. Rain, hail, or sunshine, well or ill, the governess must be in the house before the clock strikes nine. Psalms read the first thing; and if they have not got well through the French verbs, a chapter besides *for punishment;* catechism, Wednesdays and Fridays; and the collect, epistle, and gospel, by heart, every Sunday after church. I always do two things at once, when I can, and this strengthens their memory, and teaches them religion at the same time. I never questioned my governess as to religion; it looks narrow-minded; and yet *mine* never dreams of objecting to what I desire."

"I should think not," was Mr Byfield's quiet rejoinder; "strange ideas your children will entertain of the religion that is rendered a punishment instead of a reward."

Mrs Ryal grasped the tassel of her muff, but made no reply.

"Oh," he continued, "here is the pith in a postscript—'As the lady will be treated as one of the family, a high salary will not be given.' Ladies!" exclaimed the old man, "do you not blush at this? You ask for the fruits of an education that, if it be half what you demand, must have cost the governess the labour of a life, and her friends many hundred pounds. It is your DUTY to treat the person who is capable of bestowing upon your children the greatest of earthly blessings as one of your family; and yet you make the doing so a reason for abridging a stipend, which, if stretched to the utmost of what governesses receive, pays a wretched interest for both time and money. Shame, ladies, shame!"

The ladies looked at each other, and at last Mrs Hylier said, "Really, sir, I do not see it at all in the light in which you put it. I know numberless instances where they are glad to come for less."

Tears came into Mrs Gresham's eyes, and Mrs Ryal kicked the ottoman violently.

"The more's the pity," continued Mr Byfield; "but I hold it to be a principle of English honesty to pay for value received, and of English honour not to take advantage of distress."

"Suppose we cannot afford it, sir—am I to do without a governess for my children because my husband cannot pay to one sixty or seventy pounds a-year?"

"But you said just now, madam, that Mr Hylier wished you to pay that sum."

"Yes," stammered the fair economist, "if—if"—

"*If you could manage with one footman,*" said the old gentleman, "instead of two. In my young days, my wife, who had but one child, and we were poor, said to me—'Joseph, our girl is growing up without education, and I cannot teach, for I never learned, but we must send her to school.' I answered that we could not afford it. 'Oh, yes, we can,' she said; 'I will discharge our servant; I will curtail our expenses in every way, because I am resolved that she shall be well educated, and honestly paid for.' It never occurred to that right-minded yet simple-hearted woman to propose lower terms to a governess, but she proposed less indulgence to herself. Thus she rendered justice. She would have worked her fingers to the bone sooner than have bargained for intellect. Ay, Mrs Ryal, you may laugh; but of all meannesses, the meanest is that which depreciates mind, and having no power but that which proceeds from a full purse, insults the indigence which has more of the immaterial world beneath its russet gown than your wealth can purchase."

"My wealth!" exclaimed the offended lady; "*your* wealth, if you please; but though *your* wealth, and your oddity, and your altogether, may awe some people, it *can* have no effect upon *me*, Mr Byfield—none in the world; every one says you are a strange creature."

"My dear Mrs Ryal," said Mrs Hylier, "you positively must not grow angry with our *dear* friend, Mr Byfield; he does not mean half what he says."

"I beg your pardon," interrupted the eccentric old gentleman; "I mean a great deal more. I only wish I had the means of sending forth to the world my opinion as to the inestimable value of domestic education for females. I would have every woman educated within the sanctuary of her own home. I would not loosen the smallest fibre of the affection which binds her to her father's house; it should be at once her altar and her *throne;* but as it is a blessing which circumstances prevent many from enjoying, I would command the legislature of this mighty country to devise some means for the better ordering and investigation of 'ladies' boarding-schools.' To set up an establishment for young ladies is very often the last resource for characterless women, and persons who, failing in every thing else, resort to that as a means of subsistence; whereas such should be under the closest superintendence of high-minded and right-thinking gentlewomen. I look upon the blue-boarded and brass-plated schools that swarm in our suburbs," he added, as he turned away to hide an emotion he could not control—"I look upon them as the very charnel-houses of morality."

Mrs Ryal elevated her eyebrows, and shrugged her shoulders, while the gentle Mrs Gresham whispered her "not to mind; that Mr Byfield was half mad on the subject of schools."

"Ladies," said the old man, apparently recovered from his agitation, and in his usually quiet, calm, yet harshly-toned voice; "ladies, you are, in different degrees, all women of the world; you live with it, and for it, and you are of it; but you are also mothers. And though *your* Ellen, Mrs Hylier, does grow so fast as almost to overtake her mother's beauty, and you, Mrs Ryal, stand in open defiance of vulgar contagion, because you fear a rival in a well-bred governess, and get more time out of your daily labourer than you would expect from your milliner for the same money; and you, Mrs Gresham—but I cannot say to you more than that you all love your children—some more, some less. Still, according to your natures, you *all* love them dearly. So did I mine. My child was all the world to me. I told you what her poor mother did for her improvement—the sacrifice she made. But though we had the longing to secure for her every advantage, we had no skill as to the means of obtaining the knowledge we so desired her to possess. We placed her at a 'first-rate school,' as it was called, and thought we had done our duty; but this going from her home loosened the cords of love that bound her to us. And when a sudden stroke of good fortune converted a poor into a rich man, and we brought our child to a splendid house, we found that our daughter's morals had become corrupted through the means of her companions—an evil the most difficult of all for a governess to prevent—and that she had imbibed moral poison with her mental food." The old gentleman became so agitated, that he could not proceed; and angry as the ladies had been with him a few moments before for a plain-speaking which amounted to rudeness, they could not avoid sympathising with his feelings.

"But we are not going to send our children to a school," suggested Mrs Gresham.

"I know that, madam," he replied; "but I want to convince you, by comparison, of the blessings that await the power of cultivating both the intellect and the affections under your own roof, and so argue you into the necessity for paying honestly, if not liberally, the woman upon the faithful discharge of whose duties depends the *future* happiness or misery of those dear ones whom you have brought into the world. It is now twenty-two years since I saw that daughter; I shall never see her again in this world; I thought I had strength to tell you the story, painful as it is, but I have not. I would have done so, in the hope that I might have shown you how valuable, past all others, are the services rendered by a worthy and upright woman when entrusted with the education of youth; but when I think of my lost child, I forget every thing else. She stands before me as I speak. My blue-eyed lovely one! all innocence and truth—the light, and life, and love of that small four-roomed cottage; and then she loved me truly and dearly; and there again she is—most beautiful, but cankered at the heart, fair, and frail! Lay your children in their graves, and ring the joy-bells over them sooner than intrust them to the whirling pestilence of a large school, or the care of a *cheap* governess!"

"He certainly is mad," whispered Mrs Ryal to Mrs Hylier, while the old gentleman, folding his hands one within the other, walked up and down the room, his thoughts evidently far away from the three wives, who were truly, as he said, "mere women of the world." And yet he was right—they all loved their children, but it was after their own fashion; Mrs Gresham with the most tenderness—she wished them to be good and happy; Mrs Hylier's affection was mingled with a strong desire that they might continue in a state of innocence as long as possible, and not grow too fast. Mrs Ryal had none of that weakness; she did not care a bit whether she were considered old or young, as long as she was obeyed; so she determined her girls should have as little of what is called heart as possible, that they might be free to accept the best offers when they were made. She was continually contrasting riches and poverty. All the rich were angels, and all the poor thieves; there were no exceptions; those who married according to their parent's wishes rode in carriages, with two tall footmen behind each; those who married for love walked a-foot with draggled tails, and died in a workhouse. Of all the women in Kensington, Mr Byfield disliked Mrs Ryal the most, and seeing her at Mrs Hylier's had irritated him more than he cared to confess even to himself. Mrs Ryal entertained a corresponding animosity towards Mr Byfield; she had resolved, come what would, to "sit him out;" but she was afraid, if she remained much longer, that Miss Stack, the daily governess, whose mother was ill, might go a few minutes before her time was up, and she had more than once caught her shaking the hour-glass—so much for the honesty of one party and the consideration of the other; she knew perfectly well that as soon as she was gone, she would be abused "by the old monster;" for she was aware that, if he had gone, it would have given her extreme pleasure and satisfaction to abuse him. The old gentleman had not spoken for several minutes, but continued to walk up and down, pausing every now and then to look at her over his spectacles, as well as to inquire, "when do you mean to take your departure?" Mrs Ryal was too exalted to notice this; but, after consideration, she rose with much dignity, shook hands with her two "dear friends," dropped a most exaggerated curtsy to Mr Byfield, who, the moment she was out of the room, threw himself into an easy chair, and drew a lengthened inspiration, which said plainly enough, "Thank heaven, she is gone!"

"And now, ladies," he exclaimed, "finding that *you* want a governess, I want to recommend one—not to you, Mrs Gresham; notwithstanding 'little Teddy,' she would be too happy with you. I should wish her to live with *you*, Mrs Hylier."

"With me, sir? Why, after the censure you have passed upon us both, I should hardly think you would recommend us a dog, much less a governess."

"I expect you will treat your governess hardly as well as I treat my dog," was the ungracious reply.

"Really, Mr Byfield"——

"Psha, lady!" interrupted the strange old man; "no words about it; I have not been so long your opposite neighbour without knowing that your last governess did not sit at your table; that when you had the hot, she had the cold; that when a visiter came, she went; that she was treated as a creature belonging to an intermediate state of society, which has never been defined or illustrated—being too high for the kitchen, too low for the parlour; that she was to govern her temper towards those who never governed their tempers towards her; that she was to cultivate intellect, yet sit silent as a fool; that she was to instruct in all accomplishments, which she must know and feel, yet never play any thing in society except quadrilles, *because* she played so well that she might eclipse the young ladies who, not being governesses, play for husbands, while she only plays for bread! My good madam, I know almost every governess who enters Kensington by sight; the daily ones by their early hours, cotton umbrellas, and the cowed, dejected air with which they raise the knocker, uncertain how to let it fall. Do I not know the musical ones by the worn-out boa doubled round their throats, and the roll of new music clasped in the thinly gloved hand?—and the drawing ones—God help them—by the small portfolio, pallid cheeks, and haggard eyes? I could tell you tales of those hard-labouring classes that would make factory labour seem a toy; but you would not understand me, though you *can* understand that you want a governess, and you can also understand that I, Joseph Byfield, hope you will take one of my recommending."

The sisters looked at each other, as well as to say, "What shall we do?"

Mrs Hylier assumed a cheerful, careless air, and replied—"Well, sir, who is your governess?"

"WHO she exactly is, Mrs Hylier, I will not tell you; and she does not know, though she imagines she does, *what* she is. I will tell you. She is handsome, without the consciousness of beauty—accomplished, without affectation—gentle, without being inanimate—and I should suppose patient; for she has been a teacher in a school, as well as in what is called a *private* family; but I want to see her patience tested."

"Is she a good musician?"

"Better than most women."

"And a good artist?"

"That was not in the bond; but she does confound perspective, and distort the human body as perfectly as most teachers of 'the art that can immortalise'"——

"My dear sir"——

"Ay, ay; half a dozen chalk heads—a few tawdry landscapes, with the lights scratched out, and the shadows rubbed in—a bunch of flowers on velvet, and a bundle of handscreens"——

"My dear sir," interrupted Mrs Hylier, "these sort of things would not suit my daughters; what they do must be *artistic*."

"Then get an artist to teach them; you go upon the principle of expecting Hertz to paint like Eastlake, and Eastlake to play like Hertz. Madam, she is a well-informed, prudent, intelligent gentlewoman; feeling and understanding well; consequently doing nothing ill, because she will not attempt what she cannot accomplish. She will not undertake to *finish* (that's the term, I think) pupils in either music or drawing, but she will do her best; and as she has resided abroad, I am told (for I hate every language except my own) she is a good linguist; and I will answer for her accepting the five-and-twenty pounds a-year."

"Very desirable, no doubt," muttered Mrs Hylier, unwilling, for sundry reasons of great import connected with her husband, to displease Mr Byfield, and yet most unwilling to receive into her family a person whom, judging of others by herself, she imagined must be a spy upon her *menage*.

"I knew you would so consider any one I recommended," said the old gentleman with a smile, that evinced the consciousness of power; "and when shall the '*young person*' (that is the phrase, is it not?)—when shall she come?"

"I think I should like to see her first," answered the lady, hesitating.

"Very good; but to what purpose? you know you will take her?"

"Any thing to oblige you, my dear sir; but has she no female friend?"

"Some one of you ladies said a few moments ago that a governess had no need of friends."

"You are aware, Mr Byfield, it is usual upon such occasions to consult the lady the governess resided with last; it *is* usual; I do not want to insist upon it, because I am sure you understand exactly what I require."

"Indeed, madam, I do not pretend to such extensive information; I know, I think, what you *ought* to require, that is all. However, if you wish, you shall have references besides mine," and Mr Byfield looked harder and stiffer than ever. He walked up to a small water-colour drawing that hung above a little table, and contemplated it, twirling his cane about in a half circle all the time. The subject was ugly enough to look at—a long chimney emitting a column of dense smoke like a steamer, and a slated building stuck on one side, being a view of the "Achilles saw mills," which Mr Hylier had lately purchased, a considerable portion of the purchase-money having been advanced by Mr Byfield.

"No matter how odd, how rude, how incomprehensible our old neighbour is, Caroline," Mr Hylier had said to his wife only that morning; "no matter what he does, or says, or fancies; if you contradict or annoy him, it will be my ruin."

Her husband's words were forcibly recalled to her by the attitude and look of the old gentleman, and she answered—"Oh, dear no, sir, not at all; one cannot help anxiety on such a subject; and I must only endeavour to make the lady comfortable, and all that sort of thing, although I fear she may complain to you of"——

"No, no, madam," he interrupted; "I do not desire her to be treated in any way better than your former governess; I wish to see how she bears the rubs of life; I *particularly* request that no change whatever be made in her favour; if I wished her to be quiet and comfortable, I

should have sent her to my gentle little friend Mrs Gresham."

Mrs Hylier bit her lip. "Good morning, ladies; when shall Miss Dawson—her name is Emily Dawson—when shall she come?"

"When you please, sir."

"To-morrow, then, at twelve."

He shut the door; Mrs Gresham rang the bell; and Mrs Hylier, in a weak fit of uncontrollable vexation, burst into tears.

"Did you ever know such a savage?" exclaimed Mrs Gresham.

"I am sure *you* have no reason to complain—if it was not for the hold he has over Hylier"——

"I wonder if she is any relation of his?" said Mrs Gresham, who was a little given to romance.

"Not she, indeed; he is as proud as Lucifer, and has money enough to enable him to live in a palace."

"Could it be possible that he intends to marry," suggested Mrs Gresham.

"Marry, indeed; would any man that could prevent it, permit the woman he intended to marry to be a governess? No. I'll trouble my head no more about it; let her come; one is pretty much the same as another; the only thing that really gives me pain is, that Mrs Ryal should have heard so much of it; she's a regular bell-woman; likes to have the earliest information of whatever goes on in the world, so as to be the first to set it going. She was the means of the dismissal of five governesses only last winter, and there is no end to the matches of her breaking. She will declare the girl is—God knows what—if she finds all out."

"Well," said Mrs Gresham, musingly, "after all, it is very odd; only fancy Mr Byfield taking an interest in a governess *at all*. Still, I must insert my advertisement, and I think I might substitute dancing for Greek; they are about equally useful, and one must not be too unreasonable."

"Very considerate and good of you, Fanny," said her sister; "but believe me, the more you require the more you will get; and I am not sure that Mrs Ryal was wrong about the sciences; every day something fresh starts up that no one ever heard of before, and one must be able to talk about it; it is really very fatiguing to keep up with all the new things, and somehow I do not think the credit one gets by the knowledge is half enough to repay one for the labour."

"Mr Gresham says the whole system, or, as *he* calls it, *no* system, of female education is wrong."

"My dear Fanny, how absurd you are! What can men possibly know of female education? There is my husband, a worthy man as ever lived, and yet he will tell you that the whole object of female education should be to make women—now only imagine what?"

"I am sure I do not know."

"Why, good wives and mothers."

"Both ladies laughed, and then Mrs Hylier exclaimed, "to think of my taking any one into my house under such circumstances! But at all events, I must prepare the children for their new *governess*."

POPULAR INFORMATION ON SCIENCE.

INFLUENCE OF COLOUR ON HEAT AND ODOUR.

THE comparative susceptibility of heat shown by bodies coloured in a certain manner, has been familiar to the scientific world since the days of Franklin, who made some ingenious experiments to ascertain the point, by marking the effect of sunshine upon various patches of snow covered by pieces of cloth variously coloured. Sir Humphry Davy also experimented on this subject; but the inquiry was never followed out to definite results, until it fell into the hands of Dr James Stark of Edinburgh. The experiments made by this gentleman, as detailed by him in a paper communicated in 1833 to the Royal Society, are of a remarkably interesting as well as satisfactory nature.

Dr Stark wrapped the bottom of a thermometer in black wool, and sunk it in a glass tube, which he then immersed in water heated to 170 degrees Fahrenheit. He repeated the experiment successively with dark green, scarlet, and white wool, the object being to see with what comparative rapidity the heat of the water would affect the thermometer through the various kinds of wool. The thermometer attained to an equality with the heat of the water in considerably different spaces of time: in the case of the black wool in $4\frac{1}{2}$ minutes, the dark green in 5 minutes, the scarlet in $5\frac{1}{2}$ minutes, and the white in 8 minutes—the advance towards the highest point being in each case, as might be expected, gradual and proportionate. In some other experiments, varied as to the mode and the substances used, similar results were obtained—the susceptibility being always greatest in the black, next less in the green, next less in the scarlet, and least of all in the white. These results were strictly conformable to those found by both Franklin and Davy, who give the following list of colours, in the order of their various degrees of susceptibility of heat—*black*, deep blue, lighter blue, *green*, purple, *red*, yellow, *white*.*

Dr Stark proceeded to investigate more strictly than had formerly been done the effect of colour on the radiating powers of bodies. Radiation of heat, the unscientific reader will observe, is the reverse of absorption of heat. A body which absorbs heat readily, will be warm while the heat continues to operate upon it; a body which radiates heat readily, tends quickly to become cold. The heat in the one case leaves the body slowly, in the other rapidly. It becomes, of course, of importance to ascertain if bodies which receive or absorb heat readily, also give it out or radiate it readily. On this point Count Rumford made experiments which settled the question in the affirmative; or, what is the same thing, he ascertained "that those substances which part with heat with the greatest facility or celerity, are those which acquire it most readily, or with the greatest celerity." * Dr Stark was curious to learn if this doctrine held good with those variously coloured bodies, which he had ascertained to be absorptive in proportion to the intensity of their colours. Reversing the former experiments, he found black wool fall from 180 to 50 degrees Fahrenheit in 21 minutes, red wool in 26, and white in 27 minutes. He coloured wheat flour, and found black descend through the same range in $9\frac{5}{6}$ minutes, brown in 11, yellow in 12, and white in $12\frac{1}{4}$ minutes. The same results were found with the ball of an air-thermometer variously coloured; so that he considered himself as having demonstrated that "differently coloured substances possess a specific influence on the absorption of heat or caloric, both luminous and non-luminous; and that they give off their caloric in the same ratio as they absorb it."

Dr Stark's remarks on this conclusion are of great value. "The demonstration," he says, "of the influence of colour on the absorption and radiation of caloric, may tend to open up new views of the economy of nature, and perhaps suggest useful improvements in the management and adaptation of heat. Dr Franklin, who never lost sight of practical utility in his scientific investigations, from the result of his experiments with coloured cloths on the absorption of heat, drew the conclusion, 'that black clothes are not so fit to wear in a hot sunny climate or season as white ones, because in such clothes the body is more heated by the sun when we walk abroad, and is at the same time heated by the exercise; which double heat is apt to bring on putrid dangerous fevers;' that soldiers and seamen in tropical climates should have a white uniform; that white hats should be generally worn in summer; and that garden walls for fruit-trees would absorb more heat from being blackened.

Count Rumford and Sir Everard Home, on the contrary, come to a conclusion entirely the reverse of this. The count asserts, that if he were called upon to live in a very warm climate, he would blacken his skin or wear a black shirt; and Sir Everard, from direct experiments on himself and on a negro's skin, lays it down as evident, 'that the power of the sun's rays to scorch the skins of animals is destroyed when applied to a dark surface, although the absolute heat, in consequence of the absorption of the rays, is greater.' Sir Humphry Davy explains this fact by saying, 'that the radiant heat in the sun's rays is converted into sensible heat.' With all deference to the opinion of this great man, it by no means explains why the surface of the skin was kept comparatively cool. From the result of the experiments detailed, it is evident, that if a black surface absorbs caloric in greatest quantity, it also gives it out in the same proportion; and thus a circulation of heat is, as it were, established, calculated to promote the insensible perspiration, and to keep the body cool. This view is confirmed by the observed fact of the stronger odour exhaled by the bodies of black people.

The different shades of colour by which races of men inhabiting different climates are distinguished, equally possess, there is reason to believe, the quality of modifying the individual temperature, and keeping it at the proper mean. This adaptation of colour may perhaps be traced in the inhabitants of every degree of latitude, and be found to correspond with the causes which limit the range of plants and animals. The effect of exposure to the sun in our own country in warm seasons, is temporarily to change the colour of the parts submitted to its influence, and to render them less susceptible of injury from the heating rays.

The influence of colour as modifying the effects of heat, is also strikingly illustrated in other classes of the animal kingdom. The quadrupeds, for instance, which pass the winter in northern latitudes, besides the additional protection from cold they receive in the growth of downy fur, change their colour on the approach of the cold season. The furs of various hues which form their summer dress are thrown off, and a white covering takes its place. Hence the white foxes, the white hares, and the ermine of the arctic regions. Even in more temperate climates, and in our own country, the hare in severe winters often acquires a white fur; and the stoat, or ermine, is found with its summer dress more or less exchanged for a winter clothing of pure white. Some writers on natural history state these changes as means of protection to the animals from their enemies, by assimilating their colour to the winter snow. Without denying that this may be one cause for the periodical change of colour, I am rather disposed to consider it as accommodating the animal to the changes of season it undergoes. The white winter coating, as is evident from the experiments detailed, does not throw off heat so rapidly as any of the other colours; and hence its use in preserving the animal temperature.

The feathered tribes which inhabit northern latitudes afford still more remarkable instances of the adaptation of colour to the changes of temperature. The summer dress of many families is so different from their winter plumage, as to have led many ornithologists to multiply species, as the animal was described in its winter or summer plumage. The ptarmigan is a familiar example. Mr Selby remarks, that 'the black deep ochreous yellow plumage of the ptarmigan in spring and summer gradually gives place to a greyish white; the black spots become broken, and assume the appearance of zig-zag lines and specks. These, again, as the season advances, give place to the pure immaculate plumage which distinguishes both sexes in winter.'

The display of colours in the plumage of the birds of tropical climates is also in strict accordance with the observed facts of the influence of colour over the absorption and radiation of heat. The metallic reflections and polished surface of the whole family of hummingbirds are admirably suited to their habits; and the colours of the wings of the Lepidoptera, in the class of insects, there is little doubt, serve some similar purpose, in maintaining the temperature of the animals at the proper mean. In proportion to the diminution of temperature and the distance from the equator, a corresponding dilution of colour in animals takes place, till in temperate countries it is almost uniformly of a sober grey. In the arctic regions, all colour except white and black disappears—modifications of which, with very little variety of other colours, form the summer and winter clothing of most of the northern tribes of birds.

In the vegetable kingdom, I am disposed to believe that the colours of the petals of flowers serve some useful purpose in regard to preserving the temperature of the parts necessary for reproduction at the proper mean, and that the varied pencilling of nature has thus an object beyond merely pleasing the eye. In this view, the quality of colour, so widely extended, and so varied and blended in every class of natural bodies, acquires a further interest in addition to its ministering to the pleasures of sight, and affords a new instance of that benevolence and wisdom by which all the arrangements of matter are calculated to excite and gratify the mind directed to their investigation.

Even in the inorganic portion of nature, and in northern climates, the portion of heat imbibed by the soil during a short summer, is prevented from escaping by the covering of snow which falls in the beginning of winter; and thus the temperature necessary for the scanty vegetation is kept up. By this white covering, vegetables are enabled to sustain a lengthened torpidity, without suffering from the injurious effects of frost; and the ground is preserved from partial alternations of temperature, till the influence of the sun at once converts the northern winter into summer, without the intervention of spring."

In his investigations of the effect of colours in causing bodies to be more susceptible of odours, Dr Stark had much less aid from the inquiries of preceding philosophers. His attention being drawn to the subject by accident, he began a course of experiments, by putting a small quantity of black wool (ten grains), and an equal of white wool, into a close vessel beside some camphor—also similar quantities of each into a close drawer beside assafœtida—and found in both cases that the black had palpably become the most odorous. He repeated the experiment with cotton wool, and found the same result. Other experiments, in which red was introduced, gave to it, as far as the ordinary sense could judge, a medium degree of odorousness. Afterwards, he experimented with a variety of colours, and found the degrees of odorousness to be in the following order—black, blue, red, green, yellow, and white, which is nearly the order in Franklin's experiments respecting the heat-absorbing powers of bodies. He then tried black and white wool against black and white cotton, and found the black wool more odorous than the black cotton, and the white wool than the white cotton. It is to be observed, that he called in the senses of many persons to test the degrees of odorousness in all these experiments; yet, as no exact knowledge could be thus attained, he became "desirous that, if possible, at least one experiment should be devised, which would show, by the evidence of actual increase of weight, that one colour invariably attracted more of any odorous substance than another." "Upon considering," he adds, "the various odorous substances which could be easily volatilised without change, and whose odour was inseparable from the substance, I fixed upon camphor as the one best suited to my purpose. In an experiment of this nature, it was necessary that the camphor should be volatilised or converted into vapour, and that the coloured substances should be so placed as to come in contact with the camphor while in that state. It was therefore of the first importance to prevent currents of air within the vessel in which the experiment was conducted; and with this view I used a funnel-shaped vessel of tin plate, open at the top and bottom. This rested on a plate of sheet iron, in the centre of which the camphor to be volatilised was placed. The coloured substances, after being accurately weighed, were supported on a bent wire, and introduced through the upper aperture. This was then covered over with a plate of glass. Heat was now applied gently to volatilise the camphor; and when the heat was withdrawn and the apparatus cool, the coloured substances were again accurately weighed, and the difference in weight noted down."

Proceeding in this manner, Dr Stark went over all his former experiments, and invariably found an increase of weight, to a small but scientifically appreciable extent, *in proportion to the depth of colour, and more in wool than in cotton, and more in silk than either*

* To speak precisely, Davy omits the lighter blue and purple from the series.

* Philosophical Transactions, 1804, p. 95.

Of the select experiments which he details, we cannot give even a selection; but, by way of specimen, we may mention that he found white, red, and black wool increased in weight respectively $\frac{3}{10}$, $\frac{8}{10}$, and $1\frac{4}{10}$ grains, and white cotton increased $2\frac{7}{10}$, white wool $2\frac{7}{10}$, and white silk $3\frac{4}{10}$ grains. "The general conclusion would appear to be, that animal substances have a greater attraction for odours than vegetable matters; and that all these have their power much increased by their greater darkness or intensity of colour. These experiments seem also to establish, that the absorption of odours by coloured substances is regulated by the same law which governs the absorption of light and heat. The analogy goes still further; for in other experiments made with a view to ascertain this point, I invariably found that the power of colour in radiating or giving out odours, was in strict relation to the radiation of heat in similar circumstances." Dr Stark also experimented on this point with equally satisfactory results. For example, he "took pieces of card, coloured, as before, black, dark-blue, brown, orange-red, and white, and after having exposed them to the vapour of camphor, in the usual manner, they were taken out of the vessel, weighed, and left in the apartment for twenty-four hours. Upon carefully re-weighing the cards at the end of this period, it was found that the black had lost one grain; the blue nearly as much; the brown $\frac{3}{10}$ths of a grain; the red $\frac{6}{10}$ths; and the white $\frac{4}{10}$ths of a grain. In about six hours after this, the black and blue had completely lost their camphor; the brown and red had the merest trace, inappreciable to a delicate balance; while the white still retained about $\frac{1}{10}$th of a grain."

It will readily occur to many minds, that these experiments afford grounds for some practical procedure with respect to the noxious emanations producing infection. It must appear likely that a white dress of cotton is the one in which a person could most safely go into an infected place. In fact, the Turkish quarantine regulations proceed upon this assumption in part, woollen clothes being held by them as in a higher degree dangerous than those composed of cotton. Dr Stark thinks it not unlikely that, amongst the measures taken to avert cholera in this country, the white-washing of houses was the most efficacious. Fumigations, he remarks, could only have a temporary influence; but "white-washing, although it had no specific effect on the contagious effluvium, yet, by constantly presenting a reflecting surface, prevented the absorption of the emanations by the walls, and thus tended, with moderate ventilation, to keep the air of the apartments pure. Dirty dark-coloured walls, on the contrary, would readily, as has been demonstrated, absorb noxious odours, and, as soon as the effect of fumigation was over, gradually give them out again."

"Next, therefore," he adds, "to keeping the walls of hospitals, prisons, or apartments occupied by a number of individuals, of a white colour, I should suggest that the bedsteads, tables, and seats, should be painted white, and that the dress of the nurses and hospital-attendants should be of a light colour. A regulation of this kind would possess the double advantage of enabling cleanliness to be enforced, at the same time that it presented the least absorbent surface to the emanations of disease.

On the same principle, it would appear that physicians and others, by dressing in black, have unluckily chosen the colour of all others most absorbent of odorous exhalations, and of course the most dangerous to themselves and patients. Facts have been mentioned which make it next to certain that contagious disease may be communicated to a third person through the medium of one who has been exposed to contagion, but himself not affected; and, indeed, the circumstance of infectious effluvia being capable of being carried by medical men from one patient to another, I should conceive one of the means by which such diseases are often propagated, in the ill-ventilated and dirty habitations of the poor exposed to their influence."

VALUE OF STATISTICAL REGISTERS.

A faithful register of births, marriages, and deaths, is wished for by enlightened philanthropists of all advanced countries, far more as a test of national morals and the national welfare, than as a matter of the highest social convenience. For this the physiologist waits as the means of determining the physical condition of the nation; as a guide to him in suggesting and prescribing the methods by which the national health may be improved, and the average of life prolonged. For this the legislator waits as the means of determining the comparative proneness of the people to certain kinds of social offences, and the causes of that proneness; that the law may be framed so as to include (as all wise laws should include) the largest preventive influence with the greatest certainty of retribution. For this the philanthropist waits, as a guide to him in forming his scheme of universal education; and without this---without knowing how many need education altogether---how many under one set of circumstances, and how many under another---he can proceed only in darkness, or amidst the delusions of false lights. He is only perplexed by the partial knowledge, which is all that his utmost efforts enable him to obtain. The comparative ages of the dead will indicate to him not only the amount of health, but the comparative force of various species of disease; and from the character of its diseases, and the amount of its health, much of the moral state of a people may be safely pronounced upon. The proportion of marriages to births and deaths is always an indication of the degree of comfort enjoyed, and of the consequent purity of morals; and, therefore, of the degree in which education is present or needed. A large number of children, and a large proportion of marriages, indicate physical and moral welfare, and therefore a comparative prevalence of education. A large number of births, and a small proportion of marriages, indicate the reverse. When these circumstances are taken in connexion with the prevailing occupations of the district to which they relate, the philanthropist has arrived at a sufficient certainty as to the means of education required, and the method in which they are to be applied.---*Miss Martineau's "How to Observe."*

[We add to the above, that England now possesses an admirable system of registration, such as is here pointed out. Scotland, however, is still without any national arrangements on the subject. Parishes possess registers of baptisms, but not of births; registers of proclamations of marriages, but not of the solemnisation of marriages; registers of burials, but not of deaths. In such a disgracefully loose state of affairs, the statistics of births, marriages, deaths, calculations as to public health, and many other matters equally useful, cannot possibly be made up.]

A FEW WEEKS ON THE CONTINENT.

MORAT—LAUSANNE.

I MUST now invite the reader to accompany us in our excursion from Berne to Morat—a place off the usual route of tourists, as the country in this quarter has little to boast of in the form of romantic scenery, but which I preferred taking to any other on the way to Lausanne, for the purpose of visiting what has for several centuries been one of the chief historical scenes of Switzerland.

Our journey lay in a south-westerly direction from Berne, through a generally well-cultured district, with substantial farm-houses, neatly kept enclosures, and roads as excellent as are to be found in any part of the world. On all sides were evidences of harvest having been gathered into the barns; the clanking sound of the flail, though perhaps not what would have called forth the admiration of our political economists, came at intervals pleasingly on the ear, as an evidence of rural wealth and industry; and on the open slopes, shone upon by a bright morning sun, men, women, and children, were busily preparing the ground for new crops of grain. Early in the forenoon we crossed the Sarine, a large tributary of the Aar, by an old-fashioned wooden bridge, and shortly afterwards entered the canton of Freyburg. An hour later brought us to the ancient little town of Morat, a kind of rude imitation of Berne on a small scale, with arcades beneath the houses. From sundry appearances, however, we were glad to see that the spirit of improvement had reached the place; the gates had been removed, the fosse filled up, and various parts of the old walls, which had done duty in more troublous times, were taken down.

Morat stands close upon the eastern margin of a lake of the same name, the opposite shore of which is a low hill, separating it from the Lake of Neuchatel, and terminating in a morass on the north. The scenery, comparing it with other parts of the country, is altogether spiritless, and the sole interest is derived from historical associations; for on the unromantic banks of this sheet of water took place the greatest of the martial achievements which contributed to secure Swiss independence. The previous efforts to rid the country of its intruders had been directed principally against the dukes of Austria; on this occasion, the mountaineers were called on to battle with a new and still more audacious foe, Duke Charles of Burgundy, who, on the plea that they were allies of Louis XI. of France, desired to bring them to that kind of subjection to which he had already reduced the rebellious Liegeois. This infamous encroachment on the rights of a people with whom he had no proper concern, was made in the year 1476; and never, in the whole annals of human strife, was an invader so justly punished. The war commenced by an attack on the small fortified town of Grandson, situated near the southern extremity of the Lake of Neuchatel, which having captured, he put its 800 defenders to death, by causing them to be stripped and hung upon the trees of the neighbouring forest. In two days later, was fought the famous battle of Grandson, in which the confederated army of Swiss, by adroitly hemming in the Burgundians close upon the lake, and attacking them from the lower slopes of the Jura, completely defeated them, with an immense slaughter. Charles left 50,000 men, and all his valuable equipage, behind him, and fled through the mountains with only a few personal followers. Arrived at Nozeroy, and writhing under the humiliation of so signal a defeat, he gave himself up to despair, saw no one, drank deeply in solitude, and became almost insane. At length, however, he regained his activity, and meditating solely on vengeance, he re-assembled at Lausanne an army of upwards of 40,000 men, with which he advanced upon Morat.

It was the scene of the extraordinary exploit which occurred on this occasion, that we had now come hither to examine.

The battle-field of Morat lies at the distance of rather more than an English mile south from the town, and we proceeded towards it by the high road to Freyburg, with the wide-expanded waters of the lake on our right, and a fine sloping hill partitioned into well-cultivated fields, and ornamented with trees and cottages, on our left. It was on the face of this now tranquil upland, from its summit to the edge of the lake, that the heat of the conflict took place. With our backs towards the town, and in front the line of country through which Charles's forces were marched forward to their well-merited doom, we could easily picture the details of this celebrated encounter, of which I shall allow the Swiss historian, Zschokke, to give his short and pithy account. Speaking of the defence offered by Morat to the progress of the Burgundians, he observes—"Adrian de Bubenberg, with 600 soldiers, and the inhabitants of the town, made a still more obstinate and effectual resistance than had been done by the defenders of Grandson. Whilst the duke thus found himself arrested in his course, the confederates and their friends once more collected their forces. Morat was by this time in imminent danger. Breaches had been made in the walls and towers, and the rampart had given way; but the courage of Bubenberg, and the heroes commanded by him, remained unshaken, and they held out firmly until they beheld the arrival, from all sides, of the confederates and their allies from Bienne, Alsace, Basil, St Gall, and Schaffhausen. These were the first to come forward. Upon their steps, in spite of the inclement weather and the bad roads, marched in haste the men of Zurich, Thurgovie, Argovie, and Sargans. John Waldmann, leader of the Zurichois, arrived at Berne on the eve before the battle, and granted to his jaded troops only a few hours of repose. At the hour of ten at night, the bugle sounded for the resumption of the march. The city of Berne was illuminated on the occasion, and tables were spread out before every house for the refreshment of the patriot soldiery. The route was taken for Morat amid the darkness of night, and in the face of a storm of wind and rain.

The day dawned; it was the 22d of June; the sky was overcast with clouds, and the rain still fell in torrents. The Burgundians displayed their vast lines before the eyes of the Swiss, who numbered scarcely 30,000 combatants. Before giving the signal of attack, John de Hallwyl fell on his knees, with his whole army, to invoke the assistance of the Almighty in this trying moment for their beloved country. While they prayed, the sun broke through the clouds, and, on the instant, the Swiss commander arose: waving his sword aloft, he exclaimed—'Rise, rise, confederated brethren! God smiles upon our coming victory!' As he spoke, the clang of arms resounded; the attack was made; and soon the battle raged from the heights to the lake. Hallwyl commanded on the left; on the right was engaged the flower of the Swiss army, under the orders of John Waldmann; and Adrian de Bubenberg had the guidance of the troops stationed amid the trees on the shores of the lake. Hallwyl had to sustain a fearful struggle, and he did sustain it, till he beheld the appearance of the white-haired chief of Lucerne, Gaspard de Herstenstein, on the rising ground behind the enemy. Death now rioted in the ranks of the Burgundians; in front and in rear they were massacred; thousands battled obstinately, thousands fell, and thousands took to flight. The duke, pale and dismayed, seeing that all was lost, fled with a train of scarcely thirty attendants, and reached the banks of Lake Leman. Fifteen thousand of his troops lay on the plain of Morat, in its lake, and in the town of Avenches. A great number, seeking to save themselves, had perished in the waters and neighbouring marshes; the rest were completely dispersed. The tents, provisions, and treasures of the enemy, became the prize of the victors. The dead were thrown into pits amid quick-lime, and earth spread over them."

Some years afterwards, the citizens of Morat formed a collection of the bones of the Burgundians, as a warning to those who might afterwards attempt the

conquest of Switzerland. Four years later, they erected a monumental chapel, in which also were reassembled many of the bones of the fallen. For three centuries this memorial of Swiss heroism remained entire, and was in existence in 1797, when Bonaparte, after the treaty of Campo-Formio, visited the spot on his way to the congress of Rastadt. "Young captain," said he to a Swiss officer who accompanied him, "be assured that if we ever fight in this spot, we will not take the lake in our retreat." In the following year, during the French invasion of Switzerland, a Burgundian regiment destroyed the monument, and threw the bones into the lake, whence some of them were ejected upon the shores, during every successive storm. From this time, the relics of the slain became a marketable commodity. They were picked up, and carried off to be sold to strangers, or to make handles for knives, for which their whiteness adapted them. In the course of his rambles Lord Byron visited the scene, and carried away what he described as perhaps forming the quarter of a hero; observing, as an apology, that if he had not himself committed this species of sacrilege, the next comer would most likely have been guilty of it, and for a more sordid purpose: the bones he designed to preserve with the most religious care.

The overturned monument was at first replaced by a tree of Liberty; to this succeeded a linden tree, surrounded by a railing. But on the 9th of January, 1821, the cantonal authorities of Freyburg voted a sum of 6000 francs for the erection of an obelisk on the spot. This was duly accomplished, and now a remarkably handsome obelisk of sandstone, apparently about forty feet in height, is seen standing on an open gravelled space, adjoining the public road, and overlooking the large expanse of lake. On one of its sides is an inscription in Latin, expressing that—"The Republic of Freyburg signalises the victory of the 22d of June, 1476, gained by the united efforts of their ancestors, by this new monument, erected in the year 1822."

I am afraid I have detained the reader with these scraps of old-world history; but surely one may well be excused for pausing for a moment over a scene so intimately associated with the independence of a brave and free people. Morat was the Bannockburn of Switzerland, for the confederated cantons now assumed a political standing from which they were never afterwards driven—although, it may be remarked, they did not rid themselves of the German emperors till 1499, or wrench Vaud and Geneva from the dukes of Savoy till 1536. In the meanwhile, what became of Charles the Bold of Burgundy? His sun set on the plain of Morat. In about half a year after, in an equally futile attempt on Lorraine, he perished ingloriously at the battle of Nancy (January 7, 1477), when his forces were utterly destroyed; his body was found a few days afterwards, immersed among ice and mud in a ditch, and so disfigured that he was only recognised by the length of his beard and nails, which he had allowed to grow since the period of his defeat at Morat. The page of history presents few more striking instances of the retributive punishment of inordinate pride, ferocity, and ambition.

After having seen what was worthy of observation in this part of the country, there was nothing to detain us, and we proceeded by an afternoon's ride to Neuchatel—a fine old town in the French style, situated at the base of the vine-clad Jura, and close upon the lake of the same name. As it was afterwards our fortune to take this city, and the district of country beyond it among the mountains, in our journey into France, I shall here postpone any notice of them, and proceed with the reader on the way to Lausanne. The first part of the journey we performed on board a small steam-boat, which, in from three to four hours, carried us to the farther extremity of the lake at Yverdun—a substantial but dirty town, and the first we came to in the canton of Vaud. Here, it will be remembered, the benevolent but whimsical Pestalozzi attempted to carry his educational projects into execution, and failed—more, however, from want of management than any substantial defect in principle.

The country betwixt Yverdun and Lausanne may be said to consist of an enormously broad hill, not particularly high, but toilsome enough to the cattle whose duty is to drag up the diligence. The land is cultivated to the summit, and for several miles we have a view to the right of the beauteous flat vale stretching southwards from the Lake of Neuchatel towards Lake Leman; and beyond it, the whole face of the Jura range, with its lofty peaks shrouded in mists, and forming the great physical barrier between France and Switzerland. Before us one small height succeeds another, each tantalising us with the hope of our being able to catch from its summit the first glimpse of Lake Leman, or Lake of Geneva, as it is sometimes and not very correctly called, whose banks were to be the limit of our pilgrimage. The lake, however, is not seen till we are almost upon it, and within a mile or so of Lausanne, when, all at once, this glorious sheet of water, an inland sea in appearance, is seen lying in the depth in front glittering under the intense splendour of the mid-day sun—its northern shore on which we are, a scene of soft variegated beauty—vineyards, cottages, and white tranquil villas, extending as far as the eye can reach, and contrasting singularly with the dark, cheerless country on the opposite coast, marked by the long rugged line of the Savoy mountains, in the bosom of which Mont Blanc, with its serrated snowy scalp, rests in solemn majesty. From Villeneuve on the east—where the waters of the Rhone have cleft for themselves a passage through a rampart of huge rocky eminences, and found room to expand in the bosom of the still lake in front—as far as to the neighbourhood of Geneva on the west, a compass of forty miles, where the lake has similarly forced an outlet through the intercepting flanks of the Jura, this fascinating landscape is spread out before us. The first view of the shores of Lake Leman, combining as they do, to an almost unexampled degree, the beautiful with the sublime, and associated with many highly interesting recollections, is felt as a realisation of many of those pleasing dreams and fancies with which hope is always kindly alluring us onward through life, but which sober judgment as frequently tells us must ever retain, for the most part, their native insubstantiality. Once seen, it is a thing not easily to be forgotten; and to those who treasure such remembrances, it will mark an era in existence.

Our party reached Lausanne at noon, somewhat glad to get off the dusty roads, and to seek shelter from the overpowering heat. But no sooner had we fixed our quarters at that prince of hotels, the Hotel Gibbon*—which I take upon me to pronounce unmatched for every excellent quality by any other house in Christendom—than there was no rest till we had seen all the outs and ins of the town—its beautiful promenades and very ancient cathedral—and, in particular, the house in which Mr Gibbon had resided during his stay at Lausanne, and, as is well known, wrote his "Decline and Fall of the Roman Empire." This edifice is almost close to the hotel which has taken the distinguished author's name; and to understand its site, we must first take a glance at the general character of the place.

Lausanne, the capital of Vaud, occupies an awkward situation on the summits and declivities of two or three broad knolls, the southern face of which forms a descending slope of at least a mile to the village of Ouchy, on the margin of the lake. The streets are irregular, though beginning to be improved in various ways; the greatest of all the improvements going forward being the erection of a splendid bridge of twenty-two arches, designed to connect the main street with the open high ground on the north—that by which we had entered from Yverdun. This great work, which is to cost the canton 500,000 francs—not bad for a small republic, the size of an English county—and is forming of hard blue stone, imported from the opposite shores of Savoy, will be of incalculable service as an approach; for hitherto the only entrance to the town, in this direction, has been by a street of such excessive steepness that the diligence does not attempt to face it. When finished, the new thoroughfare will run up straight to the door of the Gibbon—a good thing for the landlord, who takes a particular interest in the undertaking, and kindly volunteers a great deal of local chat on the subject to his English customers, who may be in the proportion of ninety-nine in every hundred who enter his establishment.

The house once occupied by Gibbon is situated towards the rear of the hotel which has adopted his name, at the side of the long descending road which proceeds to Ouchy, and separated from the main street by the old church of St Francis. It is an antique dwelling of the French fashion, with plastered walls and dark-tiled roof, offering only one storey to the small courtyard in front, but, from the steepness of the hill, making two storeys behind. It is at present inhabited by a private family, one of whose domestics conducted us over the premises. The most interesting point is in the garden, to which we are conducted by a stair and winding passage, opening upon the berceau walk which formed the author's favourite promenade during the composition of his great work.

No garden scene can be conceived more delicious than this little spot—a trimly-kept walk, shaded with green acacias in full leaf; borders of flowers and orange-trees, enriching the air with their perfume; the walls of the house and terrace beyond covered with vines and fig-trees, each with its clusters of fruit; above all, glimpses through the bushes of the long descending slope towards the lake—disclosing a universal vine-garden, while in the distance the scene is closed with the chain of the Savoy peaks. Such was the spot occupied for several years by Gibbon, while writing his immortal production; and here, in an arbour at the extremity of the walk, which has unfortunately been removed in the progress of adjoining improvements, did he finish his undertaking. His own words will doubtless recur to remembrance: "It was on the day, or rather the night, of the 27th of June 1787, between the hours of eleven and twelve, that I wrote the last line of the last page in a summer-house in my garden. After laying down my pen, I took several turns in a berceau, or covered walk of acacias, which commands a prospect of the country, the lake, and the mountains. The air was temperate, the sky serene, the silver orb of the moon was reflected from the waves, and all nature was silent."

Lausanne may be said to form the centre point in a district whose fate it has been to afford a residence to many individuals distinguished for their literary abilities, and acquirements in various branches of learning. On the west, not to speak of Geneva, lies Ferney, long the seat of Voltaire, and near it Coppet, the residence of Necker and his illustrious daughter Madame de Staël; while on the east is Clarens, the abode of Rousseau. Lord Byron, whose passionate lines on Lake Leman, in calm and storm, require no repetition, resided at different places on its shores; among others at Diodati, near Geneva, where he wrote his "Manfred," and the third canto of "Childe Harold;" and Ouchy, below Lausanne, where he composed his "Prisoner of Chillon." Not the least remarkable circumstance in the history of Lake Leman is, that all its numerous admirers—Byron, when at Diodati, excepted—have taken up their abode on its northern or Swiss side. At the *côté roti*, or side offered to the full influence of the summer sun, the northern shore is unquestionably not only the most genial but every way the most beautiful. There is, however, another cause of preference. It has long enjoyed all the benefits of civil and religious liberty, whereas the territory on the south is under one of the most thorough despotisms in Europe—that of the Sardinian monarchy. A residence of a few days on the lake enabled us to observe the striking difference between these two conditions. Looking out from the heights of Lausanne, you see all along the Swiss side incontestible evidences of civilisation, comfort, and industry—ports with their small sailing craft, and steamers darting from point to point, leaving and taking up passengers. On the opposite shore all seems dull, antiquated, and unimproved; the bulk of the country bleak and desolate, while not a single visit is permitted by steam-vessels at any of the small lake-side towns. A more close and vivid contrast between a country managed by its own people, and one under the government of others, could scarcely be more affectingly exhibited.

Perhaps no part of Europe has undergone so many political changes as the modern canton of Pays de Vaud, stretching along the northern shore of Lake Leman. One after the other, it has been possessed and domineered over by Romans, Franks, Burgundians, the emperors of Germany, the dukes of Zähringen, the counts of Kyburg, the barons of Vaud, and dukes of Savoy, and bishops of Lausanne.* In 1536, the Bernese, by force of arms, as already mentioned, wrested the district from the reigning dukes of Savoy—of whose cruelties we shall have something to say when we reach Chillon—and henceforth it became a part of the canton of Berne till 1798, when it was rendered independent as a part of the Helvetian republic. In 1803, by the act of mediation of Napoleon, this republic was dissolved, and Vaud now became a distinct canton in the Swiss confederacy. This lasted till 1814, when it lost partly its democratic constitution, and fell under the jurisdiction of certain privileged orders. In 1830, this preposterous arrangement was overturned by a revolution; and the canton, in its independent state, became what it now is—a free democracy like that of Berne, Zurich, and the other revolutionised cantons. This part of Switzerland, therefore, has had a remarkable luck for changes, but in the main for the better. Settled very much by a people of a similar origin to that of the French, and having frequently had an intimate connexion with France, its vernacular language is French, in which respect it resembles Neuchatel, part of Freyburg, and Geneva. With the latter canton it embraced the Reformation with great zeal, and is now distinguished as one of the freest Protestant cantons. Yet, as in all other countries over which the French Revolution swept with fury, religion is little better than the ghost of what it was in former times. Nevertheless, the canton is a pattern of order, decency of behaviour, and also respectability of appearance in its people; while its social economy embraces the fact, puzzling to our political economists, of a population which increases not beyond the means of subsistence, and consequently does not exhibit any thing like those sinks of misery which are now plenteously dotted over the surface of English society. Since the revolution of 1830, the canton has been eminently prosperous in its affairs, and improvements are seen effecting in all quarters. Education is liberally promoted; all forms of worship are freely exercised—a very beautiful

* The French, who systematically misspell and mispronounce foreign proper names, call this the *Hotel Hi-bon*. A stranger at first has a difficulty in knowing who they mean by *Hi-bon*.

* According to local historians, the bishops of Lausanne were a powerful set of prince-prelates, whose spiritual influence was not limited to the human species, but extended also over the tribes of lower animals. In 1479, the country around Lausanne was, it appears, infested by a host of insects, which ravaged the roots of the plants, everywhere causing serious inconvenience and loss. This unforeseen and alarming pest was reported by Frikart, the Chancellor of Berne, to the Bishop of Lausanne, counselling his lordship to have the intruders summoned before his tribunal, and there be made to answer for their conduct. The suggestion appeared reasonable; and to give the animals every chance of justice, an advocate of infamous character, recently deceased, was appointed to conduct their case. The day set apart for the trial arrived, and the suit came to a hearing; but as the advocate for the defendants did not make his appearance, the insects were pronounced contumacious, and judgment went against them. "Les insects furent excommuniés, proscrits au nom de la Sainte Trinité, et condamnés à sortir des toutes les terres du diocese de Lausanne."—(The insects were excommunicated, proscribed in the name of the Holy Trinity, and condemned to banishment from every part of the diocese of Lausanne.) This order, it is mentioned, still exists in its original form. The historians of Berne, who have transmitted the fact, do not seem to have considered it any way remarkable; and only observe that, according to custom, the sentence had the effect of remedying the evil!

English chapel at Lausanne being one of the tangible evidences of this freedom of opinion; and, in short, the country seems to be pursuing a fair course of national and individual prosperity.

WORDSWORTH'S NEW POEMS.

A NEW volume from the pen of William Wordsworth, is a gift which the public will now receive with general gratitude. The meed of popular favour was for a time withheld from the poet of Rydal, and chiefly in consequence of his own unfortunate promulgation of certain laws of literary composition, to which the world at large could not give their assent; but it was ultimately found, that though he observed these rules in a few instances, as in the case of the "Idiot Boy," "Harry Blake and Goody Gill," and some other short pieces, the majority of his poems were modelled after the loftiest exemplars of our language, and had few parallels in it, whether as regarded dignity of diction or elevation of thought. The effect of the mistake under which the public laboured with respect to Mr Wordsworth, is partly shown by the present volume, which contains many pieces composed long ago, and which the writer has only at the eleventh hour been encouraged to give to the public. Among other productions, we find here the "Tragedy of the Borderers," written in 1795–6, and respecting which great curiosity has been felt by the poet's admirers, its existence having been very generally known for many by-past years.

As the volume only adds to the amount of Mr Wordsworth's works, and gives no novelty in any other respect, it is scarcely necessary, except for form's sake, to present any specimens of its contents. We are tempted, however, to transfer to our columns one or two pieces or passages which have fallen upon our own feelings with an effect peculiarly Wordsworthian, and which we have no doubt will give equal pleasure to our readers. One of these is the conclusion of a poem entitled "Musings near Aquapendente," written during a tour in Italy.

"Time flows—nor winds,
Nor stagnates, nor precipitates his course,
But many a benefit borne upon his breast
For human-kind sinks out of sight, is gone,
No one knows how; nor seldom is put forth
An angry arm that snatches good away,
Never perhaps to reappear. The Stream
Has to our generation brought, and brings,
Innumerable gains; yet we, who now
Walk in the light of day, pertain full surely
To a chill'd age, most pitiably shut out
From that which *is* and actuates, by forms,
Abstractions, and by lifeless fact to fact
Minutely linked with diligence uninspired,
Unrectified, unguided, unsustained,
By godlike insight. To this fate is doom'd
Science, wide-spread and spreading still as be
Her conquests, in the world of sense made known.
So with the internal mind it fares; and so
With morals, trusting, in contempt or fear
Of vital principle's controlling law,
To her purblind guide Expediency; and so
Suffers religious faith. Elate with view
Of what is won, we overlook or scorn
The best that should keep pace with it, and must,
Else more and more the general mind will droop,
Even as if bent on perishing. There lives
No faculty within us which the Soul
Can spare, and humblest earthly Weal demands,
For dignity not placed beyond her reach,
Zealous co-operation of all means
Given or acquired, to raise us from the mire,
And liberate our hearts from low pursuits.
By gross Utilities enslaved, we need
More of ennobling impulse from the past,
If to the future aught of good must come
Sounder, and therefore holier, than the ends
Which, in the giddiness of self-applause,
We covet as supreme. Oh, grant the crown
That Wisdom wears, or take his treacherous staff
From Knowledge!—If the Muse, whom I have served
This day, be mistress of a single pearl
Fit to be placed in that pure diadem,
Then, not in vain, under these chestnut boughs
Reclined, shall I have yielded up my soul
To transports from the secondary founts
Flowing of time and place, and paid to both
Due homage; nor shall fruitlessly have striven,
By love of beauty moved, to enshrine in verse
Accordant meditations, which in times
Vex'd and disorder'd, as our own, may shed
Influence, at least among a scatter'd few,
To soberness of mind and peace of heart
Friendly; as here to my repose hath been
This flowering broom's dear neighbourhood, the light
And murmur issuing from yon pendent flood,
And all the varied landscape. Let us now
Rise, and to-morrow greet magnificent Rome."

The following upon the flower called *Love lies Bleeding*, seems to us exquisite:—

"You call it, 'Love lies Bleeding'—so you may,
Though the red flower, not prostrate, only droops,
As we have seen it here from day to day,
From month to month, life passing not away:
A flower how rich in sadness! Even thus stoops
(Sentient by Grecian sculptor's marvellous power),
Thus leans, with hanging brow and body bent
Earthward in uncomplaining languishment,
The dying Gladiator. So, sad flower!
('Tis Fancy guides me, willing to be led,
Though by a slender thread,)
So droop'd Adonis, bathed in sanguine dew
Of his death-wound, when he from innocent air
The gentlest breath of resignation drew;
While Venus, in a passion of despair,
Rent, weeping over him, her golden hair,
Spangled with drops of that celestial shower.
She suffer'd, as immortals sometimes do;
But pangs more lasting far *that* lover knew
Who first, weigh'd down by scorn, in some lone bower
Did press this semblance of unpitied smart
Into the service of his constant heart;
His own dejection, downcast flower! could share
With thine, and gave the mournful name which thou wilt ever bear."

The following lines to a Redbreast, written during sickness, are said to be from the pen of a female relative, and remind us of the simple and touching style of the poet:—

"Stay, little cheerful robin! stay,
And at my casement sing,
Though it should prove a farewell lay,
And this our parting spring.
Though I, alas! may ne'er enjoy
The promise in thy song;
A charm *that* thought cannot destroy,
Doth to thy strain belong.
Methinks that in my dying hour
Thy song would still be dear,
And with a more than earthly power
My passing spirit cheer.
Then, little bird, this boon confer:
Come, and my requiem sing;
Nor fail to be the harbinger
Of everlasting spring."

As for the tragedy of the *Borderers*, it will probably add little to the author's reputation. Though containing fine thoughts scattered here and there, it is unfitted for exhibition on the stage, and indeed, as the author admits, was never intended for production in public.

THE EARLY DAYS OF NAPOLEON.

THERE hangs over the boyish days of Napoleon Bonaparte a mystery somewhat similar to that which rests on the opening years of Shakspeare. In the case of the latter, we are totally at a loss to comprehend by what species of training that wonderful mind was developed, and whence was derived that boundless knowledge of human nature, and of the phenomena of the universe, which his writings display. With the like feelings of uncertainty do we muse upon the early life of Napoleon, wondering in what manner that prodigious amount of intelligence was accumulated, which gave him such a sway in after-days over his fellow-men, and rendered him never for one instant at a loss, amid the most varied and trying circumstances in which man could be called upon to act. Bonaparte appeared to burst at once upon the world with the experience of fifty lives concentrated in his young mind, ready to take up at will the parts of warrior, ruler, legislator, or diplomatist, and to cope with and foil those who had grown grey in studying the duties of but one or other of these difficult characters. These circumstances throw a peculiar interest over the youth of Napoleon. Fortunately, during the period of the consulate, he gave directions for the preservation of various letters and papers connected with his early history, and from a notice of these, lately published in France,* we shall proceed to draw several particulars.

Paoli, the Corsican patriot, seems to have been a material instrument in moulding the character of the young Napoleon. Genoa had assumed the right of selling Corsica to France, in the time of Louis XV., and that monarch sent an army to take possession of it. The Corsicans resisted, under the guidance of Paoli. Charles Bonaparte was a warm partisan of that chief; and, in the campaign of 1769, which gave France the ascendancy, was personally in the field with his wife Letitia, who, at that very time, in the midst of peril and alarm, gave birth to Napoleon. During the childhood of the latter, Paoli was constantly in the mouths of those around him, and he grew up with a deep admiration of the character of the exiled general, then living in England. When the French Revolution broke out, Paoli was recalled, and Napoleon became his close personal friend. The old general had penetration enough to discern the remarkable character of the youth. "You are one of Plutarch's men," he used to say to him—a compliment of no slight kind. It has been often asserted, that Napoleon never acted under the impulse of feeling, but was always guided by motives of self-interest and cold calculation. Not so was it when Paoli, having incurred the suspicion of the French Convention for his denunciations of the execution of Louis XVI., was summoned to appear and answer for himself in Paris. Napoleon, who had then received a commission in the French service in Corsica, had the generous boldness to write to the Convention in his old friend's defence. "One of your decrees," says the letter, "has deeply afflicted the citizens of Ajaccio; it is that which orders an old man of seventy, loaded with infirmities, to drag himself to your bar, charged, through misunderstanding, as corrupt and ambitious. Representatives! when the French were governed by a corrupt court, and placed credence neither in virtue nor patriotism, then might it have been said, perhaps, that Paoli was ambitious. It is by despots alone that Paoli should now be deemed ambitious; at Paris, in the midst of French liberty, he ought to be regarded as the patriarch of freedom, the precursor of your republic; so will posterity think, and so do the people now believe. We owe to him all, even the happiness of being a portion of the French republic. He ever enjoys our confidence. Repeal your decree, and render us happy." Napoleon's bold appeal was not listened to, and Paoli was compelled to look for safety to England.

Another person who exercised much influence over Napoleon in his youth, was Father Dupuy, sub-principal of the school of Brienne. As became common in the case of Corsican families of respectability, after the island was incorporated with France, Napoleon was sent to the college of Autun at the age of nine, and afterwards to the school of Brienne. Bourrienne mentions, in his memoirs of Bonaparte, that the Emperor never could spell properly; but he does not tell the reason. The fact was, that Napoleon could not speak a word of French when he came to the school first mentioned. He picked up the tongue through his intercourse with others, but never was taught it grammatically. He was engaged in learning the classics, when he ought to have been set to the French language by his teachers. His excessively careless penmanship in later days was supposed to be partly affected, in order to hide his faulty orthography. Dupuy, who formed a strong attachment to Napoleon, and was shown the essays from his pen, did all he could to correct the style and spelling, but the evil was not thoroughly removable. One of the early essays of Napoleon was a History of Corsica, which was composed in the form of letters, addressed to the Abbé Raynal. Lucien Bonaparte mentions this work in his memoirs. "It was written," he says, "in the vacation of 1790, at Ajaccio, and two copies were made of it by myself. One was sent to the Abbé Raynal, who found the composition so remarkable that he showed it to Mirabeau. The latter, on returning it, said to Raynal, that this little history seemed to him to indicate a genius of the first order. Napoleon was delighted with these praises." The work was represented by Lucien as lost, but in reality it is still in existence, having formed part of a bundle of early writings lodged by Napoleon in the hands of Cardinal Fesch. It is written with great vigour, and an uncompromising boldness of speech. Every page proves, moreover, that the author had been indefatigable in his researches into authorities, and even unpublished documents. Napoleon's mode of reading books was peculiar, and well calculated to fix on his memory whatever fell under his eye. His custom was to read with the pen in his hand, and to mark passages which he approved or disapproved; and frequently, when he was especially struck with any thing, he made it the subject of a distinct critical disquisition. In this manner did he go over all the most grave and learned works in the stores of literature. Herodotus, Strabo, Plutarch, and all the other historians both of Greece and Rome; the annals of England, and all the most important modern countries in the world; natural history, geography, medicine, and physics; all of these branches of learning his papers show him to have studied attentively. But, above all, his favourite authors were Filangieri, Mably, Necker, Smith, and other writers on political economy, legislation, and the moral sciences generally. For seven years, namely, from 1786 to 1793, while a student and lieutenant of artillery, now in one place and now in another, such was the training to which his papers show him to have subjected himself. Men have marvelled that the soldier of Italy should have started up, as it seemed, a legislator by intuition,—*intuition*; such is the word under which men too frequently shelter their own apathy and deficiencies. *Years of patient study*, while other lads were fooling away their time, would, at least in this instance, have been a more correct form of expression. Napoleon's ability as a soldier was not less puzzling; but comprehensiveness and promptitude of thought, produced by the same preparatory studies, united with a sound physical development, formed the true explanation of the phenomenon. What is curious, however, Bonaparte sometimes left his grave studies for the slightest of all varieties of literary composition: he wrote *novels*. One of these was an English romance, entitled *The Earl of Essex*, being founded on the story of Queen Elizabeth's unfortunate favourite. Another tale was composed by him on a Corsican subject, and he also wrote some oriental apologues, bearing covertly on the politics of the passing day. The idea of the man who wielded such mighty elements in after days, devoting time to story-writing, is startling enough. It has the same apparent incongruity as the idea of his being glad to borrow a few shillings from Bourrienne in the days of his lieutenantship.

We cannot well give a specimen of the stories of Napoleon, but our space permits of our quoting one of the most remarkable of all his papers in place of these. This is a document in which he discusses the propriety of *suicide*. Many features of his future character seem to have originated in youth in his isolated position. From the age of nine to seventeen, he was absent from home. He dwelt alone, and formed those habits of self-dependence which at once constituted a great quality in him, and isolated him, in a measure, from human sympathies. His note-book was the sole confidant of his secrets in his youth. Whatever struck him forcibly, even a simple conversation with a lady, was committed to paper, and, beyond question, this plan led him ever to reason coolly

* In the *Revue des Deux Mondes*.

before action. The following are his thoughts on the subject of self-destruction. "Ever alone in the midst of men, I return to dream with myself, and to give myself up to all the vivacity of my melancholy. To what point is it now directed? To the side of death. Yet in the morning of my days, I may hope to live a long time. I have been absent seven years from my country. What pleasure shall I not taste in revisiting, in four months, my relatives and compatriots? Filled with the tender sensations which the remembrance of my youthful pleasures inspires, may I not conclude that my happiness will be complete? And what madness, then, urges me to wish for my destruction? Doubtless, I may say, what have I to do in this world? Since I must die, is it not as well to end my life at once? If I had passed through sixty years, I should respect the prejudices of my contemporaries, and wait patiently till nature had completed her course; but since I begin to experience misfortunes, since nothing gives me pleasure, why should I go on enduring unprosperous days? How far have men wandered from nature! How cowardly, base, and servile are they! What spectacle shall I behold in my native country? My compatriots, loaded with chains, tremblingly kiss the hand which crushes them. They are no more those brave Corsicans, whom a hero animated with his virtues; no more are they enemies of tyranny, luxury, sycophancy. Proud, and full of a noble consciousness of worth, a Corsican once lived happy. If he had employed the day on public affairs, his evenings passed away in the sweet society of a loving and beloved spouse; reason and enthusiasm effaced all the fatigues of the day; tender and natural affection rendered his nights comparable to those of the gods. But these happy times have disappeared with liberty, like passing dreams! Frenchmen, not content with having reft from us all that we cherished, ye have also corrupted our manners! The existing spectacle of my country, and my powerlessness to effect a change, form a new reason for quitting a scene, where I am compelled by duty to praise men whom virtue commands me to hate. When I arrive at my home, what aspect shall I assume, what language shall I hold? His country lost, a good citizen ought to die. Had I but one man to destroy, in order to deliver my countrymen, I should turn to the task in one instant, and avenge my country and its violated laws by plunging my steel into the tyrant's bosom. Life is a burden to me, because I enjoy no pleasure, and because all is pain to me; it is a burden because the men with whom I live, and probably shall always live, have manners as widely different from mine as the moon's light differs from that of the sun. I cannot follow the sole mode of life which could make it endurable, and a disgust for all is the consequence."

This passage affords a remarkable proof of the high-reaching sentiments which, even at the age of seventeen, characterised Napoleon. The death which he meditates is the death of Cato, not of Chatterton. It is not the pressure of penury which disgusts the extraordinary boy with life, but the slavery of his country and the degradation of his species. There is ample evidence existing among his early papers to prove, that he was in his youth a genuine and ardent lover of republican liberty, and that he disliked the French, fixing his whole thoughts on Corsica. As his mind became matured, however, he saw that Corsica was too insignificant in extent, and possessed resources too limited, to permit it to flourish independently amid states so much superior to it in power; and he turned to France, as affording full scope for the development of those great problems in social government which occupied so much of his youthful attention.

Among the thirty-eight bundles of papers consigned by Napoleon to Cardinal Fesch, one curious paper deserves to be briefly referred to. It is a *Dialogue on Love*, which proves how early his opinions had been formed on this, as on other points. He never was remarkable for *sentiment*, and, at the commencement of his dialogue, he speaks in this condemnatory manner of the feeling of affection between the sexes. "I believe it to be hurtful to society, and to the individual happiness of men; I believe, at least, that it does more harm than good, and that a benefit would be conferred by that protecting power which should extinguish it, and deliver men from its influence." Notwithstanding this denunciation, he was beyond question devotedly attached in his life to at least one woman—Josephine. His letters to her from Italy carry passion even to extravagance.

The writer in the *Revue des Deux Mondes*, from whom we derive these notices of Napoleon's early days, concludes by observing, that "every thing proves him to have exemplified, like other men of genius, that law of humanity which ordains that nothing great can be accomplished without great efforts. In spite of his superior talents, he had studied long and carefully those subjects in which he afterwards showed himself a master. During many years, he never ceased to read and reflect on the most profound existing works. If he displayed ideas so correct on legislation, finance, and social organisation, these ideas did not spring spontaneously from his brain. On the throne, he only reaped the fruits of the long labours of the poor lieutenant of artillery. He formed his character by the means suited for the development of superior men—by toil, solitude, meditation, and endurance. The Revolution offered to him a vast and brilliant field; but without that revolution, he would still have been distinguished, for characters like his seize on fortune, and make it serve them. Let it be no more said that chance elevated Napoleon. When, after seven years of retirement, he appeared for the first time on the stage of the world, he contained already all the germs of his future greatness. Nothing was fortuitous in his case. He struggled to rise, and left no occasion unused to make himself known. He himself, therefore, must no more be permitted to ascribe his elevation to fatality."

To these truths nothing can be added. Never was it more fully shown than in the case of Napoleon—that *industry is the better part of genius.*

OSIER-WEAVING.

BASKET-MAKING or osier-weaving is an art which seems to us to have a tendency, somehow or another, to call up pleasant reflections whenever the mind is directed to it. The cause of this perhaps is, that the art is a peculiarly neat and cleanly one; and partly, perhaps, because it affords occupation to so many of our poor fellow-creatures who have scarcely any other resource to turn to for bread—the infirm, the lame, and the blind. Possibly, moreover, the beautiful story of the Peruvian Basket-Maker, told in almost all reading-books for the young, may have an early influence in impressing the mind with a pleasing sense of the usefulness of this little art. Speaking for ourselves, all three causes, we believe, have had their effect; and if others have felt any similar impressions, some account of the basket-weaving process may not be unacceptable.

The interweaving of twigs is an operation which suggests itself so naturally to man, that we cannot wonder at finding it practised by him in his rudest condition. The very birds teach it to him, for among them we have some clever twig-weavers. Plaiting of rushes comes more readily to the hands of boys than almost any other manual task, and the very simplest of all baskets are actually formed of this material. Some of the Van Diemen's Land tribes make (or rather *did* make, for the last native of that island was hanged lately) baskets of strong rushes by tying the ends merely, and keeping the middle parts swelled out by a cross band or two. These tribes stood very low in the scale of civilisation. Some other Australasians, a little more civilised, have been observed to make baskets of leaves so dexterously intertwined as to hold liquids without spilling. Of all the rude nations, in truth, with whom we have become acquainted, not one is ignorant of this art; and there is every reason to conclude that past times were in this respect like the present. Our own ancestors,

> "While yet our England was a wolfish den,"

were famous for their skill in basket-making, as Martial tells us that their manufactures were brought to Rome in great quantities, and, like our oysters, sold there for extravagant prices.

In days and places where nailing, dove-tailing, jointing, and hingeing were arts unknown, plaiting was the most natural of all resources and substitutes. Hence not only utensils such as baskets, but houses or huts, scallops, shields, and sword-hilts, and the like articles, were all formed from the same material, being rendered serviceable by coverings of hides, another ready resort in rude regions. At the present day, in some parts of the east, half the necessary implements of life are made of wicker-work, the bamboo, from its strength and elasticity, giving peculiar facilities for such manufactures. Boats of hide and bamboo can be made by half-a-dozen men in as many hours, when it is necessary to cross a river; and these articles can be constructed of such strength, that thirty men, and even cattle, can be transported in them from bank to bank.

To attend, however, to basket-making in particular. Osiers or willows are the usual materials employed in this manufacture. The wands are cut by the roots, and if intended for the finer kinds of work, are soaked for a time in water previously to their being peeled. This is done by means of a brake or iron instrument, through which they are drawn. As the natural sap of the wands greatly injures the work, they are always dried in the sun, whether peeled or unpeeled, before use. One of the circumstances that renders osier-work a ready resource to persons incapacitated from engaging in other work, is the very small number of implements required for the craft. A brake, such as has been mentioned, a knife or two, and a splitter, consisting of two edge-tools placed at right angles, for cleaving the wood longitudinally into one or more splits, are all or nearly all the tools required. The workman arranges his wands into bundles according to their strength, the largest being set apart by him for the rims and binding-rods of the basket. When the artificer begins to an ordinary flat-bottomed basket, his first operation is to form the *slat*, as it is called, or woof, out of which the osier web is to be formed. He lays down a number of wands, cut each of a little greater length than is required, and arranges them at a short distance from one another, and in a parallel position. These wands are then crossed at right angles by two rods, each of which passes alternately above and below the parallel wands, thus keeping them in their places. The cross rods are chosen of great length, and their loose ends are turned and woven under and over the pairs of short ends all round the bottom, until the whole be woven in. The same thing is done with the other rod, and then additional long rods are woven in in a similar way, until the whole bottom be occupied with them. To form the sides, a number of upright rods with sharpened points are forced between the rods of the bottom, or are plaited with them towards the centre. Around these perpendicular ribs other rods are woven in and out alternately, until the sides also are complete. The rim of the basket is chiefly formed by turning down the ends of the upright rods, and plaiting them over one another. Sharp-pointed wands are forced down through the rim, and pinned on each side to form the handle. They are usually plaited together more or less intricately.

It would be a waste of time to describe the mode of making rounded baskets, their construction being so visibly simple. Both the cross ribs and the longitudinal wands pass usually from rim to rim, and are there turned over a strong encircling wand, and fixed by a few plaitings afterwards. Considering the great simplicity of construction of the common willow baskets, and their usefulness in many respects, it strikes us that our peasantry are by no means so thrifty and careful as they might be in respect to these matters. We have no ill-will whatever to tinkers and gipsies, and admit that no very large sums are requisite to purchase brown baskets for the necessities of a farmer's or cottar's establishment; yet the old maxims are good ones, which recommend people never to look to others for a service which they can do for themselves, and to take care of the small sums, as the large ones will then look after themselves. Therefore, seeing that clumps of willows are nowhere very scarce over old Scotland, we imagine that the long nights might often be spent by the rustic ingle in making the handy articles under notice with greater advantage than in gossipry. The little story of the Peruvian Basket-Maker, which, though an invention, conveys a moral of daily applicability, might teach parents that a species of useful knowledge, despised under certain circumstances, might in others become of paramount importance. In the tale mentioned, we are told that a proud gentleman scorned a poor basket-maker as of an inferior species, when a king, from whom both of them stood at so great a distance as to seem equal, took it into his head to send them away together to a savage island, and to leave them there in nudity, that the assumed natural superiority of the one might have scope for display if it existed. The luxuriously-nurtured gentleman was plunged in misery by his exposure, and would have perished but for his contemned companion. Savages discovered them; the gentleman could neither defend himself nor do aught for his life. But the basket-maker had a resource. Making signs for the savages to wait, he set to work on some rushes, and in a few minutes plaited a cap for one of the chiefs, who donned it with rapture. Others were called for instantly, and, in brief, the basket-maker became the delight of the tribe. At his intreaty the gentleman's life was spared; but seeing him to be of no use, the savages despised him utterly. Here was a lesson given to him. The poor man was far above him in the eyes of those who were not blinded by artificial distinctions; and the petty art which he had despised was the means of saving his life. So runs the moral, and, as observed, it is in part applicable every hour of the day. We do not know to what we may come in this world of changes, casualties, and sufferings; and the pettiest accession of really useful knowledge ought not to be contemned by us.

This is a digression, but not without a purpose. The art of basket-working has been neglected in Britain, but especially in Scotland; so much so, that a patriotic society for the improvement of arts and sciences some time ago offered premiums for the cultivation of the best kinds of materials for the craft of basket-making. Mr Phillips, of Ely, was consequently induced to make some experiments, by which he gained the reward. He found that there were about fourteen or fifteen varieties of the osier-willow; and that but a few of them were well fitted for basket-making. The grey or brindled osier, the bark of which is marked by red streaks, is hardy, tough, and bleaches well, but it is rare in Britain. The other principal species are the Welsh willow, of which there are two kinds, one red and the other white; the Spanish willow; the new willow; the Kent willow; and the French willow. The latter is held the best, particularly for light purposes. It is grown in Britain to a considerable extent, yet large quantities have annually to be imported from the continent.

Unquestionably, this might be remedied. The willow, in all its forms, grows well in the British climate, and indeed better there, perhaps, than in more southerly climes; so that there appears no good reason why an ample supply should not be obtained at home for the home market. Unfortunately, however, in agricultural matters above all others we seem to cling with tenacity to old forms and customs. To introduce a new seed, or improved article of any kind for culture, though its merits may be fully proven, is one of the most difficult things imaginable; and every body remembers how ludicrously the same anti-innovating spirit was exhibited in the matter of barn-fanners, which the old rustics denounced as demoniacal and heretical in the extreme. Some such feelings seem to have caused the agricultural population to neglect the call made by the society for the improvement of arts and manufactures some years ago. People still persist in the hopeless attempt to grow corn and wheat out of undrainable land, though crops of willows, which require a humid soil, and are in constant request

in the market, might save them all their draining outlay, and remunerate them much better on the whole. Mr Phillips calculated that good and well-managed willows would give, in ordinary circumstances, an annual profit of above L.18 an acre. Others state the profit lower, or about L.10 or L.12 per acre. Any of these sums, considering the nature of the soil occupied, might well induce people to try the culture of osiers.

Mr Phillips conceives the best time for planting to be autumn, and the best time for cutting to be also autumn, though it is common to plant in the spring. Shoots only are cut, and the stock left. From 6000 to 12,000 sets are usually planted on an acre of ground. It has just been mentioned that humidity is necessary for willows. They grow even in standing water, but are too soft in such situations, and not well fitted for basket-work.

Upon the whole, it might be worth while for agricultural people to look into this matter, and see if they could not do both themselves and their country good by giving the home market a home supply of an article continually in demand, and for which foreign countries have to be resorted to at present.

MEMORY.

In a paper read a short time ago by Sir Henry Marsh, Bart., at a meeting of physicians, on the subject of memory, and which afterwards appeared in a newspaper, we find the following intelligent observations, tending to show that memory, like every thing else, is susceptible of cultivation, and must always less or more depend on the proper exercise of the faculties of the mind:—

"Wherever there are traces of mental manifestation, there the attribute of memory is to be found—variously distributed, but always bearing invariable proportion to the amount and extent of intellectual development. As the instincts of the animal become more numerous, so the reach of memory increases; and if, in our observations of facts, beginning with the lowest, we ascend in the scale of animated nature, we shall discover a gradual augmentation of mind and memory till we arrive at man, who, in the possession of both, stands alone and pre-eminent above every other inhabitant of the earth. It is on the score of those superior faculties, moral and intellectual, by which man is distinguished, that he, amongst animals, is designated the image of his Maker; but how valueless had all these endowments been, had not that of memory been superadded! Of all the mental powers, none arrests so forcibly the attention of all classes of persons as this of which we treat. Its utility in every sphere and condition of life is so palpable, that it cannot pass unobserved. It is also so remarkably affected by disease, so strikingly exhibited in infancy and childhood, so altered in character by old age, and displayed in such strong features, though limited in extent, in the warring and predatory life of savage and uncivilised man, and so largely bestowed in some one distinct form upon particular individuals, that it is, above all other mental manifestations, that which never fails to obtrude itself upon the notice of even the unobservant and thoughtless.

The events and occurrences of childhood are not imprinted permanently on the mind. In all instances in which I have made inquiry, I cannot trace permanent impressions farther back than to about two years and a half old. A lady told me lately, that she left India when only three years old—that she distinctly recollected having been carried in a palanquin, and having embarked on board what then appeared to her an enormous vessel, in which she sailed to Europe; all else had escaped from her memory. The first event of my own life which I can recollect is a fight with a cock. From that period onwards to the age of eight years, the facts and events which I am able to recall are few. In precocious children it may be different; but of these so many die prematurely, that we cannot gather many facts. In old age, too, memory gradually fails. We may say, then, that the period of memory is the period of the consciousness of personal identity. In point of fact, we live only as long as we can recall past impressions; all else in life, both in infancy and extreme senility, and the time spent in sleep, is a blank. Thus the period of human life is contracted within a smaller span than the number of years usually reckoned upon. The progress of memory from infancy to mature years in an individual of an energetic, active, and cultivated mind, may not inaptly be compared with some great river—at its source a streamlet, enlarging by degrees as it advances, collecting materials for expansion from a thousand springs, spreading wider and wider as it rolls onwards, and becoming ultimately one mighty and majestic mass of waters—deep, broad, and beautiful—till at length it is mingled with and lost in the ocean. Such is the progress of memory in the human mind. Memory cannot be without a previous impression. An impression cannot be made upon the mind without *attention*. Attention presents itself to our view under two very distinct forms; one, instinctive and necessary, which takes place whether we will or not; the other constrained, or the result of mental effort. So likewise memory, or the recalling of past impressions, is either necessary and spontaneous, or it is the result of a mental effort. The first is termed simple memory; the second, recollection. The more vigorous and active each mental faculty, the more excited is the attention to congenial objects, the more forcible the impression made, and consequently the more tenacious and permanent the memory of such impressions. The order of the sequence then is—active faculties, strong impressions, vigorous memory.

I have often thought that, if in children the various powers of memory were closely observed, an index of the mental faculties would thence be derived, most valuable in the conduct of education. Believing, as I do, that many intellectual faculties have each its own proper memory, it follows, as a necessary consequence, that in proportion to the strength and activity of each faculty is the vigour, readiness, and retentiveness of the memory attached to it. Hence, by carefully studying the memory, and ascertaining by well-conducted experiment where it is vigorous and retentive, and where comparatively defective, we should be materially assisted in arriving at a knowledge of the real condition of the mental faculties of the individual whom we undertake to educate.

In this our sublunary state of existence, mind and matter are so inseparably united, that the one cannot manifest its functions without the other. The brain is the material instrument of the mind. The human brain, in number and depth of convolutions, in the proportionate quantity of grey or cineritious matter, in size, compared with the other portions of the nervous system, in development of parts posteriorly, superiorly, and anteriorly, exceeds that of all other animals. If the brain be deranged in function, or diseased in structure, the memorial faculties suffer. The brain sympathises with remote parts, and with the digestive organs in particular; we all know and feel to what an extent our reasoning powers and memory are influenced by the state of the stomach. Often in my boyhood, and even subsequently, I have endeavoured to repeat at night words or propositions which I was anxious to imprint on the memory, and repeat correctly. At night I could perform my task but very imperfectly; on awaking in the morning, and repeating the effort, not one word was forgotten. Sympathy with remote parts—high mental excitements and emotions, such as grief, intense pleasure, intense application—various poisonous substances, such as opium, alcohol, disease, injury—all these, by disturbing the functions of the brain, derange variously, and to a greater or less extent, the mental manifestations."

We add the single observation, that young persons who feel deficient in memory, may rest assured that the defect is caused less by inferior mental capacity, than want of application at right times and on right objects. The avoidance of trifling pursuits and undue gratifications of the senses, at the same time directing the mind to subjects of a useful and ennobling tendency, will strengthen the reflective faculties, and *that* is the cultivation of the memory.

EXTREME OLD AGE.

We pray in the Litany to be delivered from sudden death. Any death is to be deprecated which should find us unprepared; but, as a temporal calamity, with more reason might we pray to be spared from the misery of an infirm old age. It was once my fortune to see a frightful instance of extreme longevity—a woman who was nearly in her hundredth year. Her sight was greatly decayed, though not lost; it was very difficult to make her hear, and not easy then to make her understand what was said, though, when her torpid intellect was awakened, she was legally of sane mind. She was unable to walk, or to assist herself in any way. Her neck hung in such wrinkles, that it might almost be likened to a turkey's; and the skin of her face and of her arms was cleft like the bark of an oak, as rough, and almost of as dark a colour. In this condition, without any apparent suffering, she passed her time in a state between sleeping and waking, fortunate that she could thus beguile the wearisomeness of such an existence. Instances of this kind are much rarer in Europe than in tropical climates. Negresses in the West Indies sometimes attain an age which is seldom ascertained, because it is far beyond living memory. They outlive all voluntary power, and their descendants of the third or fourth generation carry them out of their cabins into the open air, and lay them, like logs, as the season may require, in the sunshine or in the shade. Methinks, if Mæcenas had seen such an object, he would have composed a palinode to those verses in which he has perpetuated his most pitiable love for life. A woman in New Hampshire, North America, had reached the miserable age of 102, when, one day, as some people were visiting her, the bell tolled for a funeral; she burst into tears, and said, "Oh, when will the bell toll for me! It seems as if it never would toll for me! I am afraid that I shall never die!" This reminds me that I have either read or heard an affecting story of a poor old woman in England—very old, and very poor—who retained her senses long after the body had become a weary burden; she, too, when she heard the bell toll for a funeral, used to weep, and say she was afraid God had forgotten her! These are extreme cases, as rare as they are mournful. Life, indeed, is long enough for what we have to suffer, as well as what we have to learn; but it was wisely said by an old Scottish minister (I wish I knew his name, for this saying ought to have immortalised it), "Time is short; and if your cross is heavy, you have not far to carry it."—*The Doctor.*

[The writer of the above omits one of the chief reasons for not wishing to live to an extreme old age—the total deprivation of all friends and relatives whom we knew in youth or later years. The gradual loss of these, as we become older, is a kind provision for weaning us from a love of an undue length of life.]

EFFECTS OF FOOD ON THE FORM AND CHARACTER OF QUADRUPEDS.

Food influences all the external characters of quadrupeds. Without adverting to the different appearance of an ill-fed beast and one which has an abundant supply, we may remark, that the form of the young animal that suffers a deprivation either in the quantity or quality of its food, never becomes perfectly developed either in its bulk or proportions. The integuments of such a one never present the gloss of health, neither is the constitution at large often free from disease; internal congestions take place, and the mesenteric glands frequently become schirrous. On the contrary, in proportion as the supply within prudent limits is liberal, so is the growth extended, and the form reaches to the standard of the parent. It often also exceeds the parent stock, from the excess of nutritive stimulus applied; and thus horses, oxen, and sheep, brought up in low marshy lands, where the herbage is luxuriant, attain a monstrous size. Horses, in particular, when bred and pastured in the rich flat lands of Lincolnshire, become expanded in bulk, and it is from such sources that our carriage and heavy troop horses are supplied. To what a degree of monstrosity may not our bacon hogs be fed; and our prize-oxen exhibit the extraordinary powers of food, when forced on an animal, by increasing the supply and restraining the expenditure. It is from our artificial mode of feeding cattle that our markets are now furnished with veal all the year round, and lamb is so common some months before it appeared at the tables of our forefathers.—*Encyclopædia of Rural Sports.*

ENGLISH AND IRISH BEGGARS.

You may journey many a mile in England, and the people you will meet are in their manner and deportment so much alike, that they appear, if not members of one family, to have been all educated in the same school. It is otherwise in Ireland; everywhere there is some national characteristic, the ramifications of which are various and numerous. The English pauper is at once bowed down by misery, and murmurs and complains under its endurance from first to last. The Irish beggar wrestles with distress; he can exist upon so little food as to seem almost able to live without it; but he cannot do without his jest; there are moments when the heart beats lightly even in his starving bosom. The poverty of the English, except at stated times, is sullen; the poverty of the Irish is garrulous: the Englishman takes relief as a right; the Irishman accepts it as a boon. You may aid half a dozen English paupers without receiving thanks; you cannot relieve an Irish beggar without being paid in blessings.—*Hall's Ireland.*

DEACONS OF THE OLD SCHOOL.

In the days of Bailie Nicol Jarvie's father, the office of deacon [chairman of a corporation of tradesmen] was esteemed no mean distinction. Two worthy incumbents, who fretted their little hour upon a stage not far from the banks of the Ayr, happened to be invested with the above-named dignity on the same day. The more youthful of the two flew home to tell his young wife what an important prop of the civic edifice he had been allowed to become; and searching the "but and ben" in vain, ran out to the byre, where, meeting the cow, he could no longer contain his joy, but, in the fullness of his heart, clasped her round the neck, and it is even said, kissed her, exclaiming, "Oh, crummie, crummie, ye're nae langer a common cow—ye're *the deacon's cow!*" The elder civic dignitary was a sedate pious person, and felt rather "blate" in showing to his wife that he was uplifted above this world's honours. As he thought, however, it was too good a piece of news to allow her to remain any time ignorant of, he lifted the latch of his own door, and stretching his head inwards, "Nelly!" said he, in a voice that made Nelly all ears and eyes, "gif ony body comes spierin' for *the deacon*, I'm just owre the gate at John Tamson's!"—*Ayr Advertiser.*

WHAT IS A GENTLEMAN?

By the appellation of a gentleman, it is not meant to draw a line that would be invidious between high and low, rank and subordination, riches and poverty. The distinction is in the mind. Whoever is open, loyal, and true—whoever is of humane and affable demeanour—whoever is honourable in himself, and in his judgment of others, and requires no law but his word to make him fulfil an engagement, such a man is a gentleman, and such a man may be found among the tillers of the earth. High birth and distinction, however, for the most part, ensure the high sentiment which is denied to poverty and lower professions. It is hence, and hence only, that the great claim their superiority; and hence what has been so beautifully said of honour, the law of kings, is no more than true. It aids and strengthens virtue where it meets her, and imitates her actions where she is not.—*Book of Thought.*

MAKING A MYSTERY OF NOTHING.

There are minds so habituated to intrigue and mystery in themselves, and so prone to expect it from others, that they will never accept of a plain reason for a plain fact, if it be possible to devise causes for it that are obscure, far-fetched, and usually *not worth the carriage*. Like the miser of Berkshire, who would ruin a good horse to escape a turnpike, so these gentlemen ride their high-bred theories to death, in order to come at truth, through byepaths, lanes, and alleys; while she herself is jogging quietly along upon the high and beaten road of common sense. The consequence is, that those who take this mode of arriving at truth, are sometimes *before* her, and sometimes *behind* her, but very seldom *with* her. Thus, the great statesman who relates the conspiracy against Doria, pauses to deliberate upon, and minutely to scrutinise into divers and sundry errors committed, and opportunities neglected, whereby he would wish to account for the total failure of that spirited enterprise. But the plain fact was, that the scheme had been so well planned and digested, that it was victorious in every point of its operation, both on the sea and on the shore, in the harbour of Genoa no less than in the city, until that most unlucky accident befell the Count de Fiesque, who was the very life and soul of the conspiracy. In stepping from one galley to another, the plank on which he stood upset, and he fell into the sea. His armour happened to be very *heavy*, the night to be very *dark*, the water to be very *deep*, and the bottom to be very *muddy*. And it is another plain fact, that water, in all such cases, happens to make no distinction whatever between a *conqueror* and a *cat*. —*Lacon.*

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row.

Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

THOUGHTS ON NATIONS AND CIVILISATION.

SOME philosophers have such an opinion of the helplessness of the race to which they belong, as to be quite at a loss to understand how civilisation should have commenced. They see vast nations of barbarians still overspreading the earth, amongst whom, after thousands of years, no tendency to improvement can be detected; and, not perceiving any natural differences in men, they wonder how the history of other nations, originally as barbarous, should have been so different. Their error lies, first, in not seeing differences in men. There are great organic differences both in nations and in individuals, accompanied by corresponding differences of mental character. It may be readily owned that, as far as we can see, no power of originating a spontaneous civilisation exists in the Papuans and the Troglodytes; *these*, apparently, must wait for a reflected light from other quarters. But the Hellenes and the Teutones, and some other races, have been constituted very differently. The error of the philosophers lies, secondly, in their not understanding that the mental faculties have an inherent activity, and that, in some special cases of high endowment, this activity is inventive and suggestive, thus striking out new lights from the mass of surrounding darkness. A Pascal, at fifteen, made out for himself the chief conclusions of geometry. A woolcomber's son, springing up amongst the commonalty of Warwickshire, wrote more exquisite things, untaught, than any educated man of his own or almost any other age. Why should it be so difficult to comprehend how savage man first learned to kindle a fire or cook his food? Truly, the ideas of philosophers respecting their race are any thing but complimentary. We say, on the contrary, that, just as we see geniuses rise every day to extend the bounds of knowledge, and singularly worthy men to advance and exemplify moral excellence, so, in a barbarian community of the superior kind, would there be better men rising every now and then, to produce some improvement in both respects. The law which produces such men must have operated from the beginning: as there were many heroes before Agamemnon, so there must have been many Anaxagorases, Aristotles, and Platoes, long before the philosophers of these names existed—men capable of conceiving and showing the way to something superior to barbarism. These were the fathers of civilisation. The mythologies of most nations seem to be an obscure record of such men, Veneration having deified them, while as yet Intellect had not formed a written language in which to take down a correct account of their deservings.

It is scarcely necessary to remark, that, upon this theory, the civilisation and arts of Central America are to be accounted for without puzzling ourselves about the source of American population. A better kind of race seems to have arisen in that part of the American continent: there is no reason why that race should not have invented architectural designs and practised sculpture *out of their own heads*, as well as the Egyptians, from whom it is vainly attempted to be shown that they must have borrowed their ideas. The invention of these, and a thousand other things, was but a natural phenomenon, only requiring the conditions of intellect and certain external circumstances to bring it to pass. It might take place in any of those physically favoured regions of the earth, where alone young nations are sufficiently at ease on the score of food and shelter to allow of their cultivating the arts of civilisation. And it is important to remark, that the Toltecan civilisation might have an independent beginning, whether the people came originally from the eastern continent or not.

Assuming one origin for the whole race, it is much less difficult than might be supposed to show how the variations have since arisen. That external physical circumstances will do much to produce variation—to blacken or whiten the skin, for instance—can scarcely be doubted, when we see in the Hindoos alone every shade of colour, the shades being the effect of the comparative elevation of territory and comparative height of temperature. But the grand cause of variation appears to reside in a natural law for the production of varieties. This law is less obvious than it otherwise might be, in consequence of the apparently opposite one that the general character of parents is transmitted to offspring. It is nevertheless a prominent and most important feature of nature's economy, having apparently for its object a perpetual freshening and rejuvenescence of the stock of her many animated tribes. It is under favour of this law that an unusually able man—a Franklin or a Burns, for instance—occasionally arises from a race of simple and unthinking rustics. From such a man we may often see the like in succession, but he is himself the head and commencement of his own style of character. It is also seen that, in the domesticated tribes of animals, and in cultivated shrubs, new varieties are constantly arising. A sheep is born with short legs; it is bred from; and in time we see an English county full of short-legged sheep, the peculiarity being thought useful as disabling the animal for leaping fences. A violet or tulip with particular colours and form of leaves arises: it is selected for propagation on account of its beauty, and in a few years we see it spread every where over the country. It is not at all unlikely that some of the chief varieties of mankind—as the Mongolians (amongst whom are the Chinese), or the Caucasians (amongst whom are nearly the whole of the European nations)—have descended from one person, a cadet of another stock who happened to have received from nature qualities considerably different from those of his parents. The greatness of the number marked in one way can be no objection, when we remember that the whole Hebrew nation have a family likeness, known, from Egyptian monuments, to have been the same in the time of Moses, and which may therefore be presumed to be derived from Abraham or one of his immediate descendants. We have only to suppose one of these heads of varieties quitting the native territory with his family, and settling in some neighbouring vacant one, which his children in time peopled. And we can readily suppose that such a person would be just the most likely to pine for free space, and endeavour to obtain it. Subordinate varieties would arise from similar emigrations. In this variety-producing power of nature, evidently lies the chief cause of the numberless peculiarities which mark and distinguish the nations of the earth.

The distinguishing features of nations are to be traced quite as clearly in their mental character as in external form and colour. One is addicted to mystic learning; another to the elegant arts; a third runs wild in superstitious error. Even in savage nations, when we look narrowly into them, there are well-marked peculiarities of character. The variety-producing law of course includes the production of such characteristics. And thus we may contemplate the origin of the artistic mind of the Greeks as a phenomenon precisely analogous to the production of a Lawrence in an inn on the Bath road, or a Wilkie in the manse of a rural Scottish parson. The Gothic mind, with its sober thoughtfulness, perseverance, and tendency to good social institutions, has many a parallel in the rise of judicious and industrious individuals out of families where little of that kind of character is seen to prevail generally. Take any well-marked man at this day, and plant him in the midst of an ample unoccupied space, with married children around him, and, unquestionably, if his family spread over that space, as it probably would, if unrestrained, we should in a few hundred years find a new and peculiar nation arisen. It is only for want of space that phenomena on the same scale as the creation of the Greeks or the Goths do not now take place. Yet, even as the world now is, we see that a certain order of Englishmen, emigrating in company to form a *New* England, become the progenitors of a nation which, two hundred years from its origin, shows strong traces of the peculiar Anglicism which marked the so-called pilgrim fathers. Supposing that the first Puritan emigrants had been alone, and that their descendants had received no infusion of other races, can we doubt, from what we see, that the people of New England would have been, still more expressly than they are, a representation of a peculiar section of English society of the time of Charles the First?

Variety-production—that law by which nations of superior have sprung from nations of inferior endowment—may be considered as the highest that affects the natural history of our species. It produces great leaps in improvement, but these may be at long intervals, and their frequency must be much diminished as the earth becomes filled up with nations. There are other laws of less instant energy, but which work as remarkable effects in time. These work improvement by bringing superior to work upon inferior mental organisation, and by intermarriage of races. There is an inherent tendency in human nature to improve; but, like some other mental characteristics, it is in a great measure confined to a few nations, and to a limited class of even these. If any one wonders why it has been hitherto shown almost exclusively in the Gothic races, let him also wonder why the fine arts can scarcely be said to have ever risen spontaneously any where but on the shores of the Mediterranean. Apparently, the very highest degree of the endowment of any faculty is that which leads the possessor to its unprompted exercise, as when a boy attempts to draw, and draws well, who never saw or heard of limning. Of this nature is the case of those who have an inherent tendency to civilisation. But there are many who would never think on their own part of drawing, who, nevertheless, if tempted to take lessons, and induced to give attention, would become tolerable draughtsmen. So also are there many nations which, though not spontaneously disposed to civilisation, are susceptible of being civilised when the proper agency is brought to bear upon them. And it is very interesting to observe from history what a tendency the higher races have always shown to be the cultivators or educators of the inferior. It would almost appear as if there were providential arrangements in human nature to bring about this object. Higher races are generally restless, ambitious, and fruitful. Obeying the impulse of their nature to conquest, or simply breaking over their bounds in search of new fields of settlement, they tend to go in upon other nations, whom they perhaps injure and oppress for a time, but generally, in the long run, improve. The colonies of the Greeks, the conquests of the Romans, the overflow of the northern nations upon the Roman empire, the extension of the British race and power over Northern America, India, and many other parts of the earth, are instances of this disposition of superiorly endowed nations, while all the secondary races remain for ages

in defined bounds, and generally much isolated. The invasive system, when unregulated by just and humane views, is to be lamented; but we must not rashly and sweepingly condemn what has been so conspicuous a feature of human conduct from the beginning.

Superior natures, with all their acquired ideas, and systems, being, by whatever means, brought in contact with inferior, the latter are put, as it were, under a compulsion to improve. The law of improvement by external agency takes effect upon them, and usually a few generations see wonderful changes brought about. The Celtic Britons under the Romans, the Hindoos under the British of the present day, are examples. This is precisely the same phenomenon as the improvement which the great men of a nation work upon itself. In both cases, it is the highly endowed few acting beneficially upon the inferior many. Improvement in both instances goes on under certain remarkable conditions, which are well worthy of a particular notice. Here we are glad to look for illustration to the familiar phenomena of nature.

It has been fully ascertained that, even amongst the lower animals, an effect produced by external agency in the mental character of one generation, tends to reappear in the next as an inherent condition. This is conspicuously the case in those horses and dogs which have fallen particularly under human care. The act of the pointer, a result of training in past generations, is natural to a puppy of the tribe which never saw game. The amble of the American horse, the peculiar leap of the Irish, the docility to speech and not to the bridle shown by the hardy courser of Norway—all reappear in foals of the respective tribes which have been brought up in England.* Such facts can only be accounted for by supposing that the training or education works a certain organic change in the animal, for how otherwise could it be transmitted? Either the former material of the nervous system must be in some way modified, or new material must be added; and this new condition, whatever it is, becomes represented in the new generation. A change thus once set a-going must increase, for every new generation will start with not only the inherent character of the preceding, but all the benefit which that has derived from external agency. Such is the process which we recognise as the taming, as well as that which we call the training, of animals. Tameness in an animal originally wild, as, for instance, the common cow, may be regarded as simply the result of an exposure of the race during many generations to influences which evoked the gentler and stilled the fiercer feelings of the animal's nature. The tissues on which the fiercer feelings depended would, in obedience to the universal organic law, decline, while those on which the milder feelings depended would gain in volume and in strength. Hence, the milk-cow of our dairies must be organically a considerably different creature from her cousin who yet roams wild in Chillingham Park or amidst the woods of Cadzow.

As far as the mental constitution of the human race depends on the nervous system, the process of civilisation is precisely an analogous, though generally a more strongly developed, phenomenon. In the early stages of a society, the muscular and the more animal parts of the mental system are predominant, as we see in savages at this day. Intellectual and moral influences being brought into operation, those parts of the system are in some small degree less exercised, and consequently lose in volume and energy. The formative nutrition, diverted therefrom, goes to the intellectual and moral tissues, which it in some small degree increases. The next generation starts with this improvement, and experiences during its existence further benefit from the continued external agency. Thus, in the course of a number of generations, a change sufficiently considerable to be entitled to the term *civilisation* is effected. It is hardly necessary to remark, that this law is not definite in its operation, and that there is only a tendency upon the whole to such improvement in the sum of instances. We are more called upon to observe, that civilisations thus originating and going on are liable to be absorbed, overpowered, and deranged by various causes. A strong civilisation, coming in upon a weak, absorbs it. An isolated civilisation may be swamped by the irresistible brute force of a surrounding barbarism. Other external agencies, as, for instance, false maxims in the superior race, may derange the process. On all hands, throughout history, we see civilisations undergoing the most strangely varied fates. It is also very clear that some are wanting in certain of the elements that go to compose a great nation. There may be fineness of intellect without strength; delicacy without moral energy; industry without the power of self-defence. In all of these cases, there will be a tendency to break down and relapse into an inferior condition. Much must depend on whether the civilisation is produced by elements within the race itself, as the Germanic seems to have been—the highest and best we have yet known—and, in the case of a foreign element being the cause, what proportion the superior bears to the inferior race, and how far their various native qualities tend in union or fusion to form a good type; also how far they naturally tend to fusion. It was natural for the Normans and Saxons of the British isle to become fused in three centuries, for they were not very diverse; but in Ireland we have seen six centuries do scarcely any thing to bring the more discrepant elements of Saxon and Celt together. In some cases of extreme diversity, as in that of the African Negroes placed amongst the Anglo-Americans, we can contemplate no end to the natural antagonism; and civilisation will be of course in such cases retarded, or the one race will shrink and die out under the unfavourable effect of contact with the other.

History completely corresponds with physiology in its illustrations of this subject. The Greeks were a mixture of the Pelasgic and Hellenic races, the latter being not improbably of Gothic origin. Rome was first peopled by a collection of different races, and as it advanced, took in large infusions of new elements. The present English are composed of Celts, Romans, Saxons, and Normans. When the ingredients are not too unequal in character or numbers, assimilation goes on, and one good national type results. In the words of a predecessor in this walk of inquiry, "the national elements gravitate from the circumference to the centre—from diversity to one common character. And the inferior races being forced to decline and die away, in the same proportion as the stronger increase and multiply in numbers, a more equal degree of intellectual energy and a more equal physical type are thus attained, in the course of time, by the nation at large. Its civilisation is then completed to the full extent which the original powers of its races admitted, and its corresponding nervous system has arrived at its acme of development." *

It thus appears that man, in certain favourable circumstances, may arrive at what seems to be a comparatively advanced stage. The improvability, so to call it, is not strictly definite; yet we must conclude, from all analogy, that it has bounds, and that the present being must ever remain upon the whole the irregular impulsive creature which he has been.

We conclude these speculations with an expression of sincere regret that, being in some measure new and unexpected, our bounds do not allow us to support them by so large an amount of evidence as might be considered necessary. Researches into history by the light of science is a thing of yesterday, and as yet little has been done for it. But we entertain no doubt that physiology alone could throw more light upon the origin and progress of nations, within the bounds of one small volume, than could be done by a whole library of political history, or the united labours of a score of archaiological societies.

THE GOVERNESS.

BY MRS S. C. HALL.

PART SECOND.

EMILY DAWSON had been nearly four months in her situation; during that time Mr Byfield came and went, at Mr Hylier's, as usual; if he met his protegée on the stairs, he turned his head another way; he never asked a question about her, nor seemed to take the least interest in her proceedings; once or twice Mrs Hylier (who prided herself on her diplomacy) said something leading to the subject, but Mr Byfield silenced her in a way peculiarly his own.

"Why does Mr Byfield turn away from you, Miss Dawson?" inquired little Elizabeth Hylier. (Children are acute observers.) "He used to stop us on the stairs, and call us juvenile jades; now he looks so—and goes on. Have you been a naughty girl, dear Miss Dawson?"

"I hope not, Elizabeth," said the governess.

"I am sure not," added Caroline, the elder of the two; "I don't think you were ever naughty. When you were a little girl, you were always too steady—too serious—and"—— The young lady paused, and looked earnestly in her governess's face.

"Well, my dear, go on," said Miss Dawson, in her gentle voice.

"I would rather not say what I intended, for fear you would not like it," answered the girl; "and yet I should wish to say it."

"Then do, Caroline."

"I meant, too sad to be naughty, or like other girls."

"I was not always sad, my dear; though, I perceive, I must not let you see that I am so, even at times. If you say your lessons as well, and are as attentive as you have been this morning, I shall be much happier." Caroline Hylier flung her arms round Miss Dawson's neck, and kissed her, declaring that since such was the case, she would certainly do her best to improve; and while she was speaking, Mrs Hylier entered the schoolroom—a cloud of the deepest displeasure overshadowed her pretty face.

"Oh, mamma!" exclaimed Elizabeth, "Miss Dawson says that if we are good, she will be so much happier."

"I should have thought," observed the jealous mother, "that *my* being happier was of more consequence; is it not, Miss Dawson?"

"Certainly, ma'am," she replied.

"I *do* wish, Miss Dawson, you would not answer me in that peculiarly sad voice; and that everlasting mourning you wear—it makes me heart-broken to look at it."

"It nearly broke mine," said the poor girl, "to put it on."

"Well, there is no occasion to be sharp about it. I thought when you received your first quarter's salary, you would have changed it. Caroline, take your hand out of Miss Dawson's; I hate to see that sort of familiarity. Since you have both been so good, suppose you come and drive with me in the park."

"Oh, thank you, dear mamma!" exclaimed both the children, in the same delighted tone of voice, and rejoiced to see her temper changed.

"Thank you, that will be a treat; and, mamma," added Caroline, "may Miss Dawson come also?"

"Miss Dawson has had her drive this week already," said Mrs Hylier, walking out of the room with renewed ill temper.

"Let Elizabeth go, and I will stay with you," whispered the affectionate though spoiled child to Miss Dawson.

"No, indeed," she replied—"no, indeed; it was very kind of your mamma to ask you, and you will offend her if you do not go. I have a letter to write, and that will employ me until you return."

"Ah, you say that to make us go!" said Elizabeth.

"For shame, Lizzy! you know we never found Miss Dawson out in the very least little white fib in the world," observed Caroline.

"But that would not be a fib, would it, sister?—because mamma often says those kind of things to papa, to get him to do what she wants."

"You are too young, my dear Lizzy, to be able to judge of any one's motives," said Miss Dawson; "and in this instance must be mistaken. So now, dears, go, and do not keep mamma waiting."

Some persons, who had seen Miss Dawson by chance at Mrs Hylier's, although she was "only a governess," had been heard to observe that she was very pretty. Had she not been a governess, she could not have been looked at without being admired—not for actual beauty, but for the sweet gentleness of her countenance, the purity of her complexion, the open, truthful outlooking of her fine eyes, and the ease and grace of her movements. The deep mourning, which had excited Mrs Hylier's displeasure, made her an object of touching interest to all who had any feeling; it harmonised with the sad expression of her face; and two or three ladies, in open defiance of Mrs Hylier's well-known jealousy of disposition, had said, "how glad they would be if Miss Dawson would visit *their* young people"—invitations which she thankfully declined. When she was left alone—that luxury which her class so seldom enjoy—she opened her desk, and, after glancing over some letters, fixed her eyes upon a miniature which she had taken from a secret drawer. She looked at it long and steadily, until her eyes overflowed, and tear after tear, large round drops, coursed each other down her anguished face. She then wiped the salt moisture from its surface, looked again at the picture, pressed it convulsively within her clasped palms, and laying her head upon them, sobbed as if her heart was breaking. While sobbing, she slid from her seat upon her knees; her emotion gradually subsided. She prayed, rose, kissed the cherished picture, and murmuring, as she closed the case, "Mother—*my* mother!" replaced it in her desk. Strange as it may seem, after this agitation she became at once composed—it had done her good—the petty insults which, cherished child as she had been for so many years, she felt it hard to endure, had passed away with the deluge of tears that welled up from her young heart. She wondered how they could have grieved her—how she could have felt them—when the superior bitterness of her mother's loss came again upon her. Small sorrows place us below the world—a great sorrow above it; and she continued a letter, written at intervals, with a quieter and firmer mind than she had felt for some days. The letter was to a young lady, the sister of the curate who had attended her mother's deathbed: a portion of it ran thus:—"You ask me if I am happy: I ought to be happier than I am. My two pupils are kind, affectionate girls; and, though somewhat idle, and very ignorant, if I am permitted to manage them as I desire, I have no doubt they will improve—not rapidly, but certainly. I never could manage a child until I obtained its affections—and the affections of the young are generally ductile; but Mrs Hylier is weak enough to be jealous of the little love the children bear me. She does not understand that it is the only means I have of working out her, or what ought to be her, intention; but the truth is, that all she really desires them to know are a few showy accomplishments. She came home in an ecstacy of delight the other evening with a girl who repeated some long Italian poem—of which she could not even remember the name, much less understand the meaning—in a room crowded with company. 'The girl,' she said, 'had so much self-possession, and her action was so graceful.' With the same breath she declaimed against a woman's appearing on the stage. I ventured to observe, that the child who, at twelve years of age, would have sufficient confidence to *repeat* and *act* a poem in a crowded drawing-room, would be very likely to desire to exhibit before a larger audience as she grew older; but she could not perceive the analogy, and thought, indeed *said*, I was impertinent for making it. Is it not a cause of great regret that I have never yet found a mother who would act in concert with me? I submit quietly to be treated with indifference by the lady and gentleman, who, when I am in the room, speak and act exactly as if they were alone, except when

secrets are to be talked, when they begin to whisper, and then, of course, I leave the apartment. I find, when with my pupils, a deep, and happily an absorbing interest, in their improvement; but, when that excitement is over, I droop again; for I am considered an intruder when lessons are over, and an automaton while they are in progress. Shall I ever again hear the voice of encouragement, which makes the heart bound to its duties—*shall I ever be praised any more?* Oh, do not think, because I say this, that I yearn after flattery; I do not; but if the parent knew how kind considerate words increase the desire to bring the children forward—a smile—a gentle word—a simple 'you have done well,' would make the labour, the weary labour, of thankless teaching a pleasure. Mrs Hylier seldom finds fault; but she never utters a sound of commendation. And yet, why do I complain? You know that, for three years before my mother was taken from me, I toiled through the streets of that distant town, in the grey mists of the winter's mornings, as well as in the light of the summer's sun, teaching music here and drawing there—all the accomplishments in one place, and 'the sciences' in another; and as I had no protector—a creature to be insulted by those whose manly garb was certainly no index to a manly mind—I was dismissed from one house because the lady thought me too pretty to come in the way of her son; from another, because I did not wear caps, and looked too young without them; from another, because I would not lunch with the lady's maid; and yet I bore all this, and more, as you know, cheerfully, because from six in the evening until eight the next morning, I had the sheltering bosom of my mother. The abilities she had fostered were the means of supporting her at the last. In those two small cottage rooms *I had a home;* there was *her* smile, *her* voice, *her* counsel, and *her* prayer. I was some one's first object. She loved me; the tenderness of her whole life was poured into my heart, under every trial which a fatherless girl must endure, who has to grope her way through the world's darkness. Oh, my mother! my mother!—but tears will blot the page when I write of her! When I think of her, I feel suffocated; and I have no right to repine; only thus much—even a little kindness would make me work so cheerfully. With the education, and tastes, and feelings of a gentlewoman, it is hard to be treated as if I had neither education, nor taste, nor feeling. The lady's maid is a confidant; the housekeeper a mistress; the housemaid has half the day to herself; the governess——But this is idle; my mother would reprove me for it; she would tell me to do my duty in that state of life to which it has pleased God to call me, and leave the rest to Him. You know how she was deserted by her father in consequence of her marriage; and, according to her desire, her death was mentioned exactly as she wished. She thought that if her father saw it, he would seek out his grandchild. Perhaps he is dead!—at least, no notice has been taken of me; and if it had not been for the chance which threw me in the way of that strange old man, Mr Byfield, I might have been left upon the world without any occupation. He is certainly a very odd old man; he evinced a great degree of interest in me at first, but since he placed me here, has never spoken to me but once. I had been walking the other morning in the park for more than two hours with the children, and being tired, sat down upon one of the benches, while my children walked up and down with their cousin, as their mother wishes, and under the care of Mrs Gresham's French governess; he came so suddenly, that he quite took me by surprise. 'Are you growing lazy?' he inquired. 'I answered, No; but that I was not very well. 'And have you not found out,' he continued, 'that a governess has no right to be ill?' I answered, 'I knew that; and so was ill but seldom.' 'Do you jest with me?' he said, sternly. 'No, sir,' I replied; 'I speak the truth. If I were independent, I would yield most likely to a pain in my side, or, when my cough keeps me awake all night, send for a doctor. The world believes in the sickness that is heard of, rather than the sickness that must be examined into. No one sees my illness, so I am ill but seldom.' And then he looked so penetratingly into my face, and asked me how I had learned to reason? and I had it on my lip to answer, that I learned to reason by endeavouring to cease to feel, but thought the reply would seem pert from youth to age, so smiled, and held my peace; and when I smiled, he sighed so bitterly, and walked away, and then looked back, and returned and sat down by my side; then gazing in my face, he asked me if I had ever told a lie. And I said truly, in the sight of God, I believed I never had since I knew wrong from right. And then he answered, that I looked like truth, as all women did when they lied most. It was unwise, I know; but I had done nothing to deserve such an insult, and I told him so, without further parley, but as gently as I could, thanking him for the kindness he had shown to one who had no friend but God. Will you believe that he seemed no more moved by what I uttered in any one way, than if I had been dumb; only, when I had finished speaking, I could not repress the tears that would come—poor cowardly tears—I hate them so—those waters of a troubled heart; and then, shaking his head, he said——But I hear the voice of Mrs Gresham's French governess, so must say adieu for the present. If constant occupation did not increase my weakness, I daresay my spirits would revive; for I have a better lot than many. There is a poor teacher at Mrs Stonewell's school, and Ma'amselle Mercier tells me she has but fifteen pounds a-year, and remains at school all the vacations, to mend up the house linen. Adieu."

"Ah! there you are!" exclaimed the light breezy voice of Mademoiselle Mercier, as she ran up and kissed Emily Dawson on both cheeks. "Ah! mamie, why you not go a valk in the Parks? Ah! you English ladies are given to the mopes; and ven you have five moments to yourselves, instead of enjoy all, you make sorrow more sorrowful by thinking over him! Toujours gai! I have seen my maman this morning—she come from Paris to be bonne in Lady Craig's family, after educating Lady Craig. She has brought me such a charming parasol; she loves me so moche, my dear mothere! Ah! my dear, I beg your pardon, I forget; I did not mean to call your tears, chere Emily. I am thoughtless girl; and my mothere make me full of joy. Now, do not cry; bah!—there! I tell you, if you dry up your nice blue English eyes, I vill go and fetch my new parasol, and ve vill valk togethere in Kensington Garden for half hour. Madame Hylier, she say to Madame Gresham, they go three hours drive, and they are not gone two hours yet. Do come. Madame Gresham likes me to be vith you, you are so steady. All the company is in the garden by this time—and ve see such nice ladie and gentleman, almost like Longchamps."

Miss Dawson begged to be excused; she would rather stay at home; she had much to do; was not well; and urged a thousand reasons, but without effect. "As you please, my dear," said the now pouting French girl; "but it is unkind of you. Madame Gresham vill not let me go vith any other lady, and I nevere get a valk. Dat cher littel boy is such a plague ven ve go out---and he is avay. Now, do come; it is cruel of you for fancy to prevent me!" Emily did not continue to refuse, for she could not bear to be unkind; and drawing a thick crape veil over her face, she prepared to accompany the volatile but kind-hearted Frenchwoman. They were a national contrast those two girls;—the staid, quiet, graceful deportment of Emily Dawson, and the vivid, tripping, carefully careless *demarche* of Colette Mercier—the deep mourning of the English girl, and the tulip-like appearance of the French, in whose dress, though there were divers colours, there was perfect harmony. "You look pale and tired already, mamie," she said to Emily; "and we must not sit down in the gardens, I am told. But it would be most pleasant, those charming, lovely ladies, and handsome gentlemen, if they only vould look happy; but they do not---they look solemn, and valk dead marche in Saul; and yet, though I am but poor governess, I am happier than they. There, now, is an English governess with her pupils---how sad she look, poor girl! I vill tell you, Emily, vat my mothere tell me ven first I come to Englan'. 'Ma chere,' she say to me in confidance, 'do your duty as moche as you can, *vithout killing yourself.* Some families vill be *very kind* and goot to you; and out of seven that I taught in myself, one is good to me now, that is Lady Craig; but the rest forget the care and teachings. If you meet gratitude---which all who teach deserve from all who learn---turn up your eyes and bless God, but *do not expect it.* I know what young teachers think ven pains have been taken vith them, as I take vith you; they go to a situation full of the importance of their *duties.* Bah! till motheres treat governesses like gentlewomen, and feel that the very best part of what an honest teacher gives her pupils---the thoughts of her head and the feelings of her heart---cannot be paid for, though the machinery of teaching may, there can be no reciprocity of interest between them,'"

This Colette uttered rapidly, with her strong and peculiar accent, for her French had a flavouring of patois, of which even her English partook; and she laughed lightly when her speech was ended. "That," answered Miss Dawson, "is an easy theory, but a bad practice. No matter how you are treated, your duty remains the same; it cannot be performed with the same pleasure, but *it is the same!*"

"Vell, my dear, so let it be; torment the flesh off your bones—plague yourself to death—fag, fag—and see! At the last you vill have no more thanks for *your* heavy toil than I shall have for my light labour. Bah! half the people do not know the difference between a good and bad governess. My mothere, she say, how should they, until they are better educated themselves? Now, there, you act what you call conscientiously; you are thin, like a poor rush, and sigh when alone. I take it lightly; I do not trouble myself; I am fat, and laugh to myself. If you wear yourself to the bone, what do you satisfy?"

"My own conscience," replied Emily.

"Ah, vell, if you go on satisfying your sort of conscience, you vill soon have a bell ring over your grave," replied the French girl. "Ah!" she added, looking under her companion's bonnet—for they had been walking rather rapidly, and Emily was obliged to throw up her veil for air—"you smile at that; it is not smiling matter to die, and be put in the cold ground ven one is young, and the earth one great garden." Emily made no reply. "After all," resumed Colette, "I do not see so pretty parasol as mine vith any lady."

"It is very pretty, certainly," said Miss Dawson; "but I think it quite time to return home." She was urged to this remark by the stare of a couple of gentlemen, who, certainly not unobserved by Colette, had followed them for the last few minutes, and, despite their rapid footsteps, managed to escort them, as soldiers do their prisoners, to their own door.—Emily maintaining a dignified silence, and Colette divided between her national love for adventure and a certain womanly disdain of insulting impertinence, which together—one feeling acting one moment and another the next—prompted her to give vent to one or two clever sarcasms, which provoked and amused their tormentors.

Mrs Hylier and Mrs Gresham were at the breakfast-room door as they entered, evidently watching their return.

"I did not know you were going out, Miss Dawson," said Mrs Hylier, sternly.

"As the young ladies were with you, I thought I might accompany Ma'amselle," she answered.

"I do not approve of my governess walking with gentlemen," continued the lady, apparently unconscious that Miss Dawson had replied.

"Vat gentlemans?" exclaimed Miss Mercier, with an air of pretty astonishment.

"You know best, miss; but as you are not in my employment, I have nothing to say to you; I can only desire *my governess* not to do it again," persisted Mrs Hylier. "And I should like to know who the gentlemen were."

"And so should I, indeed, ma'am," said Miss Dawson, "most earnestly, though it would be to little purpose—for who would revenge an insult offered to me?"

"Oh! you should tell your patron saint, Mr Byfield," returned the lady, with an insulting laugh and a sneer, as she entered the breakfast-room with Mrs Gresham, and slapped the door in the face of the two girls.

While Colette muttered to herself in French, Miss Dawson turned slowly round to go up stairs, and saw the housemaid draw back her head from over the bannisters, while the footman did not think it necessary to conceal that he had heard the "blowing up," as *he* elegantly termed it, which his mistress gave "our governess."

Mrs Hylier threw herself into a chair, and, looking at Mrs Gresham, exclaimed, "Well, and what do you mean to do?"

"Why, nothing, sister; surely the poor girls cannot help it if impertinent men will follow them home."

"I know very well that French girl you have is good for nothing, and you have suffered her to encroach too much."

"I really cannot tell, sister," said the tranquil Mrs Gresham; "I had an excellent character with her, and though Mrs Ryal did say her accent is bad, I don't think she is a good judge; and one may go on changing for ever, just as she does, since that underbred daily governess of hers ran off with her own father's shopman. She has tried half-a-dozen; but, as Mr Gresham says, she gives her servants better wages than her teachers, and what can she expect?"

Again the ladies were interrupted by the entrance of Mrs Ryal, just as they had been when about to advertise.

"I felt it *my* duty, Mrs Hylier," she commenced, after the usual nothings of a morning visit had been exchanged—"I felt it a positive duty to tell you that all the people of Kensington are talking about you."

"I am glad they are so well employed," retorted Mrs Hylier, with a provoking smile.

"Then you are easily satisfied, my dear; but rather I should have said, they are talking about your governess, and your amazing gullibility. Indeed, they are hinting that Mr Hylier must have some particular reason for suffering such an inmate. Why—do—you—know—*who*—you—have—got---in---your---house?" These last words were pronounced with peculiar emphasis, and divided exactly as they are printed, the lady advancing her face close to Mrs Hylier's, and opening her eyelids so as to make her round eyes seem half as large again as they really were.

"Ye---s," stammered Mrs Hylier; "a go---verness."

"A---nonsense, my dear; she is not a bit better than she should be."

"Few of us are," said the meek Mrs Gresham, who, somehow or other---perhaps through the influence of a sensible husband, whom she was fortunate enough to love very much---was beginning to think occasionally, and to compare, which is the result of thought.

Mrs Ryal looked daggers at her for a moment, and then continued---"That old Byfield is a wretch."

"I always thought so," answered Mrs Hylier, not willing to be outdone in suspicion; "I always thought she was his daughter."

"His daughter! that would be milk-white innocence to the fact---she is much worse."

"Impossible!" said Mrs Gresham.

"He could not be so bad as that," observed Mrs Hylier.

"All men are bad," pronounced the decided Mrs Ryal; "all men are bad, as I tell my husband; but some are worse than others."

"You are mistaken---misinformed, I should have said," quoth the perplexed Mrs Hylier; "he has never taken the smallest notice of her since she has been here---never asked why she was not in the drawing-room. I even one day, thinking to put him in good humour, showed him a tulip she had worked in that everlasting tapestry of mine."

"Well, and what did he say?"

"Why, he called it---'Rubbish.'"

"Sheer art," said Mrs Ryal.

"I cannot believe he would put a person of bad character over my children," urged Mrs Hylier.

"Stuff!" exclaimed Mrs Ryal.

"And the object?"

"Ah! that rests in the secret recesses of the man's own wicked heart," said Mrs Ryal, with due emphasis; and then added, "To get at their motives is hard for us poor women; but the only way to get even at their acts, is by putting that and that together." This was said with an air of peculiar sagacity. "Now, let Mrs Gresham ask her popinjay of a governess, if, the other day in the park, Miss Dawson did not complain of being tired---now only fancy a governess, whose duty it is, *her positive duty*, to walk as long with her pupils as it is necessary they should walk---only fancy her being tired!---ah! ah! there is a *ruse* in the very excuse---if she did not sit down on a seat, and if Mr Byfield, who seems so strange and unconcerned about her here, did not come up, and not only sit down by her side, but take her hand; and then she sulked, and he went away, and came back again, and kept her hand in his, and there they sat like two lovers, in Hyde Park. It is really scandalous to repeat, and makes my cheeks all over in a glow. And to-day, my Mary was in Kensington Gardens---Mary, my own maid---and she saw your two governesses, ladies, flirting and

philandering about; and then, who should she also observe, watching the English girl's every movement, but old Byfield. Well, two dandified gentlemen came up, attracted, Mary says, by the lightness of their manner, and followed them home; but not unobserved; for the old gentleman, his face purple with jealousy"——

"Or the March wind," suggested Mrs Gresham.

"Kept at the other side of the way," continued Mrs Ryal, with a look of contempt at Mrs Gresham. "But that is not all. This morning I sent Mary with a letter to the post, and she overtook Mr Byfield's man, who was talking at the corner of Salter's to one of the butchers. 'Are you going to the post-office?' he said. 'Then will you put my master's letter in for me?' And so she took the letters—she is very obliging—and who should it be directed to but Miss Dawson!" Mrs Hylier rang the bell, and inquired of the servant if the governess had received a letter. The man said the three o'clock post had brought her one while she was out; that he believed it had not yet been taken to the school-room; as it was not in his department, could not exactly tell—would inquire—went down, and returned with the letter: it had been left on the kitchen dresser. The lady found no fault with the servant's unpardonable inattention; and when he had left the room, all declared it certainly was Mr Byfield's handwriting.

"Will you break the seal?" inquired Mrs Ryal, eyeing the letter longingly.

"Certainly not," answered Mrs Hylier.

"Ah!" said Mrs Ryal, with a sigh, "Mary says true enough, secrets *are* secrets since the packet envelopes came in; then have her down, and see how she will look when she opens it." Mrs Hylier's hand was on the bell, when Mrs Gresham interposed.

"Sister," she said, "it occurs to me that we may all be in error; and if so, how will you forgive yourself for wounding the feelings of a poor girl?"

"Feelings, indeed!" sneered Mrs Ryal; "why, I vow she has bewitched you as well as the men; can any thing be more evident?—at least, if she is innocent, give her an opportunity of clearing herself."

The bell was rung; and the governess, still smarting under the lash of the previous insult, was sent for.

The servant returned with an apology—would Mrs Hylier be so good as to excuse her for a few moments; the servant added, that Miss Dawson was crying.

"How I have sustained my spirits since she came into the house is extraordinary," observed Mrs Hylier, smelling her vinaigrette—"she is always sad."

"She has good reason, you may depend on it," said Mrs Ryal, significantly.

"I think so too," added Mrs Gresham, quietly.

"Really, sister," said Mrs Hylier, "to hear you talk of late, one would think I was a savage. I am sure it is quite enough to be plagued with great growing-up daughters, without those governesses; and if I mention school, Mr Hylier begins about morals. I wish you had had Miss Dawson, with all my heart."

"My French girl does pretty well; but Mr Gresham says she acts from habit, not principle; and that—but hush"—— Emily Dawson entered the room, while the traces of tears were yet fresh upon her fair young face; the earnest desire she had ever felt to perform her duty in the highest and most important vocation which a woman can be called upon to fulfil, had not only given an elevation to her countenance and manner, but an expression to her features which never accompanies a small or sordid mind; and whatever Mrs Hylier chose to say when she was not present, the superiority of mind was so manifest in the manner of the young governess, that, despite the presence of Mrs Ryal, she desired her to be seated, in a tone which signified a request. Then came the question, Had she met Mr Byfield in the Park—sat and conversed with him. To this she frankly answered "Yes," and seemed perfectly unconscious of the occasion of the smile and sneer that passed between Mrs Hylier and Mrs Ryal. She professed herself quite unable to account either for the countenance Mr Byfield had shown her at first, or his subsequent inequality of conduct. "He had," she said, "apparently befriended her for the very reason which made the world shun her—because she was friendless and poor." Then Mrs Hylier placed the letter in her hand, and with what Mrs Ryal afterwards termed "unpardonable effrontery," she opened it, and as she read, her countenance became radiant with pleasure.

"Well!" exclaimed the two ladies, actuated by the same impulse—"Well, have you any objection to our seeing that letter?"

"I cannot show it to Mrs Hylier," she replied, with perfect frankness, "because Mr Byfield desires me not to do so."

"Was ever such hardened impudence!" muttered Mrs Ryal.

"It is very kind—very—I am sure," continued Emily, reperusing the letter, and too much absorbed with and delighted by its contents to hear the remark Mrs Ryal made. "It is too—too much!"

"What is?" said Mrs Gresham.

"To take a lodging for me at Hampstead, where I am to remain for several months, until I get stronger and better—and all at his own expense. I remember when I would have been too proud to accept such a favour, thinking I could earn all I required; but of late I have been so weak—so"—— She looked from the gentle face of Mrs Gresham to the other ladies, and, astonished at the expression of displeasure and scorn on their countenances, she paused, and did not utter another word.

"I think, then, the sooner you leave my house the better," said Mrs Hylier—"the sooner the better. Oh, what will Mr Hylier say!"

"What have I done?" exclaimed Miss Dawson.

"Oh, what a world it is—to see such a face as that masking so much vice!" ejaculated Mrs Ryal.

"Are you aware what will be said if you place yourself under Mr Byfield's protection in this way?" inquired Mrs Gresham, still kindly.

"Let her go, by all means—there, you may go—and the sooner out of the house the better! Oh! to think of my having such a person as that to take care of my innocent children!" and Mrs Hylier, overpowered by a sudden fit of maternal love, fell into strong hysterics—tears are too weak testimonies of grief for ladies of feeling.

Emily walked up stairs, the open letter in her hand. Miss Mercier was still in the school-room.

"Ma'amselle," said Miss Dawson, "Mr Byfield has written to me that, knowing I am overworked and ill, he has taken for me a country lodging for a few months. You know who he is, and all about him?"

"And surely you are not going to accept that!" replied the French girl; "if you do, you lose character at once. No one evere do such a naughty thing as that; he must be bad man. Do, pray, send it back; young men sometimes make love for love, but old men always for vickedness; bah!"

Of all the difficult things in the world, it is the most difficult for people of the world to comprehend the unselfishness of the good.

"I don't know how it is," persisted Ma'amselle; "you are in life nearly as long as I am, and yet you don't know half so moche. Depend upon it, the old man is a bad man. If you go into the lodging he take, you nevere come out with a good charactere. Take my advice—I know more than you."

"Good-bye, Ma'amselle," said Emily; "thank you for your frankness. God bless you; leave me by myself to think a little."

When Emily was alone, she read the letter over again. The unaccountable interest Mr Byfield had taken in her as a stranger, did not seem so strange as the carelessness he had evinced towards her for so long a time. Emily Dawson's own pure mind could hardly conceive the possibility of what she had heard from Mrs Hylier and Mrs Ryal; but she had often been astonished at the acuteness of the Frenchwoman's perceptions. Could such baseness be possible? Her whole nature seemed changed in a moment; she trembled convulsively, fearing she knew not what; and, from suspecting nothing, she suspected every thing. Why should Mr Byfield forbid her mentioning the subject of his letter to Mrs Hylier?—why? But her brain whirled—she could not think. The housemaid entered the room; she was a kind girl, and in tears.

"Please, miss, my mistress says you're to go to-night," she said.

"Where?" inquired the governess, in a tone of such utter helplessness that it touched the poor thing to the heart.

"I'm sure I don't know, miss. She said you could be at no loss for a home; and here's the month's salary and month's warning money."

"Not to Mr Byfield," she thought; "I must not go there; they all say that; and yet this woman turns me out to the very vice she would have me shun. God help me—I am quite, quite alone!"

"Master will be in a fine way, *that I* know, when he comes home," continued the girl, good-naturedly busying herself packing up Miss Dawson's wardrobe. "I'm sure I hope you ain't going to Mr Byfield's; though I'm sure there's no harm, yet I hope you're not, miss. If you wouldn't be above it, my mother has a little pretty house at Chelsea, and you might be there till you could turn yourself about—safe, as one may say; and if so be you wish it, I'd be on my honour and my oath not to tell—not the old gentleman, or any one else."

"Any where, Mary—any where," said the governess, listlessly; "any where, away from all I have seen in this house."

Elizabeth, the youngest of her pupils, rushed into the room, and flinging her arms round her neck, sobbed—

"You shall not go, dear Miss Dawson—you *shall* not go. Mamma said I was not to come near you, you were so wicked; but I said I would."

"Your mamma mistakes," answered the governess, not even in the anguish of that hour forgetting how necessary it is to make the parent appear right always, at least in intention, in the eyes of the child. "She mistakes, dearest Elizabeth; she will not always think so; but you must not cling round me. God bless you, my dear child; you did wrong to come when mamma said you were not to do so. God bless you—be good, be truthful, and obedient; God bless you!" and with a gentle force she obliged the weeping child to leave the room.

A short time completed her preparations, or rather the preparations which Mary made for her. It is pleasant and cheering, and one of the brightest pages in the great book of human nature, to see the kindness which the poor bestow upon those who are in trouble. The evidence of the existence of this benevolent feeling is far more frequent than people imagine. It does not descend in showers of coin, but in words of kindness; and is as pure as the dew which an all-wise nature distils into the cups of drooping flowers.

"Let me tie your bonnet, miss, and pin your shawl. Lawk, how *numb* your hands are! Then, you'll go to my mother's, I think you said, miss, and no one shall know; she'll treat you as it becomes *her like* to treat a lady, rich or poor. The cab is ready. Now, keep a good heart, Miss Dawson; God is above us all. I'll open the door myself," she continued; "and the trunk is in; and keep up, miss—lies are found out sooner or later. Why," she exclaimed, seeing that Emily paused opposite the drawing-room, "surely you are not going to be more insulted? You might as well talk to a stone wall as to my missus."

Emily nevertheless entered the apartment, where Mrs Hylier was alone, pondering over, in no pleasant mood, the occurrences of the past hours—thinking how she had acted in decided opposition to her husband's desire, who willed it that Mr Byfield was never to be contradicted, at least in his house; and though she was half-convinced of Emily's unworthiness, she knew how hard it would be to convince him. The pale shrouded girl walked silently up to where Mrs Hylier was seated. "I come," she said, "to bid you remember what I say—that you will (heartless as you are) shed tears before long for the injustice and insult you have heaped upon the head of a houseless, homeless orphan. You have done me cruel wrong by your suspicion, and you send me forth to make the suspicion real; but the God who is above all will save me yet!"

She spoke these few words in the tone of a breaking heart, and without further words she quitted the house. During the short time of her residence there, she had conferred more lasting service upon Mrs Hylier's children than they had ever received before—she had sown healthful and truthful seed. Not content with the teaching by lessons, she had hallowed every tree, and leaf, and blade of grass, with a history. She placed a few brilliant and beautiful shells in their way, and then, without dull or dry detail, she interested them in the desire for knowledge as to where they came from and to what class they belonged. The music lesson was made of historic value by the record, if the task had been attended to, of its author, and an anecdote that bore upon its composition. The analysation of a flower became a botanical lesson, without its pedantry; and every thing she had touched upon in science and art—two words which her pupils had imbibed a hatred for, from lengthy catechisms and dry details—were illuminated at once by her simple and happy method of conveying instruction. A new existence dawned upon their minds: they understood *why* their hoop rolled, and *why* it came to the ground; they understood why morning followed night, and why the heat was at noon the most intense. They had learned more *orally* than they had ever learned from books. Poor Emily knew this; and as her arm encircled her trunk, and her hot fevered breath hung upon the closed windows of the rattling cab, which was taking her she knew not where, the words of the French teacher rang in her ears—"Torment the flesh off your bones—plague yourself to death—fag, fag—and see! At the last, you will have no more thanks for your heavy toil than I shall have for my light labour." "Still," she murmured, "I have done my duty."

"Please, ma'am," said the man to an elderly woman who opened the door of a small house, "here's a lady, like, your daughter in Kensington has sent you, as a lodger; and you are to be particular kind to her, and she'll try and run down to-morrow night, between lights. The fare is paid, miss—the young woman paid it. She said she knew you hadn't changed your cheque."

Mary's mother did not look as good-natured as Mary herself. But Emily was so bowed down by circumstances as hardly to observe the difference.

"Well," observed the woman to her youngest daughter—"well, I never saw any one so careless about accommodation. Why, she said the back would do as well as the front room, though I told her she might have either at the same rent; and if I had not undressed her, she'd have either sat up all night, or lain down in her clothes. She's more like a dead than a living woman."

ECONOMICS OF THE MANSE.

A FEW years ago, the Rev. Dr Paterson, a clergyman of the Scottish Established Church, wrote a remarkably pleasant volume, styled "The Manse Garden," with the design of improving his brethren in the very laudable art of laying out and making the most of their small gardens; and we understand that it has met with the success which its merits as well as its benevolent intentions deserved. The Scottish clergy seldom travel into the field of authorcraft—the better, perhaps, for their flocks, as well as for their own pockets, as we publishers are apt to present rather startling balance-sheets to gentlemen who print on their own account. The reverend author of the above production was so well aware of the danger of such adventures, that, with his usual kindness, he tells his clerical friends by all means to beware of being afflicted with that awful calamity, "the bite"—the itching desire to appear in print.

In spite of these obliging hints, however, a minister occasionally gets infected with the disease; and it now appears that one, a venerable father in his district, has plucked up courage to emulate Dr Paterson in his own line, having just ushered into existence a volume of a similar character, referring to all the odd matters which may be supposed to concern a clergyman in the management of his rural possessions. It is entitled, "Clerical Economics; or Hints, Rural and Household, to Ministers and Others of Limited Income,"* and we must say that we like it fully as well as "The Manse Garden." Its author is one of those delightful clergymen of the old school, who, with much good sense in their composition, think it no crime to be cheerful, and occasionally to go the length of saying something jocular in their own quiet way. At the opening of his budget, the reverend father—who, by the way, and it is well to keep the fact in mind, has no more than L.150 per annum to keep soul and body together, and present a decent face to the world—has much to say about how to battle with heritors,† a class of beings whom he considers no better than they should be. Hear him: "The fund from which the stipend is drawn never did belong to the landed interest. On the contrary, it belongs as much to the church as the coat on the heritor's back does to the heritor himself. Every body knows that the teinds and church-lands were wrenched from the church at the Reformation. The very king joined in the scramble for a share of the plunder. Not only were castles, manors, monasteries, with extensive domains, lavished on lazy court fa-

* One neat small volume. Edinburgh: John Johnston. London: R. Groombridge. 1842.

† Those landed gentry who pay the stipends of the clergy in Scotland are termed *heritors*—properly, inheritors of teinds or tithes.

vourites during the reign of James VI., but even the tithes of the whole other lands were given away to the retainers of the court with the most unbounded profusion—reserving only a mere competency for one person to serve the cure in each parish, and which, at the high value of money in those days, and the austere lives of the reformed ministers, amounted to but a small sum. In this way the titulars (many of whom derive thousands yearly from this source) and the ministers may be compared to a commonwealth of bees, where the industrious and active little insects having collected and laid up stores of honey, the large and lazy drones fall and fatten upon it. But the bees manage the matter in the long run better than the church, inasmuch as the bees act on the principle of common sense and common justice, that they who won't work are not permitted to eat."

Our friend is here a little out in his explanations; for the *purpose* to which the church property was originally assigned, is not compatible in all its extent with the reformed model: but let that pass. Bad as the heritors are, in the author's opinion, they are perfect lambs in comparison with the Commissioners of Teinds, who allocate the stipends, and whose decisions are all, as he says, founded on the belief that a church is always best established on the rock of poverty, and that the only plan for ensuring "a *pure* kirk is to have a *poor* kirk;" a saying which, he thinks, may be a very good joke, but is any thing but good logic to a parish minister on a trifle under three pounds a-week. With a salutary horror of an appeal to such personages, he counsels great caution in the attack, whether for a rise of another chalder of stipend, or a new manse. "A minister should be well advised before he takes legal steps to enforce an augmentation of stipend, that is, in the present spirit of the times. The measures are, in nine cases out of ten, very rashly gone about. It should be managed, *if possible*, at home in the meantime. It should be set about a year or two before the period expires; and it should even be delayed a year after, rather than give the blow. The heritors should be plied individually, and by their own firesides. They should not be driven to an absolute refusal, because, after giving one, they will keep by it. They should be tried once and again, and, after all, they should get a little of their own way; and, above every thing, the minister should not startle them by urging unreasonable demands. After the matter has been brought to an amicable adjustment, a mutual minute should be entered into, and the Teind Court merely required to give a legal sanction to it. A minister, upon the whole, should rather trust to the tender mercies of his own heritors, cruel as their tender mercies often are, and poor and greedy as some of them may be, than to the domineering fiats of the Court of Teinds." He upholds that the generally limited stipends are scandalous in the extreme, considering how much the heritors retain on no principle of justice, and that there should be, at all events, "ten or twelve livings worth L.1200 or L.1500 a-year, as pinnacles to which men of superior talents and activity might aspire. The dead-level system of sixteen chalders is like the Dead Sea, in which the fish can hardly live."

Having finished his preliminary advices on these ticklish points, our author proceeds to the more enlarged object of his work—house furnishing and management in all their details, marriage, education of a family, management of the glebe, buying and keeping a horse, live stock, and so forth; all which is described in a business sort of way, and, we doubt not, will have due effect on young and somewhat heedless ministers in their new and trying situation. As to furniture, he says—"In furnishing the manse, count well the cost, and the funds on hand or in prospect. Buy almost every thing new and of good quality; for here, as in every thing else, the best is the best pennyworth. But take care not to purchase more than you can manage to pay. If prudence require it, furnish only one spare bed-room, your own sleeping apartment, and the parlour, with all the indispensable necessaries of the kitchen. These any minister may pay out of his first term's stipend; and these may see him over his first sacrament in a way far more respectable than with a houseful of unpaid furniture. Then, again, the dining-room may be furnished—that is, carpets, chairs, and table, and sideboard too—if it can be overtaken: and the best bed-room, leaving, of course, the drawing-room to be furnished at the sight and with the advice of the wife"—good advices to others besides clergymen.

He by no means recommends bachelorhood, and for various weighty reasons. First, a bachelor is not master of his own house. "It might be worth while for somebody to calculate, by duly weighing the real facts, what influence any man has over his own establishment, or rather, to try to ascertain whether he has any at all. It is obvious to every penetrating eye, that the bachelors have no more to say at home than one of their own hens. In the presence of strangers, the bachelor has generally the advantage; but at times, as much occurs as intimates that the point is as far from being settled as the boundary lines between the Canadas and the United States. How the matter goes on when they are left by themselves, none of them has ever told." Married men, he continues, have not all their own way; but, from affection and interest, they are differently situated; they "generally give up one-half of the authority to their wives, knowing well, that if they don't, they may lose the whole." Bachelorhood is altogether out of the question in the manse, and he tells all who are in this unhappy condition "to take a thought and mend." But who, he adds, inquiringly, "is a confirmed bachelor, and where is he to be found? He is that solitary, melancholic, and monkish man, which is the most to be pitied of all living beings at the manse. But take his own word for it, and the confirmed bachelor is no more to be met with than a mermaid is; for nobody takes the compliment to himself, or will allow it to be given to him. While the matter is doubtful, and so long as a gleam of hope tells the flattering tale of joys never to come, the grey-haired squire boasts of the appellation, and plays off his jokes with dexterity in defence of his own order; but ask the unmarried man of fourscore years, 'How old art thou?' and he will blink the question. Advise him to marry, and he will admit that he has not given up thoughts of it; and he is always the most earnest in urging his young friends to take a wife.

But whether you be a confirmed bachelor, or one merely for a year or two by a concurrence of untoward circumstances, the word of command is—'Go marry, sir;' and know, before you die, what the words comfort, and kindly feelings, and clerical economy, mean. Be selfish and recluse no longer, but give your affections, and a portion of your worldly means, to one who will double your joys, and divide all your sorrows. Instead of misspending these on birds, cats, and dogs—great and small, black, white, and spotted—select an object more worthy of it than four-footed animals and creeping things. Instead of yawning over a book as your dumb and daily companion, smile rather on the faces of a blooming and joyous family, as the only way to make home a place of rest and happiness. Furnish your manse as you may with easy chairs, sofas, and settees—have a vapour, a shower, and a plunge bath, cold, warm, or tepid—have a snug porch, and a green door, with a fan light, and a stove in the lobby, with a flue of heated air up the main staircase to the top—have a roaring fire in the parlour every morning before breakfast, with all sorts of antique fire-screens, large and little—have a fiddle, a solitaire, a tobacco-pipe, or a set of stocking-wires, to vary your occupations—when you go for an hour to snuff up the east wind, put on your cork soles, overalls, and dreadnought—go to bed at midnight, or long after it, and rise far on in the afternoon, when the day has been well aired—have all this, and four times more; but still, my good friend, so long as you want THE WIFE, there is a coldness, a formality, and a prim correct sort of bachelorism in the whole affair, which, happily, is never to be found when there are three or four boys romping about. Children may occasion many cares, but without them there are few real comforts. 'Little children are as arrows in the hands of a mighty man. Happy is the man that hath his quiver full of them. He shall not be ashamed, but shall speak with the enemies in the gate.' Nay, children bring not only their pleasure, mixed with care, but more solid advantages; they become, very soon, so many assistants and props to the parents, who, when old age comes on, are amply repaid for all the toil and all the anxiety the family have occasioned in their infancy."

This panegyric on matrimony leads to the very natural question—"Who should a minister marry? One somewhat of a minister's own station in life and age? Most undoubtedly. With money? Yes, as a mean, but not as an end. A wife who brings one hundred pounds a-year, and spends two, is not a profitable bargain. One penny *in* the wife is often better than two *with* her. A wife of your own flock? It may do tolerably well if the minister be endowed, and the lady wealthy; but, otherwise, it often proves hazardous. Above and beyond every thing, don't let the minister of a royal burgh cleave unto an old resident in his own town. If he does, he will not have his sorrows to seek, inasmuch as he will find himself harnessed at once and for ever to every *clishmaclaver* for the last fifty years, and to all the family feuds within the royalty, and to all the personal and party politics of a small constituency."

Talking of house affairs, he comes to the delicate subject of visiting and being visited, and recommends his brethren to be any thing but shabby in the way of giving "a party" within reasonable bounds. "Let no minister," says he, "be stingy enough to accept of dinners, unless he gives them in return as often as he can conveniently afford it." Much may be done, he thinks, by proper economy of liquors, which are always the most expensive thing in these affairs. He says that no minister should "ape a variety of wines: let him be thankful if he can muster, on an occasion of this kind, good sherry and port." As to who should be invited to his parties, why, the greater portion of his "brethren and their families; for nothing is more truly contemptible than for a minister to try to play the little colonel in a country side; if he does, he is sure to be despised by his own order, and laughed at by that of every other."

Our reverend economist discusses the question of a dairy, and, on the whole, advises keeping at any rate one cow; but the buying of the animal must be carefully gone about, dealers in the article being little better than horse-jockeys. If the minister venture upon the business himself, cows may be exhibited; but "either they are not good milkers and go all to beef, or they are in danger every time at the calving; or they give a reaming handful of rich milk, and then kick it over with their foot; or they break fences, or break the binding, and gore their neighbour. But you need scarcely ask any questions of the cow-dealer as to these matters, unless you know him, because your doing so will only tempt him to heap one falsehood on another as long as the conversation lasts. You must make your eyes your merchant, and take your chance of all contingencies." As to finding food for the cow, manage to have as much pasture as will afford her a full bite for the summer; and with respect to winter fodder, buy it any where but by personal appearance at an auction of growing crops. "Attending a roup is not a very becoming position for the minister of a parish. Besides, it is cold, sometimes wet, and always idle or tiresome; and as for bidding for any article, that is entirely out of the question, because the moment you lift a lip, a sort of persuasionary feeling goes round, that the poor man should be helped at the cost of the minister, 'who wins his money by the wind o' his mouth.' By way of keeping up the *fun*, as they call it, one man acts the part of 'white bonnet,' and another whispers into the minister's lug to stand to it, as the lot is far under value. Instead of attending a public roup, to be both cheated and laughed at, employ one of the elders, or a canny cautious neighbour."

A few pages further on, we find the very reasonable recommendation—"Let every manse have, at least, twenty stone Dutch of bacon hams and pickled pork every year; it may be thirty." These comforts he proposes to obtain at the very moderate "expenditure of half-a-dozen bolls of potatoes at the utmost, and of L.1 or 30s. for meal." But you must look to the proper management of the pig, and not only give him his meals regularly, but keep him in the nicest state of cleanliness. "Show an economist the pig, and in one moment he knows how all is going on at the manse. If he hears it squealing, and sees it climbing the stone walls, and labouring to turn up the pavement, he knows that the poor animal has not got its breakfast, just because there was no breakfast made ready to give it. Let an eye be cast into its bedstead, and he will find it so wet and dirty, that the creature is compelled to sit shivering in a corner, till rheumatism, crinkets, and death itself, close the career; this is not only cruelty, but cruelty worthy of a savage. If he find grumphy so lazy that nothing but a stroke will raise him, and lying among clean dry straw in great plenty—if he find him large, fat, and long in all his proportions but his nose—then the visiter may depend on having a good fat ham as part of his dinner, and well-aired sheets on his bed"—a hint which, we hope, will not be lost on pig-keepers.

Having now presented a tolerably varied specimen of "Clerical Economics," we can only add that, as embracing much that is exceedingly useful to residents in the country, of whatever profession, and being evidently the production of an amiable and intelligent man, deserving of better things than fortune has brought to his door, we cordially recommend it to public support.

BIOGRAPHIC SKETCHES.

PATRICK HENRY, THE ORATOR.

SECOND only to Washington in the estimation of the people of the North American union, at the era of their Revolution, stood Patrick Henry, usually called The Orator of Virginia. In Hanover County, in that colony, he first saw the light on the 29th of May 1736. His father kept a grammar-school of the humbler order; and in this seminary did young Henry acquire the rudiments of Latin, which, with a slight tincture of mathematics, formed the extent of his regular education. In his boyhood, he is said to have shown a strong aversion to study, preferring greatly to indulge in the sports of the forest, the hill, and the lake, and almost always following such pursuits alone. But it was also observed of him, by the more sharp-sighted, that the quickness of his perceptions, and strength of his memory, made up in a great measure for the want of the power of close application; and that no remark of any importance could be made in his presence without being retained on his mind, heedless as he might at the time seem to be. On the whole, however, he was regarded by most people as an indolent and unpromising boy; and, his love of solitude having induced careless habits as to dress and demeanour, no external qualities appeared in him to redeem his other deficiencies.

As he was one of a family of nine children, his parents were glad to get him placed behind the counter of a small store-shop, in a country village. Thence he emerged at a very early age, and prematurely commenced business for himself. The speculation was entered on almost without capital, and soon proved unfortunate, partly, it is related, because, in place of studying the wishes of his customers, Henry took into his head the fancy of studying their characters. The knowledge which he thus acquired of human nature might enable him in after days to wield at will the fierce democracy, but it was ill calculated to improve his temporary fortunes. These were rendered still less promising by his falling in love with a Miss Shelton, and marrying her, at the age of eighteen, she being as poorly provided with funds as himself. Nevertheless, on the failure of the mercantile concern, the friends of the young pair raised a sufficiency of money to place them in a small farm, with two negroes as helps. It is admitted that Henry toiled here in a manner deserving of success; but he was ignorant of farming affairs, and was weighed down by previous debts. Two years passed away, and found

him again a ruined man; nor was a second mercantile attempt one whit more successful than the former.

Burdened with a family, overwhelmed by pecuniary engagements, and set down by all as a man doomed to misfortune, Patrick Henry, now twenty-four years of age, might almost have been pardoned for sinking into despondency. But this was not in his nature. Though others, strangely enough, seem not as yet to have descried in him the marks of a powerful intellect, he himself certainly felt the sustaining consciousness that he did possess powers, for the development of which opportunity alone was required. The direction in which he turned his thoughts at this critical period, sufficiently shows that he even had a glimmering internal sense of what was his greatest gift. He resolved to become a candidate for the *bar*. After six weeks' preparation, he presented himself before the three examiners, whose signatures were preliminary to a call, and two of them signed for him, apparently out of mere good nature. But the third, Mr John Randolph, a polished man of the old school, revolted so much at the rough and uncouth appearance of the candidate, that he refused even to examine him. Being at length induced to do so, he received a very great surprise indeed. On a mooted point of law, Henry, guided by the force, simply, of natural reason, not only astonished the examiner by the acuteness of his views and the splendour of his illustrations, but even caught the great lawyer tripping, as a reference to authorities proved. Randolph confessed his error, and generously predicted a career of fame and honour for Henry, if his industry proved equal to his genius.

Notwithstanding this encouraging prognostication, three years of penury were yet in store for the patronless Henry; and during this interval he was reduced to live with his father-in-law, in whose small inn he was not infrequently necessitated to fulfil a waiter's duties. But from this humiliating position he wanted only the aid of occasion to extricate him, and, almost accidentally, the occasion at length was granted to him. The Virginian clergy and their parishioners had a quarrel, which ultimately resolved itself into a question of damages. The clergy, much better supported than their opponents, seemed to be certain of casting the people in heavy costs. The advocate for the people became disheartened, and threw up the case; and Patrick Henry, almost as a last resource, was engaged in his stead. The day of his first appearance was every way a trying one. On the bench of the court sat not only the judges, but a large body of clergymen, the most learned men of the province; and the house itself was crowded by an eager multitude. As if to try the young advocate even more, his own father was present in an official capacity. After a clear and able address for the clergy, Patrick Henry rose. Well, at that moment, might he have felt in imagination the hands of his little children tugging at his gown, as Lord Erskine says he did on a similar occasion. The appearance of Henry was not calculated to prepossess his hearers in his favour, nor did such an effect result from his opening sentences. On the contrary, they fell so flatly from his lips, that the clergy began to nod and leer at each other, and the speaker's father hung down his head. But the scene soon changed. "As Henry warmed (to use the language of one of his biographers), he seemed to shed his nature—the rustic shell fell from him—his person seemed to undergo a mystical transformation—his mien became majestic—his eye flashed fire—the tones of his voice fell directly upon the heart—and he stood before his mute and vassal auditory, a creature of inspiration. The effect was incredible. Appalled by the fury of one of his terrible invectives, the clergy fled affrighted from the bench; and the jury, obedient to his bidding, returned a verdict of one penny damages." This memorable speech gave a proverbial phrase to Virginia, where a specially good speaker is still talked of as "being almost equal to Patrick Henry when he pleaded against the parsons."

Few orators, indeed, from Demosthenes down to our greatest moderns, have blazed forth in the perfection of their powers on their first trial. But Henry was the orator of nature, and to him art and practice were unnecessary. During his whole life, natural sense and genius, not acquired knowledge, guided him. After his opening display, he removed to Louisa county, and, carrying his reputation with him, received a large share of the somewhat meagre practice of these courts. His professional exertions of this era can only be spoken of generally, but, by all accounts, they were surprisingly brilliant. The verdicts of juries and the applause of judges, testify to this fact. But the time came when Patrick Henry was to step into a mightier arena, and employ his energies on a cause of almost unparalleled magnitude and importance. Immediately after the obnoxious Stamp Act of 1764–65 had spread a ferment among the North American colonists, Henry, at that time almost adored by the people, among whom he was ever proud to rank himself, was elected a member of the Legislature of Virginia. During the whole of the ensuing short sitting, Henry seems to have waited in the expectation that the deepening murmurs of the people would find condensed expression by some voice more authoritative than his own; but the boldest were content to sit in gloomy silence. At length, "alone, unadvised, and unassisted," as he himself tells us, Henry determined to step forth; and he proposed, in May 1765, his famous Five Resolutions, one of which asserted the sole right of the colony to tax itself, being a virtual declaration of independence. The torrent of eloquence which Henry poured forth in support of these resolutions bore down all opposition, and they were carried by a majority of *one*. We have but one sentence left to show us what the speech of Henry was. It is a sentence equally marked by power and self-possession. In the midst of his invective he exclaimed, "Cæsar had his Brutus—Charles the First his Cromwell—and George the Third" ("Treason!" cried the speaker, and "Treason!" was re-echoed on all sides)—"Yes," continued Henry, never faltering for a moment, and fixing an eye of fire on the speaker, "and George the Third—*may profit by their example*. If this be treason, make the most of it."

The resolutions of Henry involved, as has been said, the principle of independence; but the critical struggle did not immediately follow. It was only brought on by the tea affair at Boston in 1774. The subject of our memoir was then startled anew by the armies which Britain was silently collecting in the Canadas. He thundered forth to the Virginian legislature a speech which rang through the whole colonies like the summons of a new Demosthenes—"Let us march against Philip; let us conquer or die!" He called for an armed organisation, and, pointing to the British forces in the north, he demanded what enemies Great Britain had in America to require and employ these. "She has none," he himself replied. "They are meant for us; they can be meant for no other. They are sent over to bind and rivet upon us those chains, which the British ministry have so long been forging. And what have we to oppose to them? Shall we try argument? Sir, we have been trying that for the last ten years. We have done every thing which could be done to avert the storm which is coming on. We have petitioned—we have remonstrated—we have supplicated—we have prostrated ourselves before the throne, and have implored its interposition to arrest the tyrannical hands of the ministry and the parliament. Our petitions have been slighted—our remonstrances have produced additional violence and insult—our supplications have been disregarded—and we have been spurned with contempt from the foot of the throne. In vain, after these things, may we indulge the fond hope of peace and reconciliation. There is no longer any room for hope. If we wish to be free—if we mean to preserve inviolate those inestimable privileges for which we have been so long contending—if we mean not basely to abandon the noble struggle in which we have been so long engaged, and which we have pledged ourselves never to abandon, until the glorious object of our contest shall be obtained—*we must fight!* I repeat it, sir—*we must fight!* * * * * * I know not what course others may take; but as for me (cried he, his arms raised aloft, his brow knit, and his whole frame as if on fire with the enthusiasm which inflamed him), give me liberty, or give me death!" These heart-stirring passages show, that, though Henry's delivery may have been as magically impressive as it is said to have been, yet his oratory rested not for its effect on that charm alone.

Patrick Henry's speech threw Virginia into arms, and decided the character of the coming contest, giving it a warlike complexion. Nor did he hesitate to follow up his words by acts. At the Virginian capital of Williamsburgh, twenty barrels of gunpowder were taken from the state by orders of Lord Dunmore, in order to cripple their means. Henry instantly stepped forward, harangued the people of Newcastle, and soon after marched upon Williamsburgh at the head of a large force. Lord Dunmore was forced to submit, and make full restitution. When the contest fairly broke out, the subject of our memoir headed the first warlike operations in Virginia, and received a high command in the army. Some slight led him to resign, but he was even more usefully employed in the government of Virginia, which he held three several times. His countrymen would have elected him again, but, jealous even of his own assumption of a monopoly of honours, the patriot firmly refused. When peace was established, Henry confirmed the high opinions of his statesmanship, which he had earned by his provincial management, by the share he took in laying the foundations of the new republic. More particularly did he show at once his wisdom and his humanity by coming forward, in the face of the most bitter opposition, to advocate the recall of the British refugees. This conduct was the more peculiarly honourable to him, as his fortunes had suffered so severely during the seventeen years' turmoil, that he was compelled, at the age of fifty, to quit public life, and return to the bar. The speech pronounced by him on this occasion is a model of subdued and reflective eloquence. His peroration said to the Assembly—"Discard from your bosoms fears so groundless and prejudices so disgraceful—unfetter commerce—let her be free as air; depend upon it, she will range the whole creation, and return on the wings of the four winds of heaven to bless the land with plenty." His proposition was carried, and its beneficial effects were soon seen in the peopling of the yet untrodden wilds of the country.

So high was the reputation of Henry, that within six years after his return to the bar, he was enabled to retire with an ample independence. Some of his speeches of this era have been preserved, and more particularly one on the question whether British subjects were entitled to the payment of debts contracted to them before the war. Henry was employed to argue the negative by the Virginians involved; and his speech, which lasted for a whole day, would alone suffice to prove that the commanding order of his intellect was the real source of Henry's success. His main argument was, that the British confiscated and ruined all opposed to them as far as they were able. But we are to view Henry as an employed lawyer here. His advocacy of the recall of the British shows how little illiberality there really lay in his own heart.

Henry stepped out again on the floor of the Virginian Assembly, to which the mere wish introduced him at will, when the new constitution was proposed. He was a sincere republican, and not even his deep regard for Washington could prevent him from feeling and expressing alarm at the creation of a presidentship. He beheld in such an officer but a disguised monarch, and trembled at the danger that might arise from the power and favour of an army. He was unsuccessful in his opposition in the Virginian senate, but, sincere in his sentiments, he stood a candidate for and obtained a seat in the National Congress, determined still to oppose it there. But, though his mental energies were unimpaired, his health had now begun to fail, and ere the congress met, Patrick Henry was in his grave. He expired on the 6th of June, 1799. In the year before he died, it may be mentioned, Bonaparte had overthrown a series of Austrian armies, and Henry was heard confidently to predict the occurrence in France of what he dreaded even in his own more steady country. If Washington nobly falsified his fears, Bonaparte fully proved his prophetic foresight.

Every successive step which Patrick Henry took in his course through life, showed him to be no ephemeral upshoot of an hour, but a great-minded and great-hearted being, fitted, in spite of defects in his early opportunities, to exercise a comprehensive influence on his age. He must ever rank among the great founders of American liberty. No man can be named, indeed, who so directly contributed to nurse the spirit which led to that mighty and important issue. His high position was at the time marked by an English journalist who sneered at the American struggle as a revolution attempted by "a small farmer, a petty lawyer, and a journeyman printer"—Washington, Henry, and Franklin!

VISIT TO THE MORAVIAN ESTABLISHMENTS ON THE CONTINENT.

THE modest and useful Protestant body who take the name of the United Brethren, but are more generally called Moravians, originated early in the last century amongst the descendants of some of those Bohemians who had rallied round John Huss and Jerome of Prague. Obliged by persecution to leave their own country, they wandered into Germany, and one considerable party found refuge at Berthelsdorf in Upper Lusatia, under the protection of a nobleman, Count Zinzendorf, who had long entertained a desire to establish a religious community in imitation of the Christian congregations of apostolic times. Here commenced, in 1727, the celebrated colony of Herrnhut, to which Zinzendorf in time gave up his whole property, and which, in the progress of time, has become the parent of a considerable number of similar establishments in continental Europe, in England, and in America. The Moravians are orthodox evangelical Protestants; but they are not so anxious about speculative points in divinity, or questions as to polity and discipline, as to see the gospel working its proper effects upon individual character. Their communities are associations in which some of the members are, with respect to worldly matters, independent, while others work in subserviency to a general interest, the whole being morally and religiously under one set of regulations. They have contributed in a very remarkable manner to the missionary cause, their chief settlements of that nature being in South Africa, the West Indies, Labrador, and Greenland. It is remarked that, wherever they have penetrated among heathen nations, they have wrought surprising changes in the habits of the people, introducing the social arrangements and industrious operations of the civilised world, as well as the superior light of the Christian faith.

In the summer of 1841, the individual now addressing the public paid a visit to some of the principal Moravian establishments on the Continent, for the purpose of satisfying himself as to the extent to which the plan of a community was followed amongst them, and the success which attended it. To proceed in the first person:—"I was anxious to obtain light upon this point, for the benefit of an association of benevolent persons who have planned a self-supporting institution, on the combination principle, in connexion with the Church of England. Having been furnished with letters of introduction by the Rev. Peter Latrobe, I first visited the settlement at Neuwied, near Coblentz, on the Rhine—a small town founded a century ago as a refuge for persecuted persons of various religious denominations, and where the Moravians are about four hundred in number. In the absence of Bishop Gambs, M. Merian, a chief director, and the inspector of the schools, conducted me over the establishment. We first visited the boys' school, which consists of a number of light airy apartments, each appropriated to a distinct class. The boys, seventy in number, sleep in one large well-ventilated room, in

which a lamp is suspended from the centre, and in which the teachers also sleep, one of whom sits up on watch all night. We then proceeded to the house occupied by the unmarried men. It is here necessary to mention that, in all the continental Moravian establishments, the unmarried men and unmarried women live in separate houses, each party by themselves, and each under the care of an elder of the appropriate sex; and the two parties have only limited opportunities of forming those acquaintances on which matrimonial unions depend. I found eighty men in this part of the establishment, all of them engaged in various employments, at which they wrought in subserviency to the general body. In one room, an individual was making up tippets and muffs, his favourite occupation. In another, one was making gloves, stocks, and boys' caps. In others were three, four, and sometimes more, making clothes, shoes, soap, candles, earthenware stoves, and other useful articles. Elsewhere, I found carpentry, cabinet-work, baking, and a large brewery. Every trade has a manager, receiving a fixed salary, and to whom money is advanced for the purchase of materials and the payment of wages. There are also shops for the sale of miscellaneous articles to the public, and a hotel for the accommodation of such as choose to resort to it. Besides the brethren of the congregation, there are servants who do not belong to it, and who receive ordinary wages. Great care is taken in selecting these persons, and every effort is made to effect their spiritual improvement. The profits arising from the trades, shops, hotel, and school, are partly devoted to the support of the church and its missions.

From the Brothers' House we went to that of the unmarried Sisters, of whom there are about a hundred. Here also was a well-conducted school for girls. The sisters not engaged in education were at work in separate rooms, from six to ten in each, making articles either for the establishment or for sale to the public. There is a room in which the latter class of articles are kept for public view. Letting of apartments to approved tenants, not of the congregation, is also a source of profit. In the Brothers' and Sisters' Houses respectively, there is a large room fitted up for public worship, with a small organ or some other musical instrument. Connected with each department, there is also a room set apart for reading when the labour of the day is done. I may here observe that the Moravians, probably from ancestral taste, are fond of music, and introduce it on some occasions when other people would think it inappropriate, as, for instance, at funerals. All amusements which usually occasion a promiscuous assemblage of the sexes—as balls, plays, and games—are forbidden.

From Neuwied I proceeded to Herrnhut, the metropolis, as I may call it, of the United Brethren. It is situated fifty miles beyond Dresden, on the southern face of a hill called Huttberg; hence its name. The population is about 1400, of whom more than two-thirds belong to the congregation. It is the place where the synods, or chief directing assemblies of the brethren, are held, and where all their missionary proceedings originate. Bishop Huffel, upon whom I first called, was too infirm to attend me; but the deficiency was supplied by Mr John F. Roderer, chief financier, a brother-in-law of Mr Latrobe, by whom I was introduced to Bishop Anders, and M. Frauerf, one of the chief directors.

Besides the trades carried on at Neuwied, I here found a large tan-yard, and manufactures in iron and brass, goldsmiths' work, and button-making; also a considerable mercantile establishment, conducted, under the firm of Abraham Durminger and Company, by three brethren, who each receive a salary. There is also a small day-school.

The business of giving lodging and hotel accommodation is carried on as at Neuwied. In the Sisters' House, I found a scale of four different prices for boarding, and a charge for lodging according to the size of the room for those who desire one exclusively. The hotel was conducted upon a respectable scale. I found in it a Livonian nobleman, of gentlemanlike deportment and well-cultivated mind, Baron Arderkas, who told me that he had lived there three years. He enlivened a few of my evenings by his tasteful performances on the piano-forte. No one, however, is allowed to lodge in the establishment at Herrnhut, not even in the hotel, without the permission of the congregation.

This may be considered as the most interesting of the Moravian establishments, as being more remote from general society, and having greater attractions and advantages than the more recent and less isolated settlements. The avenues, and the cemetry situated on a hill on the way to the observatory, which occupies a still higher eminence commanding an extensive and beautiful prospect—the house, formerly the residence of Count Zinzendorf, containing the archives of the body, and a museum of curiosities sent home by the missionaries—the extensive gardens open to the public, and an adjacent hill laid out in walks and plantations, with rustic and ornamental seats, from which delightful prospects are beheld—conspire to heighten the charms of this peaceful settlement. The musical band is here more complete than elsewhere, and occasionally the congregation is summoned to church by trumpets played from one of the upper windows of the building.

During my residence at Herrnhut, I rode over with Mr Roderer to Nisky, a settlement twenty miles off, where there is a large and well-conducted academy for boys, besides the usual establishment for the useful arts. The education is here so far advanced, that the boys may be directly transferred to the Moravian University at Guadenfeld, in Upper Silesia, where preparation for the ministry is completed.

From Herrnhut I afterwards proceeded to Kleinwelke near Bautzen, where there is a congregation of about four hundred. The same trades were carried on here as at Herrnhut, with rather more of agriculture; but the chief interest at this place was in the schools for the children of the missionaries—between forty and fifty boys, and about the same number of girls. Many were orphans, whose parents had fallen victims to the climate in which they had preached the gospel. I never saw any boarding-school in England where the children were more comfortably provided for in every respect, or appeared so happy; separate rooms were appropriated to the different classes; and here, as in all the other schools, the children sleep singly. As we visited the different classes, the good pastor Ultsh seemed to take pleasure in referring to the widely-separated parts of the globe in which the children had been born; pointing to each in succession, he said, "from Labrador," "from Africa," "from Surinam," "from Greenland," "from the West Indies," &c. At Kleinwelke, twenty-five of the brethren work at an establishment for making church bells, belonging to Mr Ghrul, who is not of the congregation.

The last settlement I had an opportunity of seeing was that of Zeist, near Utrecht, in Holland, where the number of members is about four hundred. Besides the same description of trades and manufactures as at other stations, there are seven or eight shops or rooms, in which a great variety of articles are sold, in addition to those made at the establishment, as well as two boarding-schools for boys and girls: profit is also derived from letting some of the apartments to respectable individuals not belonging to the congregation. The Rev. P. Raillard accompanied me through the sisters' house and schools, and I could not but remark the great regard and respect every where evinced towards him; and, indeed, in all the settlements, I was impressed with the idea, that the pastor or bishop at the head of the establishment appeared to be precisely that individual best qualified by his intelligence, kind feelings, and manners, for the highest office.

From what has been stated, it must be obvious that there are only some details common to all the Moravian settlements. Agreeing in the general principle of combining for the purpose of promoting their own spiritual improvement and the planting of Christianity in the uncivilised parts of the globe, all their regulations, and, as much as possible, all their temporal affairs, are made subservient to these important ends. As to the mode or degree in which this is effected, much depends upon local and other circumstances, the capabilities and probable success of the brethren in their respective trades, the wants of the neighbourhood, and how far they can meet the competition of external society. For instance, at Herrnhut there is no boarding-school, for they have there no educator equal to M. Schordan at Nisky; to which place, accordingly, many children are sent from Herrnhut. At Nisky, situated in a remote and desolate country, where few strangers are seen, two shops are scantily though sufficiently supplied; while at Zeist, in the centre of a highly civilised and populous country, and much visited, there are no less than seven or eight shops for the sale of numerous articles, besides those made on the spot.

The most striking feature in all the proceedings of the United Brethren, is the intimate connexion that subsists between religion and secular affairs; the former is never lost sight of, but, on the contrary, is constantly the governing principle, and is visible in their intercourse with each other. In all new undertakings, in all changes, or when any misunderstanding arises, a conference is called of the bishop or pastor, the wardens and managers. Hence, in every measure proposed, its bearing upon the interests of religion is the chief consideration. Thus, all that concerns the members, of whatever age, individually or collectively, commercial pursuits, amusements, schools—in short, all the transactions of life—are brought under the immediate direction and control of religion. This plan, at once simple and comprehensive, becomes easy of execution; any unforeseen counteracting influence is in general soon corrected; and, when adopted at the missionary stations, renders them more efficient, and enables the brethren to make great progress with very limited resources.

There is a German phrase signifying "prayer and labour," which seems to characterise the Moravian settlements, and singularly applicable to the brethren is the remark of Locke—that "for a man to attend to his religion and to his particular calling, is generally sufficient to take up his whole time." Habitually occupied in their several trades, they become unconscious of that monotony which is felt by a stranger—relieved, however, in some degree, by the cultivation of music. There appears to be no public library, nor much encouragement given to scientific pursuits and discoveries. These might involve expense, and prevent that concentration of mind to the one great object to which all their thoughts and energies are devoted. But I would remark, with reference to my own object, that that very omission to which the brethren may have been in some measure indebted for extraordinary success in a specific and most important branch of Christian duties, renders the Moravian settlement imperfect as the model of a Christian community embracing all the legitimate objects of human society. The study of the sciences, the practice of the arts, and the prosecution of discoveries, present an inexhaustible field for the exercise of the diversified talents of mankind, and for that enterprise and excitement which, if not called forth by purer and higher aspirations, are too often wasted upon objects useless or pernicious. * * *

[Our correspondent goes on to draw various inferences from the Moravian establishments with regard to the design of a self-supporting institution for the humbler classes in England, in connexion with the Established Church. We do not think it necessary to follow him in these, but would remark, that great caution is necessary in all imitative movements. A revolution in 1688 succeeds in England; but an imitative revolution attempted in Naples in 1823 fails. The Moravian communities, as far as they really are communities, have taken their rise under the influence of a concentrated religious zeal affecting a small body of men to the very inmost cores of their nature. They have thus had an active and powerful principle of continuous force to carry them on through all arrangements and undertakings. We can easily conceive a new association realising all the peculiar arrangements of the Moravians, and even more favourably circumstanced with regard to wealth and the countenance of great names, but which would nevertheless fail for lack of that concentrated spirit which only extraordinary circumstances and occasions can generate. Here, evidently, lies the great difference between the Moravian communities and those social establishments which Mr Owen has endeavoured to plant. The one class seem to us like a body which, having a vital principle in it, can stand of itself; the other is like a body which, wanting life, can only stand while it is held up by external means. The plan of our amiable correspondent is based on truly respectable principles, and contemplates excellent objects; but we would hope that it will not be commenced unless its supporters are sure of its having the full benefit, not only of money and good intention, but of that self-sustaining energy which so often brings success in circumstances otherwise unfavourable, and without which all common circumstances of a favourable nature are in vain.]

A BULL-FIGHT AT MADRID.

In the year 1822, while resident in Madrid, I had frequent opportunities of seeing those savage exhibitions, the bull-fights, of which the Spaniards, notwithstanding their partial regeneration, still continue to be passionately fond. For their own sake, such spectacles are not worthy of description, but they serve as records of national manners, to be contrasted with something better in our own country, and I will venture to depict one of the exhibitions at which I chose to be present.

The place of the spectacle was at the amphitheatre, situated beyond the Puerta del Sol, one of the outlets from the city. The edifice is formed of wood, of a circular form, having no roof, and seated quite round, except at the place where the bulls are kept: these seats are somewhat like pews, those for the people of the highest rank being nearest the top of the building. The place in which the bulls are kept is a cellar under ground, whence the ascent to the arena is by a dark passage, with two doors, one at the end of the passage, and the other opening on the arena; and these doors, at the entrance of the bull, are opened by men in such a manner as completely to cover their persons.

Several days before the exhibition takes place, the bulls are confined in the cellar; and during the interval, are occasionally soundly whipped, in order that they may be rendered still more ferocious than they might otherwise be. Bulls for this purpose, at Madrid, generally come from the wilds between La Sierra Morena (the Black Mountain) and La Mancha.

On the day spoken of, the king, the court, all the grandees, and their ladies, were present, so that a most favourable opportunity was afforded me of seeing whatever Madrid boasted of beauty, rank, and fashion, more especially as my seat was in the very highest row. The first *palcos* (boxes) were adorned by some of the handsomest dark-eyed ladies that could be seen in Spain, their rich *basquinas* and mantillas (a particular dress for Spanish ladies) being worn with infinite grace. An immense deal of ceremony takes place before the real business of the day commences. Exactly opposite to the door by which the bull enters, the box of the king is placed, and of course the highest is allotted for the purpose. Should the king be absent, the highest in authority, whether civil or military, takes his place. Civil officers are appointed to give orders to those having charge of the bulls. The principal magistrate, attended by two *alguazils* (inferior officers of justice), having ascertained that every thing is ready, comes forward in front of the box occupied by the authorities, and, after a formal salutation, requests leave to proceed with the entertainment. This being accorded him, he goes out of the ring, and gives the signal; immediately the two folding-doors fly open, and a bull rushes furiously into the arena; but, upon seeing the assembled multitude,

he makes a pause, and looks around, as if seeking some object on which to spend his rage. The *picadors*, attired in the ancient Spanish dress, are stationed on horseback, lance in hand, at the part of the ring which faces the bull's entrance. On this occasion an Asturian damsel was acting as a *picadora*, the only difference between her and the others consisting in this, that in place of stopping the bull with the lance, she used large darts, which she threw at him with great dexterity.

On the occasion of which I am speaking, the first bull which rushed into the arena glared with savage bewilderment, and roared prodigiously. The Asturian was the first to present herself before him, and adroitly fixing one of her darts in his shoulder, galloped round, the bull running towards her. Rapidly returning to the charge, she again planted another piece of iron in his neck; but, whilst endeavouring to treat him to a similar enlivener for the third time, the bull plunged his horns into the belly of her horse, and tossed horse and woman to a great height. They fell as if dead; and while the bull was endeavouring, amid the applause of the multitude, to put a finish to what he had so well commenced, the *banderilleros* (young men on foot, dressed in a red cloak, and armed with darts of wood, shod with iron at the one end, and having a squib at the other, which takes fire on being fixed), with their red cloaks, came to distract his attention, and gave the woman an opportunity to escape.

A general shout of "*Bueno! bueno! viva el toro!*" (Bravo! bravo! long live the bull!) was thundered in the amphitheatre, while the woman and the horse were being removed from the arena. The woman had her right leg broken.

The first attacking party being thus off the field, the next picador advanced towards the enraged animal; the bull sprung forward at him, but he was arrested by the lance; however, he returned to the charge before the horse could face about, and fixing his horns between the horse's thighs, tossed him in the air, and overthrew the rider. Instantly the banderilleros again appeared, and horse and man were removed.

A third picador offered battle to the bull, who, rushing at him, was stopped by a lance firmly planted in the shoulders; in vain did the bull try to overcome his antagonist by pressing upon him, while the steel was in his body; every effort only served to fix the lance the deeper, till at last he disentangled himself by drawing back, which, in the estimation of the Spaniards, is a very cowardly thing. They manifested their disapprobation by loud cries, and forthwith, to excite the unfortunate animal, the banderilleros threw their darts at him. The poor bull was quite mad; the same picador again stopped the beast; he was very weak from loss of blood, and therefore offered little resistance to the attack. Unable to combat, the time for the matadors to dispatch him soon came. The first *matador* (literally, murderer), holding in his left hand the *moleta* (muller), and in his right the sword, drew near him; and the very instant when the animal rushed towards him, he made his allonge, the sword being directed to the heart; the creature staggered, but was not dead. The turn of the second matador now came, and this official soon gave a blow by which the animal fell lifeless to the ground. The moment the poor creature fell at the feet of the second matador, trumpets were heard, and four mules entered to drag the carcass from the arena.

I might describe the various combats which took place with the different bulls; but as, with very little difference, one narration may serve for all, I shall confine myself to relating a ludicrous circumstance that happened in the fight with the fifth animal brought into the arena. This toro was very successful in disabling the several opponents he had to encounter. The three first picadors were all more or less injured; and of their horses, one had his legs broken, and the two others were ripped up by the enraged brute. At such excessive good fortune on the part of the bull, the applause of the Spaniards was boundless. A French drummer, sitting on the lowest bench, and who was tipsy at the time, annoyed at so many being forced to retire before the bull, leaped the barrier separating the arena from the spectators, and went staggering to set the bull at defiance. Mingled roars of laughter, and cries of "Long live the drummer!" struck upon the ear. Meantime the man advanced as well as he could, putting himself in a fencing attitude, apparently forgetful, however, that his sabre was hanging by his side.

The bull rushed towards him, and while the drummer appeared desirous of boxing his ears, he was forced, from the effects of the liquor he had taken, to measure the length of his back on the ground. The scene now became amusing in the extreme. Stretched on the sand lay the luckless drummer, moving his feet to whatever direction the bull made the attack, and making a multitude of ejaculations each time that his enemy came to an unpleasant propinquity; though the danger was more apparent than real, as, owing to his antagonist not being able to bring his horns sufficiently low to do him serious injury, he was scarcely touched. The animal, after trying to toss the recumbent drummer, contented himself with simply smelling at him; and then, seeing that nothing could be done, retreated several steps, being obliged to do so by the flashing of the red cloaks of the banderilleros, who came to succour the inebriated combatant. The drummer was quickly removed, almost unhurt, though his antagonist was not so fortunate, for, after having received several lances, he was dispatched by the unerring dagger of the matador.

What must appear to the spectator the cruelest part of this exciting spectacle, is the manner in which the poor horses are treated. Their eyes bandaged, they are subjected to the unsparing control of their riders; they are forced, even when wounded, to continue to minister to the gratification of an anxious and sanguinary crowd. No relaxation is afforded them; and till nature, entirely exhausted, refuses them strength to remain any longer standing, they are obliged to bear their part in this brutal entertainment.

No man can reflect on the character induced by the continued indulgence in these *amusements*, without attributing to their influence a considerable part of the disregard for human life always manifested by the Spaniards. The circumstance of frequently beholding the blood of the noblest animals shed without remorse, for no useful end, at last must lead to an entire contempt for the shedding of human blood. The surprise, therefore, that one at first feels on hearing of the atrocities perpetrated during the late civil war in Spain by the several factions, must disappear when one of the principal causes is assigned.

LINES ON OPENING A CASKET.

Oh! none would covet jewellery,
Or scenes where jewels shine,
If every casket's treasured hoard
Told such a tale as mine.
A bracelet—of my father's hair,
A locket—of a brother's,
A brooch—memorial of despair,
A guard-chain—of my mother's.
Rings, fans, and hearts, unfitly gay,
From friends estranged or far away;
That spotless agate cross was given
By one who now finds rest in heaven;
And long we've wept the matron staid,
Who gave yon locket's raven braid:
Memorials all, save *one* alone
Of grief, of death, of friendship flown!

Grey is the lock that bracelet bears,
But thought, not time, had made it so;
For in the strength of mind and years
Was that thrice-honour'd head laid low!

This locket's golden silky tress,
It waved once on a cherub's head,
Lent but to cherish and to bless—
Soon was its angel mission sped:
Through the stain'd crystal still appear
A sister's kiss, a mother's tear!

The auburn lock, it graced a brow
Bright in the majesty of truth;
That, too, is pillow'd lowly now,
And with it rests the dream of youth!

My mother's hair—she lives, and long,
Long may she live, loving, beloved!
But this fair chain was twined, ere wrong
Or woe her widow'd heart had proved;
And thus, even this becomes the theme
Of life's uncertainty and change—
The heartlessness of fashion's stream,
The void of miscall'd pleasure's range!

'Twere well if all vain ornament
Such grave and tender warning sent;
Then would life's giddy vanity
Be temper'd with fond memory;
And few would covet ornament
Or scenes where trinkets shine,
If every body's jewels sent
A lesson sad as mine!

L. F. C.

BENEVOLENCE OF THE MEDICAL PROFESSION.

It is a remarkable circumstance, that, without referring to more distant quarters, the cardinal points of Dublin afford striking and permanent illustrations of the philanthropy of medical men. The founders of the following hospitals, Sir Patrick Dun's on the east, Stephen's on the west, and the Rotunda on the north, were physicians; while the medical officers of the Meath Dublin County Infirmary on the south, voluntarily transferred their salaries to the funds of the hospital. Doctor Lentaigne was so liberal of his professional services, that he was named "the poor man's doctor;" he was contented with whatever fee his patients could afford to give. Once a-week he gave a most comfortable, nay, elegant dinner, at which he presided, to a crowd of reduced gentlemen. Doctor Percival, not to speak of his uniform benevolence and high-mindedness, gave all the fees he had received on Sundays in charity. May I ask if there be any one here that has been idle and thoughtless, and thinks that he cannot retrieve lost time and neglected opportunities? Do I address another that may be disheartened by poverty at home? Do I recognise a third, conscious and justly convinced of the possession of high mental powers, and who is not prepared to make a successful struggle for fame and fortune—prepared, I say, to rise above his fellow-men, and exact the homage due to superior intellect and genius? If there be any such amongst us, let him lend an attentive ear to this hasty sketch of a great and good man. The biographer of the late lamented Cheyne of this city states—"While he (Dr Cheyne) was assistant-surgeon and surgeon in the artillery, from 1795 to 1799, his time was spent in shooting, playing billiards, reading such books as the circulating library supplied, and in complete dissipation." Thus were spent these four years of the life of a great man. But the sun then rose on the soul of Cheyne. "He determined to become once more a medical student, and spent nine additional years in the study of pathology and the practice of medicine, by patient observation, reading, and the experience of the best living authorities." After such preparation, did this physician, a candidate for professional distinction and professional success, require that his innate talents, his hard-earned knowledge, his worldly tact, should be bolstered up by the aid of riches to procure the eminence he aimed at? No. Cheyne was the architect of his own fortune. "In 1809 he settled in Dublin, neither expecting nor indeed wishing for rapid advancement. What is easily acquired is little valued, and often soon lost. He had a few friends, who were much dissatisfied with his apparent apathy, and the obscurity in which he lived. During the first six months of his sojourn in Dublin, he made only three guineas. In 1816, Cheyne's practice yielded him L.1710; in 1820, and for ten successive years, it was L.5000." Did Dr Cheyne feel now that fame was happiness, that eminence was happiness, that riches are happiness? Was he not ready to acknowledge, with Young, that "the wish accomplished is the grave of bliss?"—*Hayden's Physiology.*

[We cordially coincide in the foregoing observations on the benevolence of the medical profession, the members of which, as far as our knowledge goes in Edinburgh, are decidedly the most benevolent portion of the community. Their cheerful and gratuitous attendance on the destitute poor, their labours at hospitals and dispensaries, and the intrepid manner in which in many cases they incur great personal danger from contagion, without the hope of reward, all merit the highest meed of public approbation.]

AMERICAN MANNERS.

I had long heard of the impertinent curiosity, rudeness, vulgarity, and selfishness of the people of the States; but, instead of any extraordinary signs of these repulsive qualities, I found good breeding, politeness, frank hospitality, and very generous feeling, prevailing amongst them, in as great a degree and with as few exceptions as at home. In the cities I saw none of the open displays of depravity which disfigure our large towns; and in all my journeying I never saw the face of a policeman—never met a beggar or any one in the garb of mendicity—never heard uttered an oath or imprecation—and never witnessed an instance of intoxication but one. * * I observed, when at Albany, that the Americans are attentive to their religious duties, and this opinion has been confirmed by a further acquaintance with them. One does not meet here with any pretension to the *high fashion* bred in courts and pervading their atmospheres; but exclude this from the comparison, and, between the States and England, there will be found, in private society, such a resemblance of manners, as for the moment makes a Briton forget he is not in his own country; or if that shall be called to his mind, it will probably be by a difference only in the personal appearance in the natives of the two countries.—*Captain Barclay's Tour.*

EXALTATION OF CRIMINALS.

The sympathy lavished by misdirected benevolence on persons convicted of hideous crimes, who, if they had remained in virtuous poverty, would have excited no sort of attention, is one of the most odious things which we are called on to notice. A correspondent of the *Times*, styling himself "No Pharisee," thus feelingly and sensibly treats of the subject:—"It appears that, in most instances, criminals are better fed and lodged in prisons than the honest and well-disposed poor in the union workhouses. The police reports almost daily show that the poor have begun to appreciate the difference; and now, if a pauper wishes to be better fed and lodged and cared for than he would be in the workhouse, he forthwith commits some offence to entitle him to the indulgences to be obtained by crime. The perverted taste and spurious sentiment which divert that commiseration and sympathy to criminals, which would find ample room for their exercise among the well-disposed and industrious, but unfortunate, are calculated to produce the worst results; and it has become a serious inquiry to ascertain whether these causes have not had considerable influence in increasing the amount of crime in this country. If a vicious girl, precocious in crime, attempts to set fire to the dwelling in which she has been provided with a good home through charity, when brought for examination, she is surrounded by a crowd of well-dressed tender-hearted dames, who are quite shocked that so interesting an object should be thought worthy of punishment, and urgently solicit her release. If a ruffian should commit a crime so atrocious that it degrades our national character, and strikes with horror the feelings of the right-thinking portion of society, it happens, when he is brought to justice, that the public expect daily reports in the papers of the day of how he ate and how he slept, what he drank, and what he said. Persons from every class of society solicit the distinction of being admitted to his levee. Pious but weak-minded ministers of religion hold him forth as one of the chosen among the elect; and when, finally, he is brought to undergo his just punishment, one of the principal officers of the great metropolis of the empire, robed and furred with all the decorations of his office, mounts on the scaffold for the purpose of shaking hands with the wretch who has polluted society with his crimes. He passes from the world with more honour and commiseration than ever attended the most worthy among the Christian martyrs. If depraved taste leads certain persons to feel that sympathy with crime, and seek their saints in jails, let them, if they will, canonise their bones—let them enact pilgrimages to the shrines of Saint James Greenacre and Saint Francis Courvoisier, but let them not so control the character and feelings of society as to cause the poor to be treated as criminals, and criminals as martyrs."

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row.

Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

LITERARY REVOLUTIONS.

THE student of English literary history is familiar with the fact, that every successive age has been distinguished by the development of some species of literature distinct in its character from those which delighted the public in the preceding and subsequent ages. In our own time we have seen the rise, progress, and decay of the historical novel; for although that species of composition was not wholly unknown before the days of Sir Walter Scott, it was not extensively popular, nor was it cultivated by men of enlarged understandings and extensive acquirements. The novelists of an earlier period were, indeed, in the habit of introducing historical characters as part of their machinery; but to make the interest of the fiction mainly dependent on the historical truth with which these characters were depicted, was no part of their plan. This—the grand secret of success in the modern historical novel—they never attempted: they trusted for the most part to the general accuracy with which they delineated human character, and to the variety and liveliness of their incidents. The great writer we have named may fairly claim the credit of having created a new school of composition, and one which acquired popularity more speedily and extensively than could well have been anticipated. Whilst, however, his own productions and those of some of his followers are not likely soon to forfeit their present position amongst the treasures of English literature, it is scarcely probable that any new attempt in the same field would meet with very distinguished success. The day for the historical novel has passed.

Earlier than these there was the Romance School, with its apparatus of beleaguered castles, distressed damsels, gallant knights, haunted chambers with all the horrors of enchantment and diablerie. These had their charms for a time; but with the time these charms departed, and the productions of the romance school are now consigned to the shelves of the circulating library in the obscure village or distant borough town.

Then there was the school of fashionable novels; and this, too, has had its day. It was not a very long one, but one quite long enough, although we are far from thinking it one without its utility. "I remember," says Schlegel, "it was the observation of a great philosopher, that the moment the world should see a perfect police, the moment there should be no contraband trade, and the traveller's pass should contain an exact portrait of its bearer, that moment would it become impossible to write a good romance, for then nothing would occur in real life which might with any moderate degree of ornament be formed into the groundwork of such a fiction." Did the "great philosopher," then, never read a fashionable novel where the interest is such as no perfection of police or revenue establishments could ever destroy—where speculative mothers, persecuted daughters, wealthy baronets, and unhappy younger sons, figure as characters, and where the scene is laid not in umbrageous forests, but in courtly drawing-rooms—not in the robber-haunted paths of Abruzzi, but in the perfumed regions of Mayfair? Writings of this description were for a time eagerly read; for just as men covet to know something about those countries where savage jealousy prohibits civilised intercourse—just as China and Japan are to this day the objects of anxious curiosity—so did men wish to learn something of the customs and habits of people whose wealth and position had elevated them out of the range of vulgar observation. But this was a curiosity that was soon satisfied; lords and ladies were found out to differ but little from other people, and the fashionable novel has taken its place in the obituary of literature.

Modern times have also witnessed the rise and fall of another school of a very different kind; and this, with every admiration of its originator's powers, we take leave to designate the "Byronic." Lord Byron said, "that he awoke one morning and found himself famous." And one morning afterwards, divers young gentlemen, his countrymen, awoke and found themselves miserable. Then did the press groan with poetical sighs and cantos of lamentations, and the gorgeous descriptions of the noble pilgrim were iterated and reiterated till Cadiz and the Acropolis, the Piræus and "Scio's rocky isle," became familiar in men's mouths as household words. Then sprung into literary existence enough of bandits and pirates, each of whom "knew himself a villain," to have stocked every prison and plundered every bank in Europe. The world became out of conceit with the world, and sleek darlings of fortune took to railing against their nurse in good set phrase. This humour has passed away, and the Byronic school has become a thing of yesterday.

The most remarkable of all changes is the falling off, if not abandonment, of dramatic literature. It had its day, and is gone. Social progress now requires other instruments. Before literature became so generally cultivated as it has of late been, the stage was the *chief* instrument of education, and no other could have been found more adapted for a people which was not a reading people. This was the case amongst the Greeks, and then it was that the drama achieved its loftiest triumphs, for then was it the medium through which educated mind spoke to the whole body of the people, as now it speaks through the printing press. In the middle ages books were scarce, and reading an art of rare and difficult acquisition; and we know that the clergy—the sole public instructors—made theatrical representations the vehicle for diffusing the principles of religion and the precepts of morality amongst the unlettered people. Nay, theatrical representations, from the purposes for which they were used then, received the emphatic name of "Moralities." And even in subsequent times, when reading was confined to the wealthier classes, the theatre was still the channel of intercourse between great minds and the bulk of the people. If, then, we are surprised at the decline of the drama, we must remember, that, since the halcyon days of dramatic excellence, times have changed, and the men who would have written plays of yore now write books, and secure thereby an audience more numerous, and more capable of appreciating literary excellence.

When we go back into the earlier ages of English literature, we find other extinct modes or styles—as, for example, the character-depicting of the early part of the seventeenth century. This consisted in taking some section of society, or profession, or occupation, and giving the whole of its characteristic features under an impersonation, thus, as it were, making an individual the representative of his class. Sir Thomas Overbury was one of the earliest cultivators of this mode; and Earle, Bishop of Salisbury, one of the latest. With much antithetical quaintness of expression, they produced many able sketches; but we find in almost all of them a disposition to condemn large sections of men on account of their pursuits, or other circumstances over which they could scarcely have had any control—a species of prejudice which has survived the period. The physician has been a favourite point for the satirist's weapons, from the days of Horace downwards, and an alderman has always been considered fair game. Shakspeare himself, with all reverence be it spoken, never brings a mayor on the stage but to make him ridiculous; but, despite the jest, we must remember that Dante was Mayor of Florence, and that Montaigne—the learned, tender, lively Montaigne, who has instructed and delighted thousands—served a municipal office at Bordeaux. Dr Earle is not superior to vulgar prejudice, and he does not forget to make his alderman as an alderman *ought* to be—*fat*. But he depicts him as something worse than fat. "A ponderous man he is and substantial, for his weight commonly is extraordinary." "He is a rigorous magistrate in his ward," we are told, "yet his scale of justice is suspected, lest it be like the balances in his warehouse." The parvenu, or "gentleman of no ancient gentility," has also usually been a favourite butt of the wits; and we can readily see, in the frequency and bitterness of their ridicule, how rapidly the increase of commercial wealth at this period was raising the condition of the middle classes of society. A revolution of such a kind could not have been otherwise than distasteful to those to whose level they were raised. "The upstart country knight," whom Bishop Earle satirises, was doubtlessly unpopular in his time. His father is described as "a man of good stock, though but a tanner or usurer; he purchased the land, and his son the title. He has doffed off the name of a country fellow, but the look not so easy, and his face still bears a relish of churn milk. A hawk he esteems the true burden of nobility, and is exceeding ambitious to seem delighted in the sport and have his fist gloved with his jesses." There is something *cocknified* in the bishop's conception of "a plain country fellow," who, he would have us to believe, possesses a mind not much distracted by objects of real moment; "but if a good fat cow come in his way, stands dumb and astonished, and, tho' his haste be never so great, will fix here a half an hour's contemplation. He thinks nothing to be vices but pride and ill-husbandry, from which he will gravely dissuade the youth, and has some thrifty hobnail proverbs to clout his discourse." To the bishop, citizens, shopkeepers, and bakers, are peculiar objects of aversion. The first has for "his cheapest guest a customer, which is the greatest relation he acknowledges, especially if you be an honest gentleman—that is, trust him to cozen you enough." The second "tells you lies by rote and not minding, as the phrase to sell in, and the language he spent most of his years to learn." The unfortunate baker "abhors works of charity, and thinks his bread cast away when it is given to the poor." The attorney, as might be supposed, meets but little mercy at the hands of this severe satirist. "Strife and wrangling have made him rich, and he is thankful to his benefactor, and nourishes it. His business gives him not leave to think of his conscience; and when the time or term of his life is going out, for doomsday he is secure, for he hopes he has a trick to reverse judgment." The character-depicting style was not always satirical. It is Overbury, we think, who gives a picture of "The Happy Milkmaid," one of the sweetest essences that ever poet distilled from the crude mass of actual life.

A style of poetry flourished in the time of Charles I., which no subsequent age has seen revived. It consisted in short, hard-favoured pieces of verse, on religious subjects, generally on those which there is least pleasure in contemplating. It gave the most unamiable views of human nature, and was eager to remind the reader of the shortness of his days, and the sad state his body was sure to come to in the grave. The poor little vanities in which man indulges on earth, and without which, apparently, his career would be unmitigated misery and toil, were

especial marks for this kind of poetry, to which we may give the epithet of the cross-bones and death's-head style. The sight of a well-dressed lady threw one of this order of poets into a fit of melancholy, in which he would be sure to compose some stanzas on the figure of an hour-glass, showing how shockingly mouldy our fine dame would be a hundred years hence. A pompous procession, a royal marriage, a coronation, or any other fine affair which usually sets common mortals a-huzzaing, only caused our sepulchral bard to fall a-writing epitaphs for the principal parties concerned. Even the innocent sports of childhood supplied him with food for his morbid musings. Of this style Quarles was the principal cultivator; and it must be owned, notwithstanding what Pope has said of him, and all our horror of his charnel-house imagery, that he was no mean poet. Nevertheless, the spade-and-mattock literature lived, if it ever could be said to *live*, only for its day.

In the same age, and a little before it, flourished the allegorical style of poetry, zenithed amidst a blaze of intellectual glory by Spenser. A cunning plan was this allegorical mode of writing, far outvying in that respect all the Philosophy-in-Sport-made-Science-in-Earnests of the present age. A young lady sat down to read what she thought a long romantic poem respecting a red-cross knight. The hero was handsome and engaging; the adventures sufficiently strange, and all that kind of thing. How she must have been surprised at last to learn that she had all the time been perusing a theological treatise! She turned to the adventures of another knight, who encounters every sort of danger, suffers long captivity, and at last is brought out to be tormented and put to death. It must have appeared rather odd to be told, after all, that this gentleman was the virtue called Fortitude. She would read, with a feeling of dreamy enchantment, a description of a scene beautiful beyond all imagination—how startling it must have been to learn that this was only a curious way of describing a temptation presented to the morals of one of these chivalric abstractions! And Edmund Spenser wrote many volumes of his fine-sounding stanzas in this manner—all being substantial and personal to appearance, but bodiless and abstract in reality. "The Purple Island" of Phineas Fletcher is a long and elaborate poem of this kind. At first sight, it seems a very pleasant piece of topography done into rhyme, but by and by we find that the real subject is the human body. This style enjoyed a protracted existence in prose, and gave rise to *one* work of that nature still charming—"The Pilgrim's Progress." The Essayists also made some use of it; we must all remember such openings of papers in the Adventurer and Rambler, as "Pity was the daughter of Love and Sorrow." There must have been something which was felt to be beautiful in this style, or it would not have enjoyed so much popularity; and, indeed, there are some specimens of it which must ever live in our literature. Yet, strange to say, no writer for an age or more has thought of composing in this manner. The virtues are now spoken of in their simple ostensible characters, and the human body is described by Drs Combe and Southwood Smith without any poetical bo-peep about the matter.

When we step farther back in the annals of English literature, we find various modes long since deceased; for instance, the device of relating half-satirical matters under the similitude of a dream, practised by Buckhurst in his "Mirror for Magistrates," the Scottish Lyndsay, and even so early a man as Robert Langlands in his "Piers Ploughman," Dante being probably the first setter of the fashion to our countrymen. For one whole age in the Plantagenet times, there was scarcely any thing but rhymed histories; a little before, there was nothing but metrical romances. And all these works were written each after a particular manner, which, in the main, was sustained as long as the fashion of that kind of literature existed.

Though there are certainly instances of something like a slight revival of a particular style of literature, generally under the influence of some man of talent who has chosen to throw his mind into that form, it is almost a rule that a style has only its day—just as the Elizabethan dress may be sometimes resuscitated at a fancy ball, and for a night admired, but yet has no chance of coming again into fashion amongst the public. It is difficult to account for this; for if all the readers of a particular period have seen beauty and found enjoyment in any particular kind of literature, why should not the readers of another period, seeing that the human mind remains essentially the same, be liable to similar experiences? Perhaps there are two things which contribute in a considerable measure to the phenomenon—difference of conditions in different ages, and the mere fancy or caprice which obviously is what creates fashion in dress. Thus, an age may require the drama, because its moral feelings can only be addressed through the medium of the living scene; and poets may find it necessary, for very grave reasons, to give advice and reproof on political matters under cover of a dream. Fashion acts more widely. Originally struck out, perhaps, by a first-rate intellect, a mode acquires favour with the public: the next class of intellects imitate; and the public likes the first and best specimens so much, that it readily patronises the secondary and the mediocre. It thus becomes the predominating literary feature of the time—in short, the fashion. At length, it is so burlesqued by the last and weakest class of writers, and its whole soul and spirit is so worn out and exhausted, that a disgust arises, and neither men, women, nor children, will listen any more. The next great wit carries away the public mind in a new direction, and the old style is thenceforth only sufficiently remembered to ensure that, when any one twangs a single string of its lyre, he is instantly proclaimed an imitator of a fashion gone by.

THE GOVERNESS.

BY MRS S. C. HALL.

PART THIRD.

THE next morning the pat, pat, pat, of Mr Byfield's cane was heard ascending the steps leading to Mr Hylier's hall door; his knock had the determined sound of "I will come in." "Remember, James," said his mistress, "popping" her head out of the breakfast-room, "I am not at home—I shall not be home all day—I am out for a week—went down to meet your master last night." James bowed, and the lady disappeared.

"My mistress is not at home, sir," observed the sapient footman. Mr Byfield poked him aside with his cane, and having entered the hall, said, "I want to speak to Miss Dawson."

"Miss Dawson, sir, left the house last night."

"Left last night! Then where is she gone to?"

"I really can't say, sir; she's left for good, trunk and all."

"Left—gone; but surely you must know where she drove to?"

"The housemaid saw her off, sir." Mr Byfield commanded Mary to appear; but she, having always lived "in the best families," lied with superior firmness. "The very words Miss Dawson said, sir, were, 'Tell the cab to drive to Oxford Street, and then I will direct him the number;' these were her last words, sir, and I can tell no more." Mary was in haste—not agitated by the untruth—so she stayed no farther question, but dived down the kitchen stairs.

"Now," said the old gentleman, "I *must* see your mistress."

"Not at home, sir," repeated James.

"When will she be at home?"

"Not for a week. She's gone down to where master's stopping."

"That's the third falsehood you have told since I entered this house, young man," observed Mr Byfield. "Your mistress cannot have gone down to where your master is, because business obliged your master to come to my house this morning, even before he visited his own;" and Mr Byfield turned and entered the breakfast-room so suddenly as almost to knock down the fair mistress of the mansion, who certainly was as close to the door as if she had been about to open it for her unwelcome intruder.

"Good morning, madam!" he said, with the exceeding courtesy of an angry man, before the storm that has gathered, breaks. "Good morning. Will you have the kindness to tell me *where* Miss Dawson is gone, and *why* she is gone?"

Mrs Hylier suffered Mr Byfield to repeat his question before she answered; she was debating within herself whether she should assume the tone of indignant and outraged propriety, or that of a gentle upbraiding; her temper triumphed, and she lost sight of her husband's interests and her husband's wishes. In loud and unqualified terms she upbraided Mr Byfield with what she termed his sinful duplicity, in forcing a person, whom she called by no gentle name, into her house; exhausted a dictionary of epithets upon Miss Dawson—talked wildly and at random of depravity—and wound all up by a movement something between an hysteric and a faint. Mr Byfield sat—his great grey eyes dilating and contracting, like those of a cat in the sunshine, according as his passions were moved; and notwithstanding his age, such was their fire, that they would have scorched the noisy fragile thing—who had sunk into her luxurious chair, a trembling heap of mull-muslin and English blonde—if she had had the moral courage once to look him fairly and bravely in the face. There sat Mr Byfield, white and motionless—so white, that the flakes of his snowy hair could hardly be distinguished from his cheek; his eyes flashing, as I have said; his long bony fingers grasping either knee, and grasping it so tightly, that the dark veins stood out like purple ridges on his hands.

"Ring the bell!" she said, at last perceiving that he took no more notice of her sobs than he had done of her words. "Ririg the bell!" He neither spoke nor moved; and at last the lady essayed to do it herself. He seized her arm—and Lord Lyndsay's mailed glove did not press more deeply into the soft arm of Mary of Scotland, than the old man's animated bones did into the wrist of Mrs Hylier. She screamed with spleen and pain, but resumed her seat. And there he continued to sit opposite to her, without trusting himself to speak, yet, by his presence, effectually preventing her moving. Suddenly Mr Hylier's well-known knock resounded through the house. There was a rush of light young feet—the echoes of the beatings of anxious hearts—and exclamations of "Oh, papa!"—"Dear papa!"—and a whisper or two, and then Mr Hylier came in, just in time to catch his wife, in another faint, upon his arm. Questions followed; and the two young ladies were turned out of the room; while Mrs Hylier sobbed and moaned, and called herself an ill-used woman. And at last the old man, gathering up his energies, girded himself and spoke. He stated fairly and plainly, in agitated tones, that he had placed Miss Dawson with Mrs Hylier, because he wished to observe how she would bear the ill and careless manner in which he knew she would be treated. It was (he said) of paramount importance to him that he should observe how she bore up against the disagreeableness of her situation; it had not (he continued) escaped him, that, as long as the impression remained upon Mrs Hylier's mind, that it would *please him* to be kind to his protegée, she was tolerably considerate; but when she found that he neglected her altogether—the circumstance that would have drawn a noble mind to be more gracious to one so utterly deserted by the world—rendered Mrs Hylier careless and unfeeling. Mr Byfield had his own way of doing every thing; and there is little doubt, from his own statement, that he would have gone on, heaping mystery on mystery, had he not been suddenly aroused to a sense of Miss Dawson's uncomplaining illness, by her appearance in the park; and, after much mental deliberation, he determined—still after his own strange fashion—to provide her a quiet home, and be himself the bearer of his reasons to Mrs Hylier.

"I thought," he said, "that fertile as you and your friend Mrs Ryal are in attributing impurity to pure motives, you would hardly have *dared* to pin a slander upon these white hairs, or supposed that so single-minded and self-sacrificing a creature as Miss Dawson would rush into vice—and such vice! I imagined, indeed, that you would have considered me her father; but to have thought and acted as you have done—to have turned her pennyless"——

"I did not!" screamed Mrs Hylier; "I gave her a month's salary—I—I"—— and then she appealed to Mr Hylier, to know *why he* suffered her to be insulted; and, losing all command of herself, reiterated her opinion of Mr Byfield's conduct.

"For shame," said her husband. "Mr Byfield, I intreat you to consider how Mrs Hylier has been acted upon by the misrepresentation of Mrs Ryal. She does not think her own thoughts, or speak her own words."

"I do!" repeated the foolish woman. "If it is not as I say—what connexion is he of Miss Dawson's?"

"HER GRANDFATHER!" answered the old man. "And had I not believed that I could place no dependence upon a character that had not been steeped to the lips in the bitter waters of the world's strife, I ought to be ashamed to own it. Why, then, should I feel such bitterness towards you—poor *thing* of a whirling world! You!—upon whom she had no claim; but *that* is false. Madam, there are women in the world who acknowledge the claim of sisterhood, even when it is covered by the rags of shame; who seek to save—whose hands are filled to overflowing by the charity which God pours into their hearts; whose means, however small, like the widow's cruise, increase by giving; whose names will ascend and form part of the glory of the everlasting heavens, when ours will leave no record save upon the cold and lying tombstone! Oh, my God! my God! why do you not soften our hearts before it is too late!"

Mrs Hylier would have essayed, if she dared, to say that she did not believe he was Emily's grandfather, but she could not; and Mr Hylier, while the old man paced the room violently, and wrung his hands, whispered her he had but that morning returned from the neighbourhood where her mother died, and where her extraordinary and unceasing efforts for the support of that dear mother, particularly during the last years of her life, were talked of amongst a domestic and parent-loving people, as something so enduring, so patient, so gentle, so holy, as to be quite wonderful. "And this is the creature," he added, "that the gossip of a chattering neighbourhood, eager to pick up the crumbs of court or any news, prompted you to insult. I felt honoured by my friend's desire that I should investigate for myself, and all I can say is, that if I had had the slightest knowledge of her high qualities, she should never have been treated as she has been."

"A lesson!—a lesson!" said the old man, in a voice hoarse with an emotion he used every exertion to control—"A lesson to us all, Hylier. But now to find my—yes, my child—the child of my daughter, to tell her who I am." He again paced the room, pressing his hands together, and almost convulsed.

"May I hope, sir"—— stammered Mrs Hylier.

"Hope nothing, madam," he interrupted, "as I do, but that time may be given *you*, as well as *me*, to render justice."

And now, if the tale were to end, as made-up stories do, with a record that the old man found his grandchild much better than he had anticipated; that they lived for a short time happily together, and then the governess was married to a great lord, to the discomfiture of all gossips, I should substitute fiction for fact—which I cannot do. The life of a young woman, devoted to the instruction of youth, may be likened to those streams we read of—springing up we know not where—which murmur along, fertilising as they flow; and then, after trees, and flowers, and sightly plants, have sprung up through their unhonoured influence—behold! they have disappeared into the bowels of the earth, and are seen no more! In society, we constantly meet young and accomplished ladies; their acquirements are universally acknowledged and admired; until they "came out," they

were attended to always in their hours of study, of illness, of amusement, by their "governess." She is gone now; no one ever inquires after her. She is gone, if young enough, to another situation, again to attend upon young ladies in their hours of study, amusement, and illness—again to be dismissed—again forgotten. I think it is a high privilege to be intrusted with the education of youth—one of the very highest that a woman can enjoy; but if she perform her duty, her services should *never be slighted or forgotten*. The "teacher" should rank, after her own immediate family, in the pupil's affections; or, if that cannot be (for we can all respect many whom we do not love), in her esteem; she should always be honoured, and never permitted to want; her importance to society is as vital as the unseen sap to the blooming tree; her situation subordinate, her influence paramount—not in the usual course of influences; but if we look back to our own young days, we shall remember how much of what we learnt from some patient teacher has directed us through life. My astonishment has often been excited, not by the little which governesses know, but by their knowing so much. Nevertheless, until some decided step is taken by the legislature to regulate not only schools, but the education of teachers, there must always be a chance of their incompetency to perform at least a portion of all that is required of them. Still, in nine cases out of ten, what has been done for ourselves in the way of education, has been done by this hardly-used race. And certainly Mr Byfield ought to have been satisfied with what Emily Dawson had already accomplished, without turning her over to one whom he knew would try her to the uttermost. His feelings were hardened, and he was rendered suspicious—by the past circumstances of a varied life—of there being any good in human nature; his benevolence was often frozen over; but when it thawed, the verdure of a generous nature came quickly forth.

The first step he found it necessary to take was to find where Miss Dawson was; but here he was baffled. The housemaid had received warning from her mistress the previous night, in consequence, she said, of her attention to "the governess;" and a few moments after Mr Byfield had spoken to her, had gone, as Mrs Hylier had commanded she should. The other servants pretended to be, or were ignorant, of her residence; and such was her firmness of manner in the falsehood, that Mr Byfield believed she had told him the truth. The natural impetuosity of his character was now directed to find her out; and fancying she had gone to her old friends, he posted off, leaving a wonderful story to the good people of Kensington, which was told in at least twenty different ways, the *last* being the most extraordinary.

While all was agitation and confusion in her former home—while Mrs Hylier reproached Mrs Ryal, and Mrs Ryal continued to assert that, despite all, she knew she was right—while Mrs Gresham's soft heart yielded in all the weak lovingness of its nature to the conviction that Emily Dawson was a "wonder among governesses," and Miss Colette Mercier divided her feelings as equally as possible between "chere Emily," her new parasol, her chere maman, and a certain leaning towards a gentleman who always wore "such sweet kid gloves"—while the servants regretted they had not been more civil, and the visiters that they had not been more polite—Emily Dawson, overpowered by the weight of an illness she had so long borne up against, was lying utterly incapable of sustained thought or action in the small back room of a tiny house at Chelsea. Mary's arrival was a great consolation to her. She sat by her bedside "mending up her things," and "quilling her caps," as a preparatory step to her "looking for a new place." Emily would have been glad had she talked less; but as she never expected an answer, and chatted in a low, sleepy, rippling tone of voice, it did not disturb her much. She spoke in what she considered would be the most consoling manner, showing how much better off Emily was "than many a poor lady governess she knew long ago." She told of one who, having lost her health, died in a workhouse, and no one ever looked after her; of another, who was the only comfort and support of a blind father, who would sit holding her hands in his, running his fingers over the arm worn to a shadow, listening for the doctor's tread, and turning his sightless eyes to his face, as if trying to read an opinion it gave the good doctor pain to pronounce. And then, how she did pray that God would take her father first; but the prayer was not heard, for she died, and every morning the father crawled to the churchyard. The little children would frequently go out of their way to lead him to his daughter's grave; and at last he died upon it, without a complaint; and the coroner returned a verdict—"Died by the visitation of God;" but she knew it was by the visitation of famine. "Another young person" passed them by every morning; there, that was her walk, she knew it by the halting, as she was lame, though for all that, she got over many a mile in a week. She had a turn for languages, and taught a great many at a shilling a-lesson, and had constant employment; and one sister instructed in music, and another in dancing. They worked very hard, and did not earn much, but they lived happy with one another, and liked it better than going out for good, though Miss Fanny (the dancer) was fearful she couldn't teach this last winter, from a wheezing she caught from damp feet, as she could not afford to ride. Indeed, Mary declared, in her time she had seen much misery under a thin silk gown; poor ladies were obliged to seem rich, for if they did not dress "respectable," no one would have them, though they hardly paid them enough to earn salt. Miss Dawson was happy, compared to many she knew. It was a pity that tradesmen did not keep their daughters to the shop instead of giving them notions above one thing and below another. Making them governesses half times, was little better than making them slaves. Miss Dawson ought to bless her stars; for as soon as her cold wore away, she'd be sure of a good situation.

And she would have talked thus much longer, had not her mother called her out to inquire, if she knew "what property the 'poor lady' had," as a doctor ought to see her; and Mary, good-natured girl, spurned at the question, yet coincided in the opinion, saying she was no expense to them, for she had neither ate nor drank; and if she had, she had wherewith to pay—it may be remembered that Mary did not particularly adhere to truth—and that the doctor had better come at once; she would go and fetch him—and so she did; and when he heard her cough, and saw the flush upon her cheek, and her hair moist with the dews of that English disease to which thousands are sacrificed, he blistered her chest to relieve her breathing, ordered a light diet, and particularly recommended Italy, the south of France, or Madeira; and that to a governess, with three pounds five and sixpence in her purse, and no friend!

"Oh, I shall be soon better, sir," she said—"very soon. I have been much worse; a few days' rest and quiet will quite set me up."

"Send to her friends," said the doctor to Mary.

"Lord, sir!" replied Mary, opening her eyes, "*sure she's only a governess!*"

Let any one recall the sick-bed of a beloved object suffering from hectic fever; how wearing that everlasting cough, which only ceases, to begin again; how sad, after you have drawn the curtain, softened the night-lamp, and given the composing draught, with an earnest prayer to Almighty God that the patient may enjoy sleep, how sad still to hear the hack, hack, of that gasping chest breaking up the false repose, and then to know, by the movement and the sigh, that the poor patient has turned; and though the pillows are down, and the sheets cambric, and though thoughts and hands of tenderest love have smoothed them, and poured out the most soothing and reviving perfumes—that still, though there is little positive pain, there is no rest—and you are called;—that sweet silver voice steals its melodious way from your ear to your heart; the church clock has struck two, and the watchers' eyes are heavy, but the eyes of the watched are bright; and she will have you open the curtain, and she talks of things to come in this world—of the spring time and the summer, and of when she shall be better, and of how pleasantly the autumn will pass at the sea-side; the summer will fly quite away with her cough, and then she shall so enjoy the autumn! And while she talks, her thin pure face and glorious brow, round which the damp hair clings, rest on your bosom, and you know that it is now December; but that autumn, summer, spring, will never be gladdened by that hopeful voice! Nothing can bring her back the ease of body which the poor cat enjoys before the fire; tended, as she is, by the watchful love of a whole house, she knows not rest. How much more must the governess have suffered in that small room, upon a hard bed, shaken by kindly but rough hands, believing that if God prolonged the life which, despite our sufferings, we all cling to, it would be ended—where? Alas! *no hospital will open its doors to consumption;* the lagging, certain, wearing, wasting, complaint, engendered by our shivering atmosphere, of which so many hundreds, *especially governesses*, perish, finds no public friend in charitable England.* But it was not only the wretched, unrelieved, weariness and pain of body that Emily suffered from; it was, that she had been hooted forth characterless; she, the pure, high-minded, upright, honourable girl, trembled lest she was sinking into her grave tainted; that she would meet her mother with the mark of shame, which passeth not away, upon her brow. The notion haunted her; the thought of it would not let her sleep by night or by day; she said in the morning she would be better by the evening, and in the evening she would certainly be better in the morning; for she was of a hopeful spirit; and her disease—slow, pallid, traitor that it is—encouraged hope. Several days elapsed, and her little money, despite Mary's exertions, was nearly gone. With the high-toned generosity of a noble mind, she would not write to her friend of her distress, for she knew she had not the means to relieve her, and why should she make her unhappy. She did write, though a little every day, resolving to send the letter off *when she was better*. The doctor saw she grew rapidly worse, more rapidly than usual, for her mind was goading the disease to double speed; her money was gone, though Mary stoutly said it was not, and showed her silver, which the girl had pledged her own Sunday-shawl to obtain.

In the mean time, Mr Byfield was driven almost to madness. What would he not have given to have had the power of recalling his former harshness?—how he deprecated the bitterness which made him change even his name, that his child might never hear of him! how cruel did he deem what a little time before he would have called his consistency! how did he mingle tears with his morning and evening prayers, and in positive agony call upon his wife to forgive him his unforgiveness towards his child! He found no trace of his grandaughter in her native place, and in London he was bewildered by the difficulties and negatives he experienced every where.

Mary had only been a few weeks in her place, and had covered her retreat with what she considered admirable skill. The abruptness and violence of Mr Byfield's manner defeated his own inquiries; but fortunately, Mrs Gresham, who had taken from the first a warm interest in Emily, was more successful. She made inquires with a woman's tact, and at last communicated the good news, that she had traced Miss Dawson to Mary's house. The old man intreated her to accompany him there, and she consented. Mary's mother had become very discontented at her lodger's poverty, and mother and daughter were in loud altercation on the subject, when Mr Byfield, unable to restrain his impatience, thundered so loudly at the door, as to bring all the inhabitants of the street to their windows.

"I tell you, sir, I know nothing about her. How should I?" exclaimed Mary to Mr Byfield, who could only get his stick through the open door, for she held it close with a considerable share of strength. "It's no use your coming in; she's not here; and if she was, what is it to you, you old sinner?"

"I tell you," said Mr Byfield, "she is my grandchild. God help me!" muttered the old man, as he leant against the door-post; "God help me! that rough girl guards her honour more carefully than I did."

"That's impossible!" answered Mary. "If you was her grandfather, you'd never have sent her governessing to Mrs Hylier, I know."

"I am here, Mary," said the gentle voice of Mrs Gresham; "and it is quite true that Miss Dawson is Mr Byfield's grandaughter."

Mary opened the door with what, in the poor, is deemed "impertinence," in the rich "self-possession," as if nothing had occurred; curtsied them in, and hoped that Mr Byfield would not think the worse of her; she was a poor girl; and though great folks might live without a character, she could not.

Mrs Gresham told Miss Dawson the fact she had learned as delicately and carefully as it could be told; and accounted for the old man's strangeness by expressing the desire he felt to see, himself, how she would bear the rubs of life. She thanked God earnestly for the disclosure. The old man knelt by her bedside, and called her "his child"—"his dear child"—"his only hope and comfort on this side the grave. Alas! people who are liberal of the bitters of existence, should remember that poison, even unto death, may steal into the cup.

In a few hours, Emily was removed upon luxurious cushions to the house of which she had become the most honoured mistress; even Mrs Hylier sent her little girls to minister to her comforts; and Mary was of course with her. A sudden spirit of sisterly love and tenderness sprang up amongst those who had been accounted censorious and malevolent; and the surrounding maids, wives, and widows, became animated by a most extraordinary longing for inquiring into the state of Miss Dawson's health. They ascertained what Mr Byfield's name had been, and that he had changed it to avoid his daughter's recognition. This knowledge afforded them satisfaction; they did not even venture to censure the unpardonable harshness from a father to a child, though some of the more independent spirits amongst them insinuated, that "it was at least very strange, and carrying resentment farther than *they* could have done." Mrs Ryal was the only one who remained firm to her first "principles" and opinions.

Every thing that skill could suggest, or luxury invent, was resorted to for the relief and comfort of the long-neglected girl. The great physician of the day told her grandfather, who stood before him with clasped and trembling hands, watchful eyes and ears, drinking in his words, that when she was able to be removed, he would recommend the south of Italy. This was in her dressing-room—a room hung with pale pink silk, where the softest breeze whispered its way amid crowded exotics, and the very light of heaven stole through tinted glass; where the old man himself removed his shoes before he entered, lest the smallest noise might disturb the creature cushioned upon satin, who, only a few weeks before, was expected to brave cold winds and everlasting fatigue. The reaction upon the grandfather's mind amounted almost to insanity. The stern, bitter satirist, had melted into a fond old man, who seemed absorbed in having once more something upon which he could safely pour out his long pent-up affections. It was not that a new nature had sprang up in him; it was only the nature of his youth returned. The truth was, *it was himself with whom he had been ill at ease, and not the world.* This is more frequently the case than we are inclined to believe.

The physician again felt her pulse, spoke a few kindly words, and departed. So softly did Mr Byfield follow him down stairs, that he did not even hear his foot-fall; but he arrested his attention when in the hall, by pressing his arm. "Sir, sir," he said in a trembling tone; "in here—speak softly—she does not love noise. You said, when she was able, we were to go to the south of Italy. Now, how soon will that be? We have had some sharp north winds—those keep her back; but will it be when the wind changes?"

"Not so soon as that, my good sir; but I hope soon—*indeed* I hope it—she has interested me much. You must keep her quiet—perfect repose—she must speak but as little as possible; she must not exert herself in the least; her lungs have been over-worked."

"God forgive me; they have, they have!"

"Very natural, my dear sir; you should have liked her to read and talk to you; but you must give that up," continued the physician, not knowing her past history.

"Ay, sir, ay—but Italy; when will she be able to be removed—in a week—a fortnight, perhaps—three weeks?"

"Indeed, I hope so. We can, you know, only do our best, and hope."

"Yes, sir; we can pray—and I do. You think it may be a month?"

"I cannot possibly tell to a particular time. We must watch the symptoms, and act accordingly."

"Certainly, sir; but you say the climate is not fit for her?"

"It is not; but she cannot bear exertion yet. Good morning, my dear sir; I will try and be here to-morrow precisely at the same hour."

"You do not trifle with me, sir, do you?—raising hope to destroy it?" inquired the old man, almost fiercely.

"I have raised no hope," returned the doctor. "If she bears removal, it must be to the south of Italy." Mr Byfield caught at the back of a chair, and gasped for breath; at last he repeated, "If—if; you said *if*. Is there any doubt, then?"

The agony and despair lined in the old man's face compelled the doctor to lay down his hat; and the next moment found him seated by Mr Byfield's side.

* I am happy to say that this will not be much longer a reproach to England; a few kind-hearted estimable persons in this neighbourhood (Old Brompton) have already advanced considerably with a plan and subscription to open an asylum for the relief—if cure be impossible—of consumptive patients.

"My dear, good sir, I never deceive; but I hope you will nerve yourself as becomes a Christian. All things are possible; and every thing shall be, indeed of late *has been*, done, to overthrow our insidious foe. If I had seen her sooner"——the old man started as if an asp had stung him; "though, indeed, that might not have availed much," continued the ready doctor; "she is young—the summer before her—let us hope for the best, and do our best; but I tell you frankly, the symptoms are against us."

"But she said she was so much better this morning?"

"It is a cause of exceeding thankfulness to find her so cheerful."

"And a good sign, sir?"

"The sign of a good mind," replied the medico, evasively.

Mr Byfield was gratified by the idea. "And so she has—an angel's mind," he answered. "Perhaps you can tell me to-morrow about Italy, sir. I have worked hard all my life, and have been a thriving man—more rich than people think, sir. I will heap gold upon that table, so that you can hardly move it, if you but save her life."

"What an extraordinary development of character!" thought the physician, as his carriage rolled away; "why, a tithe of this care would have saved her—ay, six months ago!"

"And where have you been, dear grandpapa," said Emily, as he stole again into her room, to sit and look at her, as he had done during the past weeks, until they had grown into months. "Where have you been?"

"Hush! you must not talk!" he said.

"Oh, but I may, a little under my breath. I used to be obliged to talk, but now it is a pleasure. Do let me mention what we spoke of yesterday—the nice almshouses you said you would build for old governesses. Oh, how glad I shall be to see the first stone laid! When shall it be?—Next August, on my birth-day?—Or, come here, I will speak very softly, if you will not be angry. My poor mother! She used to be so proud of her governess-child! Would you lay the first stone on *her* birthday—the first of September? Thank you, dear grandpapa! Bless you! I see you will! I shall not want to go to Italy; that will cure me!"

It was beautiful to observe, that, though this creature loved life, as a young bird loves to poise upon its feeble wings, she did not fear death. As her frame decayed—as she wasted into a shadowy outline of what all those who had known her *now* declared had been so beautiful, her mind, freed from the grosser particles of earth, became more buoyant—purer it could hardly be—though more ethereal, when her cough permitted short snatches of sleep. She seemed as if, through those thin eyelids, she gazed upon all the mysteries of the uncloaded world; a perpetual smile parted the pallid lip, like the division of a lily-bud; and when she awoke, it was to confer fresh interest on the things of life—an angel bringing the odour of paradise on its wings.

Poor Miss Mercier would kneel for hours by her side, and smile and weep by turns. "It did her good," she said; and she said rightly. Such scenes do good; they strike upon the heart; there is no deception in them.

"Do not weep for me," said Emily; "I shall be better soon. Every day I become better; and if I could only make you feel the importance of your duties, I should be so much happier. I am changed, though, a good deal. Were I to teach again, I would try and interest my pupils more about Hereafter than I did before. I would talk to them much more about the heavens, those lightsome heavens where the just are made perfect; it is so happy to think of their radiance, their glory, their everlastingness; and to think of this beautiful world, in which I once sorrowed and laboured, and yet loved; for surely it was created by God as a place of transit, where the good may have a foretaste of that happiness prepared for them hereafter!"

She would talk thus to all, pouring forth the very sweetness of wisdom, so that people wondered how she had gained such knowledge. Her two former pupils could hardly be separated from her; and though her grandfather manifested much impatience at being disturbed from her side by any one, still he was so proud, even during those awful hours of her goodness and sweet mind, that he could not refuse them admission, but made up for disappointments by stealing into the room during the night, and watching or praying while the heavy-eyed nurse slept. Each day the physician came, and each day the old gentleman would follow him outside the door, and inquire, as though the question were still new—"When will the time come? When may we go to Italy?" And the doctor would reply, with a kind look, "Not yet."

Even to Mr Byfield, to every one but herself, it was evident she was dying; it is almost too hard a word to apply to such a passing away; it was as if a rose dropped leaf by leaf, until the last few that remained trembled on the stem. She said, every day, she was better, much better; she had no pain now; and she should soon be able to drive out in the warm sunshine. Her friend, the clergyman's sister, came to her from the country. And the clergyman himself, he who had attended her mother's death-bed, prayed beside hers. It might have been that the young man loved her; but she never dreamt he did—never. She talked a great deal of the past and future, and of what blessings would arise from a higher-toned education. And one morning in particular, when the doctor called, he reproved her for wasting her strength in words. Again Mr Byfield followed him outside the room, and the physician led him into another apartment, and closed the door.

"My dear sir," he said, "our dear patient is very weak to-day."

"She said she was better," replied Mr Byfield.

"She is not; her mind is purer, and higher, and holier than ever; but she is sinking."

"Not unto death?" muttered the old man.

The physician turned away; he could not bear to look upon his earnest features.

"God bless you, sir; you have a great consolation; every thing has been done that could be done; I wish I was as sure of heaven; good morning—be composed."

The old man turned away—he was alone—he sank into a chair; burst after burst of tears convulsed his frame. It was nearly four hours before he could enter her room again; he saw she was greatly changed in that short space of time, and yet she hailed him with her feeble voice, declaring she was better; he motioned Miss Mercier, who had been with her, to leave the chamber. He took her hand in his, gazed earnestly into her face, and sank upon his knees.

"It is not time for prayer yet, is it?—it is not night yet?" she said; "but pray, dear grandfather, I was wrong—it is always time for prayer."

"I am going," he answered, "to pray to you. Listen! Here, on my knees, I do intreat your pardon; an old man, whose harshness deprived you of your mother—whose harshness has abridged the length of your sweet life. I did not intend to try you beyond your strength, but I ought to have known better. I chained you with those hands to the galley, when I should have given you freedom. Can you forgive me, Emily? And when you meet your mother, will you ask her not to turn from me in heaven as I turned from her on earth. I will never rise till you forgive and bless me!"

The poor girl was deeply affected; she threw herself feebly forward and clasped her arms round his neck, and pressed her cheek to his. She poured forgiveness and blessings on his white head, and fondly pushed back the silver hair from his brow. He replaced her on her pillows; but the exertion had shaken the sand in the glass of life; it was passing rapidly.

"You will be kind to those I love," she said, "and truly forgive those who were harsh to me; and you will be very good to poor Mary; and—oh, heavenly Father, receive my spirit!"

These were her last words. The old man, frantic with grief, dispatched the nurse, who had just entered the room, for help; and when she returned, the dead face of his grandchild was resting on his breast, and he held up his finger, and said, "Hush! hush!" as though she slept, which he believed she did; and all night long he remained in the same position, murmuring every now and then, as if soothing a slumbering infant.

The old man is still living, but they say his mind is gone. Certainly his affections are in the grave, which he persists in saying was dug by his own hands.

THE EMIGRATION OF THE SEMINOLES.

When the memoirs of the eastern emperor, Baber, were published a few years ago, a critic remarked, how much subject-matter for history even of recent occurrence must remain unwritten and unknown, since here was a great potentate whose life had been full of the most splendid transactions, but whose very name had scarcely as yet appeared in an English book. The same remark might be made as to contemporary history, when we reflect that the United States have for six years past been pursuing a war of the most extraordinary nature, full of romantic enterprise, with an object calculated to raise feelings of the deepest interest, and *costing an enormous sum*, yet which has hardly been alluded to in British newspapers. We suspect the truth is, that the public cannot afford notice, sympathy, or interest, for more than a small part of what goes on in the world, and that their selection of the part in which they are to be interested depends very much on their being in some way personally concerned or affected by it. This is a consideration which might be expected to discourage us from making reference to the Florida war; but somehow it has not had this effect. We have ourselves felt considerable interest in some information on this subject which has come under our attention; and we are vain enough to suppose that we shall be able to awaken similar feelings in our readers.

Florida is a large flat swampy peninsula, on the east side of the Gulf of Mexico. Chiefly in a natural condition, and very scatteringly inhabited, it was transferred by Spain to the United States in 1821. It then became an important object with the States government to clear it of the few thousands of Red Indians of the Seminole race who possessed it. The plan usually taken by the States to get rid of Indian races from any territory which they wish to *settle*, is to bargain for their emigrating to some out-of-the-way district beyond the Mississippi. Such bargains are not easily managed; for, though the States are kind enough to appoint an officer of their own, whose nominal duty it is to take charge of the Indian interests, there is, after all, great difficulty in ascertaining that the bulk of the people, or even of the chiefs, fully assent to the conditions, or are at heart disposed to carry them into effect. The Seminoles are said to have agreed, in 1832, to transfer themselves to the Far West, in three detachments, one each year, on certain conditions. A deputation of their number was to select the new ground for the nation, and the first detachment was to go in 1833. As far as we can understand the case, it was impossible to have all the arrangements made in time to admit of this first migration taking place in the stipulated year, even if the Indians had been willing. They are naturally dilatory in all things, and they are particularly slow to leave a country endeared to them as the land of their fathers. It also appears that they found themselves overreached as to some of the conditions. In short, 1835 came, and the emigration had not even begun. The president then determined that that which had been to take place in three years should be, at whatever hazard, *done in one*. That some were willing to go, appears certain; but it is equally certain that others were extremely hostile to the movement. Amongst these was a young chief called Oceola. One anecdote of this man—of which we unfortunately are unable to give the exact date—speaks his sentiments powerfully. At a meeting at Camp King, General Clinch produced the treaty for the signature or *mark* of the chiefs. It was in a beautiful glade amongst the luxuriant forests of Florida. The document lay spread upon a table, midway between a party of the States soldiery and the Indian braves. Some had peaceably signed the paper, and it came to the turn of Oceola. He, with a proud step and a disdainful curl of the lip, approached—drew a dagger from his bosom—and striking it through the paper and the table together, till the glittering steel was seen below, exclaimed,

"There is my mark!"

He was seized, bound with ropes to a tree, and kept for a time in solitary confinement.* But either he should never have been meddled with, or he should never have been liberated: with such a man there was no proper middle course. By the time that the deputation returned to report on the new lands, Oceola had put himself at the head of a party who were determined not to remove. The deputation reported in favour of their yielding to the treaty. For this, its head, Enematkla, was openly shot down like a mad dog. His death leading to no retaliation, showed that the national feeling was with Oceola. Immediately after, a covert party, said to have been headed by Oceola, killed General Thomson, who had been Indian agent in this case, along with five others, as they were walking under the very shadow of Fort King. It has been stated, that Oceola used on that occasion the identical rifle which Thomson had formerly presented to him with the hope of conciliating his friendship: the intermediate confinement and harsh usage had obliterated the obligation. The warrior then sent a negro to General Clinch, the governor at Fort King, to tell him that he had a hundred and fifty barrels of powder, which should all be consumed before his people could be conquered, and that he would lead the cheating pale-faces a dance of five years, for their insolence towards himself and his warriors.

The government proceeded to take measures for the removal of the Indians, but it greatly under-estimated the numbers and the spirit opposed to it. President Jackson had been Governor of Florida; he had once easily routed a party of the Seminoles; and he was led to believe that they had not now above four hundred warriors. The force sent was therefore inadequate to the purpose. The first blow struck by the Seminoles might have raised an alarm. A detachment of 114 men, with a six-pounder, under the command of Major Dade, was proceeding through the country, when the Seminole warriors set upon it, and cut off all but two men. That patriotism of the Indian kind, and no meaner feeling, animated the victors, was at the same time proved by the condition in which the slain men were found, not one of the corpses having been stripped of a single article of value. The bulk of the States forces were now pursuing a march in the same direction by a different route: they were almost simultaneously met by a party of the Seminoles, and an obstinate and sanguinary contest ensued. The Indians were driven from the field; but the States army was obliged, by its losses, to retrace its steps, thus seeming to give up the war at the very beginning. It cannot be doubted that the Seminoles were much encouraged in their resistance by the results of this first campaign.

The government lost no time in sending larger forces, but it did not calculate on the difficulties which the troops had to meet in conducting such a warfare. For many months the Indians were successful in almost every encounter. Oceola continued to be their commander, and never did any warrior signalise himself by greater courage. The government and people became surprised at the slow progress of the Florida army in *removing* the Indians. The following account of the scene of its operations makes that any thing but wonderful:—"When the regiments began their march through different portions of the peninsula, they at once plunged into a *terra incognita*, and groped their way to the designated points with constant embarrassments, that were as unexpected as they were perplexing. The surface of Florida is generally divided between *hummock* land and pine barrens. [A hummock is a marsh overspread by tangled natural forest.] The barrens are moved over by troops with comparative facility, but being every where intersected by spurs of hummocks, or by the hummocks themselves, no march of many hours can be made in any section of the territory, that does not encounter impediments which obstruct, delay, or, perhaps, entirely turn it aside. Besides, in the more southern portions of the peninsula, there are cypress swamps, the most impracticable of all the embarrassments that beset military operations in Florida. The cypress has a base that spreads like a trumpet's mouth, and, though the trees may stand many feet apart, they almost crowd at the surface of the earth; while nearly every interstice is filled up by 'cypress knees,' which are sharp, slender, and short cones, seemingly set there like artificial obstructions to a march. In the enumeration of difficulties, we must not forget the saw-grass and saw-palmetto, both of which have serrated edges, made harsh and unyielding by the

* A Narrative of the Early Days and Reminiscences of Oceola Nikkanochee, &c. London: Hatchard and Son. 1841.

mineral substance they take up in their growth, which tear the clothes, and lacerate the legs and feet of the soldiers moving through them, to a degree that can scarcely be comprehended by those who have not seen or felt their effects. The trace of a column through these lets and hindrances has often been marked by blood and tatters of clothing."*

It is easy to conceive under what disadvantages the American soldiers contended with a foe always distinguished as much for insidiousness as for valour, in a country so unfavourable to all regular military operations. Large detachments were often cut nearly to pieces. One great cause of the ill success of the Americans in their first campaigns was their eagerness for immediate success. The government, actuated by the same feeling, thought it necessary, at every blow suffered by their troops, to make a change of officers. New officers brought new dispositions and plans, along with ignorance to be corrected by bitter experience; and thus no progress was made. For one horrible feature of the contest—the murdering of all prisoners—it is difficult to say which party was to blame; nor is it very clearly shown how the Americans came in time to pay no regard to the white flag. But even these atrocities sink before one which was afterwards introduced. When the American generals found themseves baffled in ordinary warfare, and no appearance of a speedy end to the contest, they introduced blood-hounds from the West Indies, with which to search out scattered parties, and help to overpower them. There can be no reason to doubt, that many wretched human beings were torn down and killed by these ferocious animals.

The Seminoles suffered a great blow in the latter part of 1837, in the capture of their most distinguished warrior. There is too much reason to believe, that Oceola was a victim of the white man's treachery. A chief named Caococchee, or Wild Cat, hardly less celebrated than himself, had been induced to listen to terms for yielding to the wishes of the government. The officers, reposing faith in him, sent him to endeavour to prevail upon Oceola to join him in the capitulation. On his return, some appearances induced the officers to withdraw trust from him, and send him as a prisoner to St Augustine. Oceola came, apparently, to confer about emigration, but, it was suspected, with the secret design of making a sudden attack and liberating the prisoners, if he should see fit. He was attended by eighty well-armed warriors, who, according to stipulation, placed their arms against a tree at some distance. At a preconcerted signal, in spite of the flag under which he came, the warrior was surrounded and made prisoner, and the arms of his companions seized. He was immediately sent prisoner, with his wife and child, to St Augustine, whence he was soon after removed to a prison on Sullivan's Island, near Charleston, in South Carolina. There was a strong feeling throughout the States that he had not got fair play; but his restoration to liberty was not once hinted at. The eagle spirit pined in its confinement, and Oceola was not long a living man. When it was known that he had died, there was an universal feeling of sympathy, and this savage warrior was actually buried with the honours due to a general. There has since been erected over his grave "a handsome monument," bearing the single word OCEOLA. The fact is, that the literary sense of his merits as a hero of romance, had caught the fancy of the Americans. Amongst many of their sentimental effusions about him, the following, which is designed as a dirge of Seminole warriors, seems the best:—

"Go to thy rest—
Not where the green and tall magnolias bow
Slowly and solemnly their lofty crests—
Above the violet grass we lay thee now!

Not where the pine
With dreary sighing answered back thy tread,
When forest dwellers made beneath its shrine
The ancient places of their silent dead.

Not where the stream,
Beneath the arching wild vine, whispers low,
With spirit voices—when the sun's last beam
Falls, where it bathes the warrior's dust—we go.

To thy dark bed
We would not that *their* music's wail should come,
Nor see *them* bend the plumed and glittering head,
In stately mourning to the deep-toned drum.

They mock us well—
With banner waving, and that hollow sound,
Long pealing from the battlements, to tell
That *thou*, our brave, hast ransom found.

Why should *they* grieve,
E'en while their pale blood curdles to the heart,
Beside thy grave—that thou *their* bonds canst leave,
And to our fathers' hunting-fields depart?†

We do not weep—
The Red Man hath no tear to shed for thee—
Smiling, we gaze upon the dreamless sleep,
The fortress broken, and the captive free.

Hither we bring,
Ere yet this earth on thy cold brow we lay,
Thy boy—for one wild moment here to cling,
In love's first sorrow, to those lips of clay.

Bend low and near—
Nor sigh or moan must break our chief's repose—
Yet, boy, on thy young heart be written here,
A deep and burning memory of his foes!

We ask not fame—
We call not vengeance for the faith we gave;
Trace in the language of your land his name,
And show *your* sons the Seminole's Grave."

The Florida war has been attended with many complicated and most laborious operations, costing a vast sum to the national treasury. Throughout the whole peninsula, which is barely inferior to England in extent, it has been necessary to form roads and build stockade forts. Were these roads, says our authority, laid down upon a map, they would cover it like a network. "During the first few years of the war, the tribes were known to occupy certain locations, where they were accustomed to plant their corn, and have something like fixed habitations. These were easily found, as the operations of the war spread out, and were successively destroyed. But after the tribes became broken up, and the bands were multiplied, though small in force, the planting grounds and habitual resorts of the women and children were removed to other far more sequestered spots, surrounded by dense hummocks and wide-spreading waters, which seemed to baffle all attempts at discovery. In more recent seasons, when the troops had acquired habits that enabled them to assimilate their operations to those of the Indians, and where competent guides had been arrested from the enemy, and compelled, under *peine forte et dure*, to play an Ariadne's part, these retreats were explored. It was surprising to notice with what tact they had selected these lurking places, so well adapted, upon military principles, by making the arrangements of nature supply the place of art, to give them security. And certainly none but an eye familiar with signs that speak alone to an experienced observation, could have guided the scouts through such a maze of forest, marsh, and water, as surrounded them. No accident or blunder could have led troops to penetrate such pathless hummocks, to wade through such broad morasses, ever on a zig-zag route, that seemed constantly abandoning its probable object, to stumble at last upon a few acres of dry earth, where a remnant of wretches had sequestered themselves, under a flattering hope that seed-time and harvest would there be permitted to follow each other in unmolested succession. It would be vain to attempt a detail of the annoyances, fatigues, and wants, of these stealthy marches, which often run through a series of days and nights, frequently at the mercy of an unwilling guide, who might at any moment propose to offer himself, by false leading, as a sacrifice for the benefit of his tribe." After 1838, the Indians had chiefly taken refuge in the district of what are called the Everglades, in the southern portion of the peninsula, being the most inaccessible of all these wildernesses. But such was the perseverance of the soldiery, that these were, within two years, penetrated in three directions. This success had not been expected by the Seminoles, and the consent of a considerable number to the emigration was the consequence. Indeed, towards the close of 1840, the resistance of the Indians was all but extinguished. Routed out from their very last strongholds, and scarcely ever permitted to raise smoke twice from one place, the few remnants of the tribe could scarcely be said any longer to be in a hostile position. By that time, moreover, so many had been, by one means and another, forced to the west of the Missouri, that they were beginning to look upon that district as their home.

The war is said to have cost the States six millions sterling, and eighteen hundred men. We cannot wonder at either item, when we consider the vast number of troops required, and the arduous and sanguinary character of the contest. Of the number of regular troops usually employed we have seen no account; but we find, that between 1836 and 1840, more than fourteen thousand of the citizens of the neighbouring states left their homes, mostly mounted, and poured into Florida, to the assistance of the State soldiery. This militia were not without some warrant from the government for their interference, and they seem to have had their expenses paid; but the movement partook much, after all, of that volunteer character for which we are prepared by what we have heard of Canadian and Texian sympathisers. Five hundred came from Missouri, and two thousand from Tenessee, both of them comparatively distant states. "More than a thousand volunteers collected in Georgia in 1838, and came into Florida. *The first information the general in command there had of this movement was communicated by a newspaper paragraph*, and before scarcely a hurried step could be taken to meet the wants of such a column in a region where no *depôts* were provided, and where there were few means of obtaining supplies from other parts, it was upon the ground of action." These particulars are highly characteristic of the frontier populations of the States; but such auxiliaries could not be useful in proportion to their expense. Much of their time of service was spent in travelling to and from the scene of warfare; and when upon it, with all their activity and zeal, they fell far short of the practised aptness of the regular troops. The irregularity of their coming was also troublesome. The thousand Georgians above-mentioned were probably a little surprised to find that they occasioned a retreat of the party which they expected to strengthen; but the step was unavoidable, on account of the unprovided state of the commissariat.

The remarks which the *North American Review* makes upon this "protracted, vexatious, humiliating, and burdensome contest," must be generally responded to. "Strength and gain were on one side, weakness and loss on the other. Such relations inculcated lenity and patience in the powerful—the benefited party. An inflexible exaction of submission to terms which the Indians protested were neither expressed nor implied by the treaty as they assented to it, and an impatient requirement that the specific work of three years should be consummated in one, showed no leaning towards either of these benignant qualities. The Seminoles believed that they were outraged and contemned, and turned upon their oppressors with a fury that has raised a cry of horror through the land for years. Their fatal success has proved that the weak may sometimes be so strengthened by accident or circumstances as to be able to do enormous harm; that no nation or tribe, however insignificant, should be unnecessarily provoked to hostility, lest a power of vengeance be imparted to them beyond all foresight or calculation. The servile war in Rome, and the Maroon war in Jamaica, are examples which show that contests may be begun in scorn or heedlessness, which run through years of disappointment and humiliation, draining the treasure and wasting the life-blood of a great nation."*

† Indians believe that if they are brave and good in this world, they will be rewarded in the next by being placed in excellent hunting-grounds.

POPULAR INFORMATION ON FRENCH LITERATURE.

THIRTEENTH ARTICLE.—RONSARD.

ONE of the most distinguished of the French poets of the sixteenth century was Pierre de Ronsard, whose name has already been mentioned in the present series. He was of a noble family; and indeed, in those days of limited education, few but the scions of noble families attained literary distinction. His father was a person of so much consequence as to be selected to take charge of the household of Prince Henry, son of Francis I., when the former was sent into Spain as a hostage for his father, made captive, in 1524, at the battle of Pavia. Born on the 10th of September of that year, Pierre had not the advantage of his father's personal care in his very early days. But his education was not neglected; and, at the age of nine, he was sent to the Royal College of Navarre at Paris. From this seminary he was taken away by his father, whose interest readily got him placed in the households, successively, of two sons of the French monarch. Thrown thus into court circles, young Ronsard showed such a lively turn of mind that he was selected as one of the gay train of Princess Magdelene, when she went to Scotland, to share its throne with James V. At this time he was a mere boy—a page. He remained two years and a half in Scotland, and six months in England, after which he returned to France, and reentered the service of Charles Duke of Orleans, third surviving son of Henry I., and afterwards Charles IX.

We form a high idea of Ronsard's general quickness of talent, from the fact that, though but between fifteen and sixteen years of age, Charles of Orleans intrusted him with various missions at this time, and among others, one to Scotland. Escaping shipwreck narrowly on his return, Ronsard was employed in other services, which brought him into friendship with the family of Du Baif, one young member of which, Jean Antoine du Baif, afterwards gained eminence as a poet. Ronsard had up to this period attended only to the courtly accomplishments of the time; but the activity of his life brought on deafness and some other debilities; and the preceptor of young Du Baif seems to have been then fortunately at hand to give the necessary stimulus to his literary powers. He had previously known Latin; he now acquired the Greek with rapidity, and became passionately fond of its great writers. For five years he shut himself up, indulging in these studies. He translated the *Prometheus* of Æschylus, and the *Plutus* of Aristophanes. Though no one who knows the latter piece could almost conceive the possibility of such a thing, yet his version of the *Plutus* is said to have been actually represented on the stage. Be this as it may, Pierre de Ronsard had now found his vocation; and an interview with Joachim du Bellay, in 1549, strengthened his poetical propensities, and laid the foundation of a friendship, not the less warm and enduring because occasionally disturbed by the jealous irritability of the poetic race. Ronsard soon turned from translating the thoughts of others to the diffusion of his own in verse; and his works, well received by the court, with a few exceptions, accumulated to a large amount. He exercised himself in all varieties of poetical composition. Two books of *Loves* came from his pen, containing an amazing number of sonnets, songs, elegies, and madrigals; five books of *Odes* upon all imaginable subjects; the *Franciad*, an epic poem upon the career of the great Francis; *Eologues*, *Hymnes*, *Gaieties*, &c. —such were among the compositions which he issued, and such their titles. He took precedence, in the favour of the court, then the sole arbiter of poetical merit in France, of Du Bellay and Saint Gelais, but was nevertheless much blamed for his pertinacious adherence to Greek diction and models. Boileau has sanctioned the charge.

* Recent accounts state that the war is not yet quite concluded; but the number of Indian warriors is believed to be reduced to a hundred and twenty, and these it is proposed to capture by offers of rewards, instead of fighting any longer.

It is now time, however, that we should intersperse with our dry prose some specimens of this poet; and having a number before us ready cast into English verse, we shall take leave to draw upon these sources. The following is an ode addressed by Ronsard to the delights of the early year:—

"God shield ye, heralds of the spring,
Ye faithful swallows fleet of wing,
Houps, cuckoos, nightingales,
Turtles, and every wilder bird,
That make your hundred chirpings heard
Through the green woods and dales.

God shield ye, Easter daisies all,
Fair roses, buds and blossoms small;
And ye, whom erst the gore
Of Ajax and Narciss did print,
Ye wild thyme, anise, balm, and mint—
I welcome ye once more.

God shield ye, bright embroider'd train
Of butterflies, that on the plain
Of each sweet herblet sip;
And ye, new swarm of bees, that go
Where the pink flowers and yellow grow,
To kiss them with your lip.

A hundred thousand times I call
A hearty welcome on ye all:
This season how I love!
This merry din on every shore,
For winds and storms, whose sullen roar
Forbade my steps to rove."

The next translated specimen, from the same pen (an anonymous one,) presents an ode yet much admired in France.

"Fair hawthorn flowering,
With green shade bowering
Along this lovely shore;
To thy foot around,
With his long arms wound,
A wild vine has mantled thee o'er.

In armies twain,
Red ants have ta'en
Their fortress beneath thy stock:
And in clefts of thy trunk,
Tiny bees have sunk
A cell where their honey they lock.

In merry spring-tide,
When to woo his bride
The nightingale comes again,
Thy boughs among,
He warbles the song
That lightens a lover's pain.

'Mid thy topmost leaves,
His nest he weaves
Of moss and the satin fine,
Where his callow brood
Shall chirp at their food,
Secure from each hand but mine.

Gentle hawthorn, thrive,
And for ever alive
May'st thou blossom as now in thy prime;
By the wind unbroke,
And the thunder-stroke,
Unspoil'd by the axe or time."

When the beauteous daughter of Ronsard's former patron, James V., grew up to womanhood, she visited France, to be wedded to the Dauphin. But it was not the fate of Mary Stuart to be happy in any of her marriages. The Dauphin died, and Mary of Scotland returned to her home. Yet she had learned to admire Ronsard; and, even in her evil days, she showed her admiration by sending him a present of two thousand crowns, and causing a mimic Parnassus of silver to be made and transmitted to him, with the inscription, "To Ronsard, the Apollo of the Fountain of the Muses." Ronsard was not less partial to Mary Stuart, than she was to him. He says—

"I saw the Scottish queen so fair and wise,
She seem'd some power descended from the skies.
Near to her eyes I drew—two burning spheres
They were, two suns of beauty, without peers.
I saw them dimm'd with dewy moisture clear,
And trembling on their lids a crystal tear;
Remembering France, her sceptre, and the day
When her first love pass'd like a dream away."

Alas! years had now sped on. Mary was in an English prison when she sent to the poet her remembrances; and, with his tribute to Mary, Ronsard paid an accompanying one to her persecutor and executioner, Elizabeth, who had also courted his favour by the gift of a diamond ring.

Ronsard, in the mean time, had witnessed many changes in France. Born in the time of Francis the First, he had seen that king, and three of his successors, pass successively and prematurely to the tomb, after each had held the throne for a time. All of these sovereigns patronised Ronsard, but more particularly Charles IX., who, as was noticed in a former article, exchanged verses with the poet, and allowed him considerable freedoms as a monitor. Henry III., too, countenanced him above the other poets of the day. Yet with these, as his addresses to them show, he kept, for the most part, on friendly terms. To Remi Belleau, for example, he paid rather an elegant compliment, in the shape of an epigraph having reference to Belleau's "Loves of the Precious Stones."

"Toil not to lay on Remi's head
The marble placed o'er other bones,
For he himself has built his bed
Of Precious Stones."

In the middle of the year 1585, Ronsard, who had been presented with one or two priories for his subsistence by Charles IX., grew ill at that of St Come, near Tours, whither he had retired for some time. He had spent, according to De Thou, a somewhat irregular life; but his last days were marked by humble penitence and resignation, and he expired on the 27th December of the year mentioned. He was buried at St Come, by his own request.

Another little piece may be given before concluding, as a further exemplar of his style.

"TO A POOR MAN.

Why dost thou tremble, peasant, say,
Before the men who empires sway?
Who soon will, shadowy sprites, be led
To swell the number of the dead?
Know'st thou not that all must go
To the gloomy realms below?
And that an imperial ghost
Must no less the Stygian coast
Visit, than the humble shade
Of him who plies the woodman's trade?
Courage, tiller of the ground!
Those who hurl war's thunder round
Will not seek their last abode
In arms, as when the battle glow'd.
Naked, like thee, shall they depart;
Nor will the hauberk, sword, or dart,
Avail them more, when they shall flee,
Than thy rough ploughshare shall to thee.
Not more just Rhadamanthus cares
For the mail the warrior wears,
Than for the staff with which the swain
Urges on the glowing train;
By him with equal eye are seen
Thy dusty raiment, rude and mean,
And purpled robes of Tyrian hue,
Enwrought with gems to charm the view,
Or all the costly vestments spread
Around the forms of monarchs dead."

Respecting the general merits of Pierre de Ronsard as a poet, the critics of his own country differ so widely in opinion, that a foreigner would be presumptuous in speaking decidedly on the subject. Almost all agree, that where he thought himself strongest he was really weakest. He used to pride himself on "Pindarising," as he called it, in his Odes, though he was very far indeed from attaining to any thing like the reach of Pindar, either as regarded thought or diction. Where he cast off all models in both respects, and wrote naturally, he shows, to use the words of a modern critic, that "he had many of the qualities that make great poets—force and brilliancy of imagination, fecundity of thought, and happiness of invention."

A FEW WEEKS ON THE CONTINENT.

VEVAY—CHILLON.

TEMPERATURE 70 degrees in the shade—a brilliant sun overhead—not a cloud on the purple-blue firmament—and, withal, a freshness of air curling the face of Lake Leman—were the characteristics of the finest, and what we considered the *greatest*, day in our journey—that on which we made an excursion from Lausanne to Chillon. The distance is about ten or twelve miles, by a pretty nearly direct route along the margin of Lake Leman, in an easterly direction—the road going through several small towns and ancient villages, and winding at other times through a universal vineyard. With a range of hill on our left, partitioned terrace above terrace, with vines trained in all sorts of forms; while bunches of ripe grapes lolled over the walls, almost dropping into the mouths of the passengers; and at a short distance below, on our right, the clear mirror of the lake, overhung on the south with the eternal and gloomy hills of Savoy—we enjoyed beyond description the charms of this felicitous scene. In weather somewhat more cool, a sauntering walk through a country so rich in natural and historical interest, would have been doubtless very desirable; but, on the present occasion, pedestrianism was quite out of the question, and we were fain to indulge in the more easy recreation of being conveyed in an open and first-rate vehicle, furnished by our good host of the *Hi-bon*.

The road is good, but bent up and down to accommodate the undulating face of the hill, and somewhat narrow. It is, however, well protected by walls; and looking down on these, we had a constant source of amusement in watching the gambols of hosts of lizards, with which the crevices seemed to be tenanted. They are exceedingly beautiful creatures, of a greyish-brown colour, rather less in size than a mouse, but with a long and flexible tail. Nothing could exceed the brilliancy of their little eyes peering out from the chinks beneath the stones; and their feet being of the sucker order, like those of the house-fly, they run with as much agility up the face of the walls as if on level ground. The sight of these pretty creatures, which are quite innocent in their nature, was accepted as an indication that we were near the borders of Italy, their proper habitat; and things, as we thought, began to wear a dash of ultramontanism.

The chief town on our route was Vevay, a place in the course of rapid improvement, and possessing a number of handsome houses, and some tasteful promenades in the environs. One side bears closely on the lake, and here steam-boats touch every two or three hours, in communication with Geneva, Ouchy, and other ports. A fitter situation for a resting-place for tourists can hardly be conceived, for in the neighbourhood is some of the finest scenery in Switzerland; and it is little more than a day's run from Italy, by the road up the Valais. We stopped a short time at Vevay, in order to see its ancient church, containing the monuments of two Englishmen of note in their day, who died self-exiled from the land of their nativity. These were Ludlow and Broughton, both concerned in the trial of the unfortunate Charles I.; and here, sheltered by the authorities of Berne, who refused to give them up to the vengeance of the royalists, did they remain till the period of their death. The church of St Martin, containing their remains, is an old Gothic fabric, standing on a sunny knoll overlooking the town; and on our being admitted by a key-keeper, we found the interior furnished in the usual fashion of Protestant places of worship, with as plain benches and as little regard to taste as could be found in any part of the world. The tombs of the regicides are within the northern transept, and covered with pews. The monument of Ludlow, fixed to the wall, is a black marble slab, with a long Latin inscription in sunk gilt letters, commencing—"Siste gradum et respice!—Hic jacet Edmund Ludlow, Anglus natione" ["Halt, and look around!—Here lies Edmund Ludlow, English by birth"], and ending with the date 1693. The monument of Broughton was a few feet from this, and was a stone slab on the floor, covering, as I was told, his tomb. The inscription was also in Latin; and our conductress, by removing one or two of the wooden benches, allowed me to copy it into my note-book. It is as follows:—"Depositorium Andreæ Broughton, Anglicani Maydstonensis in comitatu Canty. ubi bis prætor urbanus. Dignatusque etiam fuit sententiam Regis Regum proferi quam ob causam expulsus patriâ suâ, peregrinatione ejus finitâ solo senectutis morbo affectus requiescens a laboribus suis obdormivit, 3^{cr} die Feb., Anno Domini 1687, ætatis suæ 84." Which may be freely Englished thus:—"The depository of Andrew Broughton, Englishman, of Maidstone, in the district of Canterbury, of which city he was twice chief magistrate. For the cause of the King of Kings he was honoured with exile from his country, and, at the close of his pilgrimage, sank under the weight of old age alone. His toils ended, he fell asleep in the Lord, on the 3d day of February, A.D. 1687, aged 84."

A walk through Vevay showed to us, in a pleasing manner, that the local authorities seem anxious about preserving great order and neatness of appearance. We saw here what I observed nowhere else in the country—a stone pillar at each entrance to the place, on which was carved the name of the town, its division in the canton of Vaud, and its population, which is between four and five thousand. Exactness in such municipal arrangements is common in this part of Switzerland. The smallest village, inhabited by persons not above the rank of peasants, has its own managerial functionaries, and each is provided with a kind of market-place, at which is stuck up, within a trellis, all the public requisitions or announcements, so that none may plead ignorance of what concerns his public or private rights. As elsewhere in Vaud, the people seemed remarkably industrious, and business active. The staple trade of the district is in the wines produced from the adjoining hills; and to sustain and improve the quality of the liquor—which to me seemed a kind of thin Rhenish—no pains are spared. The indefatigable Murray gives the following graphic account of the exertions of the Vevayians in this important business:—

There exists at Vevay "a society or guild of very high antiquity, called *l'Abbaye des Vignerons*, whose object is to promote the cultivation of the vine; and for this purpose it dispatches every spring and autumn 'experts,' qualified persons, to survey all the vineyards of the district, and upon their report and testimony it rewards the most skilful and industrious vine-dressers with medals and pruning-hooks. In accordance with a custom handed down from very ancient times, which is possibly a relic of pagan superstition, this society celebrates once in fifteen or twenty years a festival called *la Fête des Vignerons*. It commences with the ceremony of crowning the most successful cultivator of the vine, which is followed and accompanied by dances and processions formed of lads and lasses of the neighbourhood, attired as fawns bearing the thyrsus, and nymphs. Father Bacchus in his car, and Ceres throned on a waggon filled with wheat-sheaves, appear in the most classical costume in the

midst of their followers. But the procession includes a singular mixture of scriptural characters along with these heathen bacchanals. Thus, Silenus riding on his ass is followed by Noah in his ark, and Pomona is succeeded by the spies from Canaan, bearing between them the bunch of grapes. A vine-press and a forge at work are also exhibited, drawn by five horses. On other days of the fête (for it lasts for several), the spectators are entertained with the native dances and songs of Switzerland, performed by the herdsmen and shepherdesses of the neighbouring Alps; and the concluding, and perhaps the most interesting, part of the festivities consists in bestowing upon a young maiden, the fairest in fame and form in the vicinity, a dower—and in the celebration of her marriage with a partner of her choice. As many as 700 persons took part in the last festival; and some of the ballet-masters of the French opera repaired hither from Paris, several weeks beforehand, to drill and instruct the rustics in dancing. The ground was kept by 100 young men in the picturesque ancient Swiss costume, which has been delineated by Holbein. The two last anniversaries were in 1819 and 1833, and multitudes of spectators flocked from all parts to witness them."

About two miles beyond Vevay, we arrive at Clarens—a straggling village, with a few tolerable houses amidst others of an old and humble order, having, within a few feet, the lake on the one side and the green cultured hill on the other, crowned with a chateau of comparatively modern date. Clarens is no way remarkable in its physical or social features, but enjoys no small notoriety in the regions of sentiment, from being the place where Rousseau resided for some time, and where he has fixed the imaginary scenes of his "New Heloise."

> "Here the self-torturing sophist, wild Rousseau,
> The apostle of affliction—he who threw
> Enchantment over passion, and from woe
> Wrung overwhelming eloquence—first drew
> The breath which made him wretched; yet he knew
> How to make madness beautiful, and cast
> O'er erring deeds and thoughts a heavenly hue
> Of words, like sunbeams, dazzling as they pass'd
> The eyes, which o'er them shed tears feelingly and fast."

Those who, like Byron, can sympathise with the feelings of a man who positively luxuriated in a world of ideal misery of his own creation, and rendered himself conspicuous more for the singularity than the soundness of his metaphysical speculations, will join in the impassioned sentiments uttered by the noble poet in his address to

> "Clarens, sweet Clarens! birthplace of deep love!"

But the every-day world looks more coolly on, and inquiring the character of the scenes depicted, will perhaps say with Scott, that Julie and St Preux were two tiresome pedants, in whose loves there was really nothing to interest any rational feelings.

Associations of sentiment, infinitely more truthful and exhilarating, are roused after passing Clarens, when the grey walls of the old castle of Chillon come prominently into view, at a short distance beyond Montreux, a neat old-fashioned village on the face of the hill. Disregarding Montreux in the meanwhile, we passed on to Chillon, which we found to stand almost entirely within the border of the lake; the outworks, in which was the gateway, being the chief portion on dry land, and immediately facing a high precipitous hill, partially covered with shrubs. A soldier of the canton on duty at the gate, and apparently the only male functionary, admitted us across the drawbridge, into the interior of the castle. The dimensions of the place surprised us. It consists of several open courts, environed by tall, rough-cast structures, of immense strength, and showing on all sides the character of a feudal fortress on a large scale. The castle was built in 1238, by Amadeus IV., Count of Savoy, as a bulwark for defence of his possessions, and what may be called a den whence he could conveniently make inroads on his neighbours. A victory gained by his son in a battle fought near its walls, in 1273, gave him the command of the Pays de Vaud; and hence this southern portion of Switzerland remained under the sway of the Counts of Savoy till wrested from them by the Bernese in the early part of the sixteenth century. For pretty nearly three hundred years, then, we have to look upon Chillon as having been the seat of a petty despot, who was governed by no law but his own capricious will.

Conducted over the massive buildings by a loquacious female keeper, we walked from apartment to apartment, up and down flights of stairs, and from court-yard to court-yard, viewing the excessive strength of the fabric and its gloomy recesses with no ordinary feeling of curiosity. In the lower or underground floor of the western wing, we were shown a well-like gap in the stone floor, which, we were told, had been once covered by a trap-door, which sunk on being trodden upon, and precipitated the unwitting prisoner into a deep dungeon beneath. This was a second version of the traditional murders of the Schloss of Baden-Baden, and may either be believed or not. I confess to a small degree of scepticism on the point. Leaning over the gulf, I certainly saw there was a horrid dungeon below as dark as a pit, but at the same time I observed the relic of a stone step near the floor on which I stood, and therefore greatly doubt the legend of the trap in all its fearful details. Leaving this part of the castle, we proceeded to the main body of the place, which is a heavy building overlooking the lake, and whose back windows command a view of the Savoy mountains on the south, and the gorge of the Valais, at Villeneuf, on the east. Here we were conducted through several halls, long since deserted and disfurnished, but still in good preservation, and showing on the ceilings and walls the remains of coats of arms, and other blazonry of their baronial possessors. The most interesting part on this side of the edifice is a suite of gloomy-arched vaults, entering from a lower level than the halls above, and which, from incontestible appearances, had been what tradition affirms they were—the prison dungeons of Chillon. The first two vaults we enter are said to have been guard-rooms; the next, which is more gloomy and damp, communicated at one time with the hall of justice overhead, by a stair now removed, and in its outer wall was a door, that most likely served as a private postern for exit or entrance by the lake. Immediately beyond this dismal apartment, which our conductress describes as the vault of execution, while she points out the relic of a gallows, we enter the last and much the largest dungeon in the series—the undoubted prison of Bonnivard.

No one who has read the "Prisoner of Chillon" of Byron, can enter the low-arched doorway of this dreary tomb of living men without emotion. It consists of two aisles, separated by a row of seven massive pillars of stone; the aisle on the right, as we enter, being hewn out of the rock, and that on the left being of arched masonry. The floor is altogether of rock, and worn into various hollows. The only light admitted is by a small window, so high up the wall that no one could see out except by climbing, and hence it could have afforded little solacement to the prisoners, more especially as the custom seems to have been to chain them to the pillars. On measuring the vault, by pacing, I found it to be fifty-two steps in length, and it was at about two-thirds of this distance from the doorway that Bonnivard, the last victim of the Duke of Savoy, was confined. On the side of one of the pillars, a strong ring is still attached, and the surface of the stone floor beneath is trodden into uneven forms by the action of footsteps. No poetic license has therefore been taken in the forcible lines—

> "Chillon! thy prison is a holy place,
> And thy sad floor an altar; for, 'twas trod—
> Until his very steps have left a trace
> Worn, as if thy cold pavement were a sod—
> By Bonnivard! May none these marks efface!
> For they appeal from tyranny to God!"

The pillar thus connected with Bonnivard's imprisonment has been an object of curiosity to hundreds of visiters, both before and since the place was consecrated by the genius of Byron. We found it literally carved all over with names, chiefly French and English; and among these, Dryden, Richardson, Peel, and Victor Hugo, were conspicuous. Byron cut his name in strong characters, but some one has rudely disfigured it by a slash across. Supposing this to have been the spot to which Bonnivard was manacled, he could not, by any possibility, have seen the islet on the lake, referred to by the poet—

> "And then there was a little isle,
> Which in my very face did smile,
> The only one in view;
> A small green isle, it seemed no more,
> Scarce broader than my dungeon floor."

The depth of the lake has also been strained beyond the reality—

> "Lake Leman lies by Chillon's walls,
> A thousand feet in depth below."

The actual depth is about three hundred feet, the surface of the water standing three or four feet above the level of the prison floor, and consequently rendering the place damp and miserable to its unhappy inmates. Bonnivard, as I have said, was the last who was here immured. Although prior of a religious establishment, he possessed exalted sentiments respecting civil liberty; and becoming obnoxious to the reigning Duke of Savoy, was seized and consigned to the vault which I have attempted to describe. There he lay for several years; and it must have been a joyful sound to hear the attacks of the Bernese forces by land, and of the Genevese galleys by water, which at length reduced this stronghold of tyranny, and gave liberty to its forlorn captive.

We now took our leave of this deeply-interesting spot, on our return to Lausanne, pausing on the way at Montreux—a small village, lying on the face of the hill a short way above the main road, in the midst of a wide extent of small fields, partly devoted to the culture of vines. I was very anxious to take a look of things hereabouts, and wished I could have spent some days either at Montreux or at Clarens—not to study scenes associated with the names of Julie and St Preux, but to study the appearance and supposable comforts of an imbrowned and hard-working set of peasantry. Possibly the reader is not aware that the parish of Montreux has for several years been viewed as something of a wonder, for its small proportion of births to population; and political economists have been quite at their wits' end to ascertain the true cause of so remarkable a phenomenon. Mr Laing, in his "Notes of a Traveller," has, I think, at last struck upon the truth—which he was enabled to do, not by living in London and theorising on the case, but by residing for two successive summers on the spot, and making himself familiarly acquainted with the details of this very intricate subject. As I propose some day to present an exposition of Mr Laing's views, I need not now embarrass the present article with any observations of my own on Montreux and its industrious cottage-farming community, and shall now consider the reader conducted back to Lausanne, whence our next excursion will be to the ancient city of Geneva.

NEW YEAR'S EVE IN A PAUPER LUNATIC ASYLUM.

[From the *Athenæum*.]

Having received, and most cheerfully accepted, an invitation to accompany a friend to an evening entertainment given, on the last day of the old year, to the pauper women in the County Lunatic Asylum at Hanwell, we started from town on Friday evening, just as the dull fog had thickened over Hyde Park for the night, and after a nine miles' drive in the dark, drew up at the lighted gates of the Middlesex mad-house, gave in our names, and walked into a bright, cheerful hall, leading by white stone passages to various parts of the house. Following one of these to the apartments of the resident physician, we found that the party had already met in a room below. We accordingly retraced our steps, and after threading several other passages, came to a door which opened into the gallery where the lunatics were assembled.

The momentary impression made by the sudden change from the coolness and quiet of the empty stone passage to the heat, and hum, and bustle of a long narrow gallery, dressed out with fresh evergreens, lighted with numberless candles, and lined from end to end with three hundred and fifty restless mad women, was simply shocking; but this first impression speedily wore away, and was followed by the conviction, which every other guest must have felt before he left the room, that the generous humanity which had prompted the system of which this entertainment was only the result, had placed every one of these harmless lunatics in the possession of as much happiness as her mind was capable of enjoying.

In the middle of the long vista of frilled muslin caps, evergreens, white walls, and mad faces, down which I looked on entering, was a piano, and a crowd of dancers figuring away at country dances as mirthfully and with as good a heart as if they had been sane. We walked slowly down the room to where the dancing was going on, watched by many eyes that you saw were mad the instant you caught them. A small proportion only of the women danced; the rest sat at the sides of the gallery on benches, laughing or talking to themselves, whispering to their neighbours, lost in sad reveries, or watching earnestly and distrustfully the scene before them; and here and there a face expressive of intense melancholy, as if the poor creature were pondering on some mental misery too heavy for her to bear, called you away from the listless expression of childish imbecility which characterised the bulk of the party. A few keepers were interspersed with the dancers, who helped to give spirit to the dancing; but it was really difficult at first to say who was keeper and who was not. Every one of them seemed to enter into the enjoyment of the dance with so much good will, with so plain an intention of being amused, and so much light-heartedness, that at a little distance, and with the exception of a slovenly method of moving their feet, you might have fancied they were so many country people dancing at a village wake or fair. There was no uniform or workhouse dress to mark them as the inmates of an asylum, but nearly as much variety in their dress as in that of an equal number of villagers.

The crowd altogether reminded me very much of a crowd of children. Wilful, natural, saying what they thought, careless or unconscious of other people's opinions, earnest in trifles, sincere without concealment, inquisitive, eager observers of every passing thing, and in continual fidgetty motion, you might have imagined yourself in a school of foolish overgrown girls. There were exceptions, of course, where excessive pride or inordinate vanity was the insane indication. The Queen of the Netherlands, for instance, proud as Lucifer, looked down upon you as if you were only dirt; and her equal in purse-pride, who carried a bag of gold—foreign money, she said, but the bank would know her pebbles were good foreign money, and would pass in the country she came from—was as conscious of her wealth as the sanest money-holder on the Stock Exchange. She stalked about in her poor straw bonnet and short sorry gown with a lofty stage pride, as if she had been the original goddess of plenty. Contrasted with her pride was the silly vanity of a feeble and somewhat delicate young person, who slipped in and out between the bystanders, and walked backwards and forwards incessantly, in a stealthy self-conscious way, wishing to attract attention, yet affecting to disregard it. She had been pretty once, was better dressed than the majority about her, and, instead of the common frilled cap, she wore her hair in bands, and had less of the kitchen-maid about her than the crowd that lined the walls. She was the wife of a professional man, gone mad, one would think, with excessive vanity. Whenever you looked at her she caught your eye, looked away suddenly with a complacent smile at having attracted notice, and walked on in her vain way, as if the eyes of all were waiting upon her. I thought I detected an expression of uneasiness at her being seen among so many common people. Many of them were very loquacious, and pleased at an opportunity of talking to strangers. A placid middle aged woman, of the Mrs Nickleby genus, with a weak flow of soft religious

words, and a still weaker stream of namby-pamby, told me innocently that she had a sweet heavenly host of pretty little seraphs, three inches long, pretty little creatures, that she fed and nourished; they were up stairs now, she said, but she had been burrowing in the ground after them in the morning, which was the reason why she was not quite so well as usual. Her earnestness and minute description of particulars showed how completely she was living in a world of her own, where she saw the seraphs she described. She was fully impressed with the notion that she was sane, and that the rest of the people were mad.

The music and songs played in the course of the evening were very well received by the patients, on some of whom they produced sadness, and on others unnatural gaiety. In the middle of one of the songs, to which all were listening very quietly, an earnest, voluble woman standing behind me, to whom all things seemed possible, whispered in my ear, with an air of familiar truth which was almost startling—"You know I've been in heaven, and the songs they sing there are better than that, I can tell you." It was taking her too literally, perhaps, to follow up such an assertion by any further inquiry; but her answer to the question, "What sort of music have they there?" was rather a singular one. She considered a moment, and then said, as if she had been merely recalling past impressions—"Why, common sense, to be sure." When the song was over, she walked away towards the end of the gallery, where a few patients sat who appeared slightly more irritable than the rest; and among these was a silent, feeble girl, having a look of dejected imbecility on her sharp coarse face, which seemed as if her spirits had been broken down by want. She was one of the numerous class of patients who had been confined in that cruel bondage of restraint-chairs, sleeves, strait-waistcoats, muffs, or leg-locks (how rare it is to call things by their right names), from which the judicious humanity of the physician and the magistrates had at length released her. Her wrists were deformed by the hard leather cases in which they had been confined; and so habituated had she been to wear them at night, that for some time after they were removed, she held up her hands to be bound whenever she went to bed. Now she was permitted to wander about as she pleased; and although, under the old system, she had been tied up to an iron bar, or a bench, or a heavy restraint-chair, as a dangerous maniac, she conducted herself this evening with propriety, listened to the piano with much apparent pleasure, or sat near some friend, to whom she seemed attached, watching, with a various expression of shyness, or sadness, or apathy, every stranger's face that she saw in the room. She was not the only instance of the happy effects of removing restraint. There were forty-seven persons present, all of whom had been previously confined in some way or other, who now behaved with as much decency as the harmless patients who were always at large.

Before the dancing had ended, Dr Conolly, whose illness had prevented him from seeing his patients for some time previously, and who, for the same reason, was unable to join the party earlier, made his appearance in the gallery, and went through it, noticing nearly every person as he passed with some appropriate kindness. I have never witnessed before so affecting a tribute to unassuming genius and worth as was paid by these pauper lunatics to their resident physician. With few exceptions, the women rose as soon as they saw him, and eagerly stepped out from their seats to shake hands with him, and ask him how he was, hoping that he was better, and wishing him a happy new year. Wherever he went, there was some proof of their respectful affection for him, if not in words at least in manner, or by voice or look, or by the cheerfulness caused by his merely coming among them; the sympathising courtesy with which they were received seemed to rejoice them no less than hearing he was better. "What a treat it is," I heard a hearty old woman whisper to her neighbour, when he was out of hearing, "to see the doctor about again!" and the same feeling was expressed in the faces of nearly all. It may well be conceived that so many marks of sincere regard in these helpless lunatics, joined with the ready tact and quiet forbearance which Dr Conolly showed with uncertain tempers, his cheerful familiarity with those who required encouragement, his courteous deference to mad vagaries, sympathy with whimsical complaints, gentleness and firmness where they were needed, and his friendly sincerity with all, were not seen without emotion; while, at the same time, it afforded the plainest proof of the wisdom and humanity of the present system of treatment at Hanwell, when carried out by such an instrument.

At nine o'clock the evening hymn was sung by all who chose to join, and the party broke up, with no other interruption than the loud sobs of one poor soul, who left the room crying like a great baby for "her doll." When the signal was given to go to bed, the women left the room as obediently as children, shaking hands and wishing good-night with much simplicity. Among the last to go was a poor Irish girl, who interested me exceedingly. She was a fine hearty creature, with a full round Irish face, a brogue, and soft mild eyes, which, while she smiled to herself, seemed full of wilful gaiety, and then, on a sudden, became very sorrowful, as if her mind were filled with some painful recollection far removed from the place or circumstances about her. She was an uncertain patient, it seemed, and occasionally became refractory; but to-night she was only in unnaturally high spirits, dashed with these sudden fits of sadness. When we were going away, she called out loudly, "Edward! Edward!" as if she expected him to come. She was supposed to have been the bride of a soldier who had married and then deserted her. She said, with inexpressible pathos, while a song was singing near her, "I had rather hear Edward play the guitar, than sit under a canopy of gold and have ten thousand a-year."

I find a difficulty in expressing what I felt on leaving this singular scene. Here were three hundred and fifty mad women, of whom perhaps no less than three hundred were incurably mad, having temper and dispositions requiring the most constant and rigid self-restraint to treat with proper forbearance, in some cases impatient of all restraint, listless spendthrifts of their time, or lazy and indifferent to the common every-day necessities of life, without the means or disposition of earning a subsistence, and either without friends or lost to them, or alienated from them by a malady worse than death, who were treated with a kindness and concern which they would not have met with, and perhaps could scarcely have expected, from their own kinsmen and friends. Instead of harshness, they find a charity which "suffers long and is kind:" where imprisonment and violence were once thought necessary, liberty with firmness, or with merely occasional seclusion, is all that is required; and apart from the melancholy incidents which must necessarily follow a pauper lunatic into an asylum, you find these forsaken people in the comfortable enjoyment of as large a measure of happiness as will ever be found consistent with their demented state. It must, indeed, have been a gratifying reflection to the men who have planned and are carrying out the scheme of benevolence which has already been followed by such results, that to their courageous perseverance and enlightened charity are these benefits to be attributed. Their services are *not* confined to Middlesex and Hanwell; they are trying a great experiment for the nation, in devotion to which a life would not be misspent; and the issue of that experiment will be, that at no very distant day a law will be passed making all restraints in every mad-house in the kingdom as illegal as they have been already proved to be mischievous and unjust.

DAGUERREOTYPE PORTRAITS AT THE ADELAIDE GALLERY.

It seemed sufficiently wonderful to have one's "portrait in little" limned by the sun in a few seconds; but now it is done instantaneously; a passing expression is transferred to a plate, and the "Cynthia of the minute"—or rather of the *moment*—is caught and clapped into a case in no time. This magical celerity in taking photographic likenesses by the Daguerreotype at the Adelaide Gallery, is the result of some improvement in the process recently made by M. Claudet, who has also greatly improved the pictorial effect of the miniatures, by the introduction of backgrounds: and he adopts a method of fixing the image peculiar to himself. The momentary quickness with which the likeness is taken prevents the necessity for retaining a fixed look and posture for a certain time: this is not only more agreeable to the sitter, but gives a life-like ease and vivacity to the photographic portraits: thus, the objections made to their stern and gloomy expression are obviated in a great degree; the most transient smile being reflected in the polished surface of the plate as in a mirror. The addition of a background of trees, architecture, or a library, takes away from the metallic effect of the plate, and gives to the miniature the appearance of an exquisitely finished mezzotint engraving seen through the wrong end of an opera-glass. This addition is made by simply placing a scene, painted in distemper in neutral tint, behind the sitter, and arranging the focus of the lens of the camera so that the upper part of the figure is shown: by diminishing the size of the head, the defects arising from an exaggeration of facial peculiarities are got rid of, and the salient points of the physiognomy are, as it were, concentrated: the fixing process, too, imparts a warm brownish tinge to the miniature, substituting the tone of a sepia drawing for the livid coldness of the metallic surface. The roof of the Adelaide Gallery is the scene of these operations, on which a chamber glazed with blue glass is erected, for use in cold and rainy weather: when it is fine, the sitter is placed in the open air under an awning, to screen the face from the glare of sunlight. Waiting your turn, and whiling away the time by trying to discern distant objects through the smoke, or looking at the steeple of St Martin's Church, that rises in bold relief before you, a courteous person invites your attention to a little square box that he holds, and placing it on a stand directly opposite to you, begs you to remain steady for an instant. He lifts up the little dark curtain that veils one side of the cube-shaped box, and lets it drop directly; you suppose there is something wrong—not at all—the thing is done; whatever your look was at that moment, it is transfixed on the plate; and you may go to the little laboratory where the process of "fixing" is performed, and, as the moisture of the preparation is evaporated from the surface, see what was the precise expression on your face at the time. There is your image, as though a diminishing glass had perpetuated the reflection—only without colour. But what a hand! surely you have not got such a huge fist: no; you happened to thrust it forward before the plane of the picture, and hence it has been taken under a different angle. You don't like to present a portrait with such a fist to the fair one to whom you have offered your hand; and you hesitate, though the likeness is so striking: M. Claudet perceives your embarrassment, and anticipating the objection, says, "Let us try again, if you please;" and the operation is repeated—ay, and a third time, if any accidental failure renders it necessary. Should you prefer it, a friend may share the operation; and at the same moment both phizzes will be transferred to the plate: we saw a loving couple taken in this way, nay, even groups of three; you may have a whole family enclosed in a couple of miniatures. The small size of the heads does not diminish the likeness: you might have a set of shirt-studs ornamented with portraits of your friends.—*Spectator*, *April* 16.

QUALITIES OF BAD PAPER.

In order to increase the weight of printing paper, some manufacturers are in the habit of mixing sulphate of lime, or gypsum, with the rag to a great extent. I have been informed, by an authority upon which I place great reliance, that some paper contains more than one-fourth of its weight of gypsum; and I lately examined a sample, which had the appearance of good paper, that contained about 12 per cent. The mode of detecting this fraud is exceedingly simple; burn 100 grains, or any given weight of the paper, in a platina or earthen crucible, and continue the heat until the residuum becomes white, which it will readily do if the paper is mixed with gypsum. It is certainly true that all paper contains a small quantity of incombustible matter, derived from accidental impurities, but it does not amount to more than about 1 per cent.; the weight, then, will indicate the extent of the fraud. Brande, the professor just quoted, also mentions a circumstance of a Birmingham button-maker, who had a large quantity of newly made buttons so much tarnished as to be unsaleable; and upon examining into the cause, it was found to be owing to there being left in the paper in which the buttons were wrapped up a considerable quantity of chlorine, or oxymuriatic acid, which is used in the bleaching. There are very few goods that would not be injured by the action of chlorine. A coloured paper manufacturer would find it difficult to fix any vegetable colour upon paper so impregnated, and the loss to him might be very serious. Great caution is therefore necessary in the purchasing of paper for such purpose.—*Magazine of Science.*

MUSTARD—WHITE AND BLACK.

The seeds of these indigenous annuals which have of late years attained such celebrity as a condiment, have been cultivated throughout Europe for an unknown period. The French call the plant *sénevé*, and confine the term *moutarde* to prepared table-mustard. Mustard, moutarde, mosterd, &c., are said to be all contracted corruptions of *mustum ardens* (hot must), the sweet must of new wine being one of the old ingredients in mustard prepared for dietetic uses, a practice still adhered to by the French. In moistening mustard powder for the table, both the flavour and appearance are improved by mixing with it rich milk; but this has the disadvantage of not keeping good for more than a couple of days. Professor Brande states, that what is usually sold as Durham mustard, is a compound of a little mustard seed, Cayenne pepper, wheat flour, and turmeric. According to a late analysis, both the yellow and brown mustard seeds contain indiscriminately, 1st, a soft fixed oil of a dark-greenish colour; 2d, a yellow volatile oil, on which depends the pungency; 3d, an albuminous vegetable principle; 4th, much mucilage; 5th, sulphur; 6th, nitrogen; and lately, Henry and Garot have discovered a peculiar acid, which they have named sulpho-sinapic acid; and hence is accounted for the reason of genuine mustard requiring to be made a few hours previous to use, in order that these principles may react on each other, and acquire the pungency and flavour which characterise good mustard, and serve to distinguish it from all those spurious articles sold under the name of mustard. Independent of its valuable properties as a condiment, it has been used as a remedial agent in many diseases from the remotest period. The great Boerhaave relates the case of a girl at Amsterdam, who, after taking a variety of medicines for chorea (St Vitus's dance), was at last restored to perfect health by the seeds of the white mustard (our common yellow mustard); and the same learned author states, that he found it an invaluable remedy in obstructions of the liver, indigestion, dropsy, and various other diseases. Its external use as a cataplasm to the feet, in determination of blood to the head, is so well known, as not to require any particular notice.—*Burnett's Outlines of Botany.*

TAKING CARE OF JUPITER.

The first consideration with a knave is how to help himself, and the second, how to do it with an appearance of helping you. Dionysius the tyrant stripped the statue of Jupiter Olympius of a robe of massy gold, and substituted a cloak of wool, saying, "Gold is too cold in winter, and too heavy in summer. It behoves us *to take care of Jupiter.*"—*Lacon.*

BANKING GENEALOGY.

Apropos of Sir J. Child, I have to remark, that he founded the firm which still retains his name at Temple Bar, and which, with the house of Willis, Percival, and Co., is considered to be about the oldest in London. Child's house is understood to possess documents which prove their existence as a bank as early as 1663, since which they have never moved out of the same premises. The books of Messrs Hoare, in Fleet Street, are said to go back to 1680; and those of Messrs Snow, in the Strand, to 1685. Stone, Martins, and Stone, of Lombard Street, claim to represent the house of Sir T. Gresham; but this, I presume, must be more a matter of tradition than of documentary evidence, and is principally noticeable as suggesting views of ancient descent upon the part of our commercial interests, which will bear a comparison with the genealogy of many noble houses.—*Banks and Bankers.*

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row.

Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 540. SATURDAY, JUNE 4, 1842. PRICE 1½d.

THE COUNTRY BELLE AND LONDON COQUETTE.

THE parsonage house of Farnley, with its tastefully arranged though not extensive grounds, was in one of the prettiest spots imaginable. Situated on a gentle acclivity, it overlooked a valley through which, like a silver thread in a serpentine path, flowed a certain river, which, as yet near its parent spring, seemed an emblem of infancy, alike unconscious of its growing strength and majesty, and of the storms that would fret and agitate its pure waters on a nearer approach to the ocean. Already, however, the merchant's barge, the ferry boat, or the pleasure yacht, floated on its calm surface; and the white sails of the last, gleaming between the varied blossoms of luxuriant fruit-trees, declared the river's course far beyond the point at which it might otherwise have been discernible. The horizon was bounded by a line of noble hills, while on the other side the spires of a market town, and several hamlets and villages, might, with a good eye, be traced with accuracy and distinctness. Adjoining to the parsonage was the village church, venerable both from its age and associations; in a word, the scene was thoroughly English: and Helen Morden, the vicar's daughter, might have been taken for the presiding deity of the place. It was one of those early summer days into which the freshness of spring had but just melted, when the odour of flowers, and the song of birds, and the brightness of sunshine, have yet the charm of novelty, in addition to their own sweet spell. Helen was seated on a rustic bench, shaded by the waving branches of a sycamore. A book was in her hand; but though a finger was between the leaves, it rested on her lap; her eyes were fixed on some distant object; but the mind was either conjuring, creating, a future, or looking back on the stores of memory. Ah! Helen, Helen, it was vain to think the fairy bird would entrance you now. A few months since, even so lately as when the Christmas log blazed upon the hearth, your bright intellect, unrusted by the breath of passion, might have roved delighted with the grand and gorgeous but unreal Spenser. But now you feel that his creations are not your fellow-mortals, but incarnations of abstract qualities—pure, great, beautiful, but marble cold. Still, the presence of love, the "unbidden guest," was as yet scarcely recognised by herself, though, in truth, he was there; and the fluttering of his wing it was that agitated her soul, that taught her imagination to wander in strange day-dreams, and that initiated her untried spirit in many mysteries of the human heart. And still her favourite volume remained in her hand unread.

The reverie of Helen Morden was disturbed by the quick step of her cousin, who had been for a few weeks a visiter at Farnley. There is no accounting for taste in matters of beauty. Some people greatly preferred Clara's *petite* figure and sparkling black eyes, to the deep blue orbs and the rich brown hair of her cousin; while others wondered that any one could look at such a little gipsy when the fair and dignified Helen was near. There is no accounting for tastes; and fortunate it is that they so much vary.

"Well, dear Clara, have you read all your letters? What news from London?" exclaimed Helen, as her cousin approached.

"A great deal too much."

"Too much! Why, I thought you measured your happiness by the number of letters you received from the gay metropolis; and you have declared breakfast the only endurable meal in the country, because then the post comes in."

"Don't teaze me, Helen."

"My dear Clara, what is the matter?"

"Do you want to know?"

"Not from idle curiosity; but if I can be of any service to you, pray tell me."

"I have been cheated—duped," rejoined the London lady. Then, after a pause, she continued—"I daresay, if the truth were told, you know perfectly well why my managing mamma sent me down here; for I know it was her doing that my uncle, your papa, invited me. To be sure, I have greatly enlarged my mind and added to my acquirements during the last month. I actually can distinguish a horse-chestnut from an apple tree, and I don't think I ever should mistake a goose for a turkey again. However, it was to forget instead of to learn that I was sent away; but you don't suppose, if I had really cared two pins about Captain Lennox, that I should have submitted so quietly—do you?"

"As you have never made me your confidant, Clara, I really know very little about the affair; but I understood your mamma was apprehensive you had formed an attachment of which she could not approve."

"And so enticed me out of the way till Henry Lennox's regiment had embarked for the West Indies, where, I daresay, he'll die of the yellow fever; but I shall not go into mourning if he does. Helen, you are such an inexperienced, prim, prudish ignoramus, that you will hardly understand what my plans were, if I explain them to you."

Helen smiled, in acknowledgment of the compliment, but repeated the word "plans" in a tone of interrogation. This was encouragement enough for the "London coquette," who really wished to unburden her mind; and she proceeded, beating her pretty little foot upon the gravel, to the evident detriment of a delicate and very inappropriate silk slipper, and—when she had seated herself beside Helen—twirling and furling her parasol with a gesture more indicative of ill temper than of very profound grief.

"I really did *like* Frederick Seymour; and, besides, there is only a puny child between himself and a baronetcy, and he is very rich already; and he is so handsome, and he drives such loves of horses; I could cry with vexation—that I could. He is going to be married to a demure little chit that nobody noticed. I have seen her sit out three quadrilles following—that I have; and all the while that he seemed desperately in love with me, and that I was trying to pique him by my flirtation with Henry Lennox, he was absolutely engaged to the odious little wretch, and concealing it only till he could obtain his uncle's consent to the marriage; for she is a nobody, and has not a farthing in the world. It is all arranged: the stupid old uncle is to give her away, and her future mother-in-law has taken a vast fancy to her, and presented her already with some of the family jewels. If he had married for money or rank, I should not have cared, because nobody would have believed it a love-match, and I should perhaps have had the credit of breaking his heart and driving him to desperation; but to think of my being cheated, duped, and buried here, while this fine scheme was hatching, is almost more than I can endure. But I'll be revenged. I'll marry some rich old man, and have a finer house and *as* stylish a carriage as Mrs Frederick Seymour."

Clara Frampton was almost out of breath, but she kept on a sort of running, though very independent, accompaniment to the warblings of a neighbouring blackbird. Helen was dumb from astonishment; her cousin's discourse was scarcely more intelligible to her than an unknown language would have been; and yet, by instinct, rather than any effort of reasoning, she felt that Clara's narration—confidence *she* called it—so far from enlisting her sympathies, had placed a gulf between them. We have hinted that to the pure, truthful, artless Helen, love was not unknown; nay, deeply, lastingly, had the sentiment taken root in her heart, and yet was it there,

"Like the last pale leaf in the rose-bud curl'd."

Never yet to the nearest and dearest had it found expression in words; there was profanation in the very thought; for *he* had not yet spoken his love in that prosaic but simple and satisfactory phrase, "Will you marry me?" And we must here digress to dwell for a moment on a somewhat delicate point.

Frank Staunton was worthy of the prize he had won—the heart of Helen Morden. He was the soul of truth and honour, but *perhaps* he erred in judgment when he refrained from uttering that same prosaic sentence; he might guard his lips from its delivery, but they spoke words more searching—more passionate. Oh! not unwooed, not lightly, had sweet Helen Morden been won; for many long months had every look, every word, every gesture, proclaimed the truth, "I love you;" and yet those words were unspoken; for Helen was portionless, and Frank was as yet too poor to marry. His prospects, however, were good; for he had studied for the bar, and was rapidly coming into notice, when a serious illness, brought on, it was said, by over-exertion, had so injured his constitution, that studies and mental occupations were prohibited, and he was recommended a quiet sojourn in the neighbourhood of Farnley. Thrown frequently into the society of the vicar's daughter, what could he do but love her? And he did love her as a high-minded man only can love; and when, with recovered health, he left the spot in which the poetry of his life was centred, the hope, the thought that she might be his, was the spur which henceforth urged him to exertion. Although his heart yearned for some sweet confession from her lips, his code of honour forbade him to seek it; and with an inconsistency, strange, yet frequent, he strove one moment to conjure to his memory every faint blush or kind word he could interpret in his favour, and the next to persuade himself that he had refrained from intimating his own feelings to her. In his defence, if a defence be needed, it must be owned he was not a vain man; and did not, like too many of his sex, fancy that every woman to whom he was tolerably civil must necessarily fall in love with him. If each had *known* how truly the other loved, how much of sorrow they might have been spared! Need we repeat, there could be no sympathy between the cousins?

We will own to a prejudice. We have an antipathy to a coquette; to be sure, there are different shades which distinguish the character—many species of the *genus*—but we have a suspicion that they are all destitute of genuine feeling, and abominably selfish and conceited; in short, we look upon only one creature as more detestable, and that is—a *male* flirt. Perhaps, however, one's ire might sink into contempt, if true coquettes were not mischievous as well as detestable; and it is to paint one phase of their sphere of action that this sketch is penned.

A year passed away; again is the earth gemmed with flowers—again is it bright spring. But the scene is no longer the pretty garden of Farnley, but a ball-room in London. Helen is on a visit to her cousin, tempted, by the wishes of many friends, to pass a "season" in the gay metropolis. She is more beautiful than before, for her mind has expanded, and her feelings have grown more intense, and their language is revealed in her countenance. She has met Frank

Staunton again, and her reason, as well as her heart, tells her she is beloved. "The world," too, has guessed shrewdly at their secret, though *still* it is unconfessed. A year had passed away, and Clara's "threat" or "promise" was unfulfilled. She was not yet married either to old or young, rich or poor; it is true, in that year she had had more flirtations than she could count, but still she was unmarried—unengaged. On the evening in question, which was passed at the house of rather a new acquaintance, she was decidedly out of temper. She was surprised at the notice her "country cousin" received, and disappointed that none of her own especial admirers were present. Helen was dancing, and *she* actually unprovided with a partner, when Frank Staunton arrived. He addressed himself to her, but she perceived where his eyes were wandering, and felt convinced that a bold stroke would be necessary to accomplish her scheme. It must be observed that, previously to Helen's arrival in town, Frank Staunton and Clara had become intimate, though, in fact, he had sought her society solely because her family was the only one in London where Helen was known and talked of with which he was acquainted. To sit out another dance was to Clara a sort of degradation or disgrace, which to think of was terrible, and yet the event seemed far from improbable. The truth was, there had been many disappointments; and though the party had not yet all assembled, the fair sex predominated. While Clara was pondering on such sad mismanagement, and looking almost ugly from ill temper, Sir Frederick and Lady Seymour arrived, the latter magnificently dressed; and notwithstanding Clara's former animadversions, this some-time "demure little chit" seemed now the queen of the room. They passed her with a bow; and, grown desperate lest they should see her for a moment neglected, she determined, at any risk, to keep Staunton by her side—at least until she could provide herself with another swain. The dance was just concluding, and she knew that a waltz would follow; if the band would but strike up at that moment, the game was in her hands; but the minutes that would intervene might be fatal, for she was well assured that Frank would seek her cousin the moment she was released. But when was a coquette ever at fault?

"Mr Staunton, do hold my gloves while I fasten this bracelet. No, you can't manage it; it is a most tiresome clasp." Of course there was nothing the matter with the clasp; but, at the price of breaking two perfect links, she kept Frank by her side until the waltz was played.

"Oh! that beautiful waltz; and I know no one here that will ask me to join in it. I think I shall stand up with a chair if no one does."

Could a gentleman resist so palpable a hint? Impossible; and of course the next minute they were among the giddy throng. Clara waltzed beautifully, and cared little how she had procured one of the best partners in the room. The vicar's daughter did not waltz, but she wondered that Frank Staunton had been so long in the room without speaking to her.

A ball-room has been compared to a field of battle, and really there are many points of resemblance. Fatal wounds are inflicted (by bright eyes), and decisive conquests are made. There are often sharp encounters (of wit and argument), and sometimes a running fire (of compliments); but the great point of resemblance consists in the fact, that the most important and occupied individuals in the *melée* are the least competent of all to give an account of the entire action, though they can describe very accurately their own evolutions. It is the looker-on, or the calm after-judge, who can best determine where the wave of one event touched upon the curve of another. Thus, Helen Morden's account of the evening would be briefly but clearly given somewhat in the following manner:—High hope and expectation of seeing and talking with Frank Staunton; a slight pang of jealousy at his close attendance on her cousin, followed by a rapid course of reasoning, which made her half-ashamed of the unworthy feeling; an animated intellectual conversation with an agreeable, but extremely plain and even deformed, person; and then a sharp pang of regret, that, when Frank Staunton did approach and ask her hand for the dance, she was pre-engaged, and hurried from him by her partner; then a wild beating at her heart as she observed the changes of his expressive countenance while he again discoursed with Clara. And afterwards, when he once more approached her, the consciousness that both were embarrassed; when they separated, her hand so trembled, that she could not give it with her accustomed frankness—and the waking hours, already extended, were yet to be, for her, prolonged; the morning sun was high in the heavens, and still poor Helen's aching temples throbbed upon a pillow wetted with her tears.

Frank Staunton was nearly, if not quite, as wretched. With Clara on his arm, he had overheard *a part* of the conversation between Helen and Mr Railton, which the coquette had dexterously distorted to further her own plans. Perhaps he was absolutely less jealous than diffident of his own merit (true love is never over-confident); and when Clara told him (the truth) that Mr Railton greatly admired Helen, he could not, for a moment, wonder at his taste; but when she hinted that, in consideration of his great wealth, her cousin might be inclined to overlook his age and unfortunate appearance, he defended her quickly and warmly. Clara was getting out of her depth, but there was a plank near, so she alluded to Mr Railton's talents and amiable qualities, and felt comparatively safe when she marked that Frank Staunton's countenance fell, and that there was scarcely a rejoinder. The real coquette—the cold-hearted selfish woman, such as we have known and are endeavouring to describe, whose deity is SELF, and at whose altar at first the trifling comforts, and by degrees the most vital interests, of every other human being may be sacrificed without regret—can never be very particular in the delicate matter of *truth*, and therefore it was quite natural that Clara should assert her belief that Helen was attached to Mr Railton. "Both were embarrassed" when, later in the evening, Frank and Helen conversed; and his was a common error, in mistaking timidity for coldness. The buckler of dark leaves which adds to its beauty, and shelters the blue violet from many a storm, also hides it from the careless observer; and just such a flower, with the shield of modesty, was sweet Helen Morden: who but a cold coquette could have had the heart to injure her?

Clara's scheme, aided in some measure by the circumstance of Helen's sudden recal to Farnley, partly succeeded. By some further manœuvring and misrepresentation, she *de*tached Frank Staunton from the hope and endeavour of winning her cousin, but she signally failed in *at*taching him to herself.

Perhaps there is no period of life in which the rapid flight of time, and the strange revolutions it brings about, are so keenly felt, as well as observed, as in youth; or rather during the first years when, leaving early youth behind, we mix in the world as men and women. It seems probable, that, to those whose lives are greatly prolonged, it must seem perfectly natural for the younger and stronger to fall into the grave before them, or to witness and participate in the strange revolutions of fortune's wheel. But, on the minds of the young, proportionally narrower as their scope of observation must be, these things make a lasting impression, teaching them, if the seed fall on good ground, a wisdom deeper than the wisdom of books; and making, in fact, the difference between the boy and the man, the girl and the woman. We left Helen Morden a girl, overwhelmed by her first real grief, shedding the first bitter tears wrung from the heart's agony: we take up her story three years later, when the ordeal was passed—when she was a feeling, thinking, but still pure and high-minded woman.

Helen's sudden return to Farnley was occasioned by the illness of her only parent, her father; and long and anxiously did she watch by his sick-bed. After a while he rallied, and even recovered sufficiently to resume for a few weeks his accustomed duties; but his constitution was impaired, and in less than a year Helen was an orphan. Mr Morden had no private fortune, and his living had not been a lucrative one; had he been spared a few years longer, his daughter might perhaps have inherited a competence; as it was, his savings only amounted to about three hundred pounds—a sum very acceptable as a resource in any future emergency, but of course quite inadequate as a permanent provision. There is a great deal of good feeling in the world (let a certain set of silly people abuse human nature as they will), and many were the kind friends who offered Helen assistance and protection in her affliction. She, however, had the good sense and the right pride to determine, by her own exertions, to be independent. Only, therefore, till she should have recovered a little from the shock of her father's death, and could procure a situation as governess, did she avail herself of a friend's invitation. That friend was Mr Railton's sister, with whom she had lately become intimate, and whose home, for many reasons, she preferred to that of her relatives in London. For nearly a twelvemonth did she remain under that hospitable roof, and left it at last, much against the wish of her hostess, to fulfil an engagement she had made in a family residing within thirty miles of London.

To the "coquette," three years passed in the terrible monotony of dissipation; for a course of what is called "gaiety" is about the most wearying occupation under the sun. To her own great surprise she was still unmarried; not that her flirtations had been "few or far between," for she had grown less exclusive than formerly; and even Captain Lennox, who, instead of dying of the yellow fever, had returned home with a yellow face, was now looked upon as an "eligible" person. He certainly had a sincere regard for her; and though the tear and wear of three London seasons, and as many visits to some racketing watering-place, had considerably dimmed her youthful beauty, he was certainly more attentive than ever. Latterly, too, Clara's manner had become subdued in his presence; though, whether such a coquette had really a heart to be touched, or that she was only anxious not to lose a last lingering "chance," is a problem not easily solved. With regard to poor Frank Staunton, Clara had found many opportunities in which, for her own pride's sake, to keep up the deception she had practised. The circumstance of Helen's visit to Mr Railton's sister she considered a most lucky event; and certainly, in the light in which she placed it, there was "confirmation strong" of all she had previously declared. Still, as time passed on, and more especially when he heard, many months after it occurred, that Helen Morden had commenced her duties as an instructress, he had some misgivings that he had judged her rashly. Fanned occasionally by the breath of hope, a love never extinguished seemed at intervals to illumine his heart; and though his profession, in which he was now actively employed, engrossed the chief energies of his mind, he had yet time to indulge in a little castle-building, and frame some plan for renewing his acquaintance with Helen Morden. Evil machinations have but a limited rule; and TRUTH was gradually asserting its enduring power, when an event, awful even to Clara Frampton, brought about the catastrophe.

It appeared that Clara had been the subject of conversation at a party where Captain Lennox was present; her coquetry had given rise to expressions not altogether respectful, and he, indignant at the remarks which were made, warmly resented them. The party consisted chiefly of military men, among whom a certain code of honour is more than tolerated. The dispute became personal, and a challenge was the result. Alas! in this Christian land, when will men learn to fear God more than the hollow frivolous reasoning of their fellow-men? When will strong opinion be loud and visible enough to chase crime from companionship with honour, and point to the duellist as a murderer?

Captain Lennox was mortally wounded, but lived long enough to send for Clara Frampton, avow his cherished love, and die in her arms. By this bitter and agonising trial, the better feelings of her nature at last were touched; the only man who had ever loved her, died defending her from insults she had brought on herself. It was when a burst of passionate tears had subsided into silent but deeper grief, that Clara Frampton hung over that narrow coffin, and *prayed* for power to amend her own faults. With repentance came the desire to atone, wherever it was possible; and the very day of the funeral, dressed in the mourning garb she *did* assume, she sent for Frank Staunton, and confessed the wicked deception she had practised. The generous know how to forgive, and he could not refuse his pardon to the penitent before him. She offered to repeat her confession to Helen; but whether he was willing at that moment to spare the wretched Clara any farther distress, or was actuated by more selfish feelings, we will not decide. All we know is, that, without an hour's delay, he mounted his horse, and rode in the direction of D——. He soon discovered the manor-house where Helen was domiciled, and by a silver "open sesame," found means to convey a note to her seeking an interview. A visiter to "the governess" was a most unusual event; and, in the shape of a very handsome aristocratic-looking personage of the other sex, was looked upon as a marvel. The children stared, and the servants smiled, and Helen trembled and turned pale. Is there need to go on, or to hint even how now and for ever Helen was to his heart and soul the embodiment of the most beautiful "idea" of which the human mind is capable—TRUTH. They have been married for years, and the poetry of life is still theirs, made real and substantial by those worldly blessings they so well deserve. Mr Railton, too, must not be forgotten. Instead of a lover, he has proved himself something rarer—a friend; and as he has now no near relations, it is thought Frank Staunton's children will inherit the bulk of his fortune.

GLACIERS—ASCENT OF THE JUNGFRAU.

THE icy coverings of the Alps have lately become the subject of new interest, in consequence of their appearing likely to afford some satisfactory information with regard to certain stony and earthy deposits on the surface of the earth, and particularly with regard to the existence of large boulders or detached masses of stone at great distances from the mountains, to which it is evident, from their material, that they have originally belonged. We do not here require to go into the particulars of what is now called the *Glacier Theory* of these deposits, for it has already been stated pretty fully in our columns. We only propose, on the present occasion, to direct attention to an able view of the constitution and whole phenomena of glaciers, which appears in the 151st number of the *Edinburgh Review*, and to an account of the recent ascent of the Jungfrau, presented in an equally recent number of the *Edinburgh New Philosophical Journal*. The first of these papers is by Professor Forbes of Edinburgh—a youthful cultivator of science, remarkable for a singular activity of intellect, united to an extraordinary solidity and extent of knowledge. The second is by M. Desor, a young German naturalist.

The constitution of the ice-covering of an Alpine region, snowy and porous near the top, and more hard and condensed farther down—the constant movement of each section of this covering, down through its own hollow in the sides of the mountainous territory (such section being in fact a glacier)—the fissures or *crevasses* into which the glacier is broken—the collection of broken rock which it brings along on its surface—and the grinding and polishing effect which it has on the rock below—all these matters are fully treated by Professor Forbes, who, however, throws great doubt on the various explanations which have as yet been given as to the cause and manner of the movement. Of its character as a fact there can be no doubt, after what has been observed. For instance, a hut, reared by an investigator named Hugi, in 1827, at the foot of a particular height, was found three years after several hundred feet down the slope; six years later, it had moved in all 2200 feet. In 1839, Professor

Agassiz ascertained that this distance had in the interval been exactly doubled. It is also stated, that the ladder left at a particular spot by M. Saussure, in 1788, was found in fragments a few years ago several leagues below its original station. Mr Forbes therefore regards a glacier bearing stones on its surface as a kind of chronological chart. "It is an endless scroll, a stream of time, upon whose stainless ground is engraven the succession of events, whose dates far transcend the memory of living man. Assuming, roughly, the length of a glacier to be twenty miles (no uncommon case), and the velocity of its progression (assumed uniform) one-tenth of a mile, or 500 feet per annum, the block which is *now* being discharged from its inferior surface on the terminal moraine may have started from its rocky origin *two centuries* ago! The glacier history of 200 years is revealed in the interval, and a block ten times the volume of the greatest of the Egyptian monoliths, which has just commenced its march, will see out the course of six generations of men ere its pilgrimage, too, be accomplished, and it is laid low and motionless in the common grave of its predecessors."

Far up amongst the icy solitudes, the leaves of the trees which grow upon the plain many miles off, are found here and there resting in little hollows on the surface, having been driven thither by the violent winds which prevail at some seasons in those regions. In similar little hollows, "living animals are often found—small black insects which inhabit the snow or ice-cold water, and there propagate their species." It will be found afterwards, that on the few patches of bare rock at the summits of these lofty mountains, many miles from every other specimen of living vegetation, a few lichens are found growing. One remarkable feature of the glacier world is beautifully described by Professor Forbes. The surface, it appears, is almost every where seamed with the channels of little rills, the result of the partial melting produced during the day in summer. "These rills combine and unite into larger streams, which assume sometimes the velocity and volume of a common mill-race. They run in icy channels excavated by themselves; and, unlike the water escaping from *beneath* the glacier, being of exquisite purity, they are both beautiful and refreshing. They seldom, however, pursue their uninterrupted course very far, but reaching some *crevasse*, or cavity in the glacier, mechanically formed during its motion, they are precipitated in bold cascades into its icy bowels, there, in all probability, to augment the flood which issues from its lower termination. Nothing is more striking than the contrast which day and night produce in the superficial drainage of the glacier. No sooner is the sun set, than the rapid chill of evening, reducing the temperature of the air to the freezing point, or lower—the nocturnal radiation at the same time violently cooling the surface—the glacier life seems to lie torpid; the sparkling rills shrink and come to nothing; their gushing murmurs and the roar of their waterfalls gradually subside; and by the time that the ruddy tints have quitted the higher hill-tops, a death-like silence reigns amidst these untenanted wilds."

The Jungfrau is one of the loftiest and most conspicuous peaks of the Alps of Berne, and, till 1841, it had never been for certain ascended by any but a small party of guides. In the autumn of that year, Professor Agassiz, the eminent naturalist of Neufchatel, Professor Forbes, Professor Heath of Cambridge, and M. Desor, spent some weeks in exploring these wilds, when it suddenly occurred to them to make an attempt to ascend the Jungfrau. In this project they were encouraged by their guides, and the party was quickly reinforced by other two gentlemen, M. du Châtelier of Nantes, and M. Pury of Neufchatel, a student of theology. Their guides were of equal number, the principal being one of uncommon experience and sagacity, named Jacob Leuthold. Starting from the hospice of the Grimsel, they spent the first night at some chalets, or shepherd's lodges, at Moeril, at the head of the Valais, 6000 feet above the level of the sea. We must pass over the whole of this day's journey, excepting one extraordinary object. In descending some smooth fields of snow which stretch towards the Valais, they observed some small openings, which proved to be skylights in the roofs of a series of large chambers in the ice. In these they found an azure light of the most surprising transparency, beauty, and softness, being a reflection from the crystalline walls of the interior.

It was their intention to start about three in the morning, but they were detained two hours for a ladder, which they had to send for to some distance. A ladder is necessary in such expeditions, to serve as a bridge across fissures or rents in the ice. The morning proved extremely favourable, but owing to anxiety about the ladder, some of them had enjoyed no sleep during the night. When all were prepared, the leading guide, Jacob, called them all around him, and harangued them in the following terms:—"We should have set out at three o'clock; it is now five: these two hours we must make up on the plain of the glacier. Let us, therefore, advance at a quickened pace; those who do not feel strong enough to follow me must remain behind, for we will wait for no one." A leading guide, it appears, becomes in such circumstances a man of some authority. All professed to be eager for the expedition. They ascended to the glacier of Aletsch. To continue, in the words of M. Desor—"It is reckoned six leagues from the place where we mounted the glacier to the point where the ascent becomes steep; but we were so influenced by Jacob's exhortation, that we accomplished the distance in less than four hours. We arrived at half-past nine at the snow-fields, which commence with the ascent. It was here that we made our first halt, at a place which we called the Repose, because the passage we had made, and the immense heights which rose in stages in front of us, naturally invited us to take some refreshment. The Repose is one of the most beautiful situations on a glacier that can possibly be met with. We here find ourselves in front of an immense amphitheatre, in which five great confluent branches of the glacier of the Aletsch become confounded with each other. Two of the most considerable of these occupy the background. They descend, one from the sides of the Jungfrau—and it is this which many travellers name the Glacier of the Jungfrau—and the other from the summit of Mönch. To the west of the Repose, on our left, a vast hollow ran downwards between the Jungfrau and Kranzberg, and in this we distinguished a series of terraces rising one above another: it was by this we were to ascend.

We left at the Repose the greater part of our provisions, carrying with us only a little bread and wine, some meteorological instruments, and articles of different kinds; among others, a ladder, a hatchet to cut steps, and a cord to tie us together. It was ten o'clock when we set foot upon the first plateau of snow; an hour after mid-day, we hoped to be on the summit, if no accident occurred; some of us even thought that we should reach it in two hours. Contrary to our expectations, we at first found the snow not in a very favourable state; it was neither sufficiently compact, nor covered with a crust thick enough to bear us, so that we sunk very deep, in many places up to the knee. We soon came to the fissures, which are every where frequent where the declivities begin to become steep. We saw some of them here nearly one hundred feet wide, but they were not very continuous, so that we were able to go round them; or else they were masked, and in that case our guides had to use the greatest caution to guard us from danger. On this account we advanced much less quickly than we wished, and, in spite of all precautions, many of us sunk down, but without sustaining any injury. In this way we scaled many terraces; and always directing our course westward, we arrived at a vast expanse, commanded on all sides by mighty peaks, the highest of which was the Jungfrau. Jacob made us halt here a second time, no doubt for the purpose of reconnoitring the ground. With regard to ourselves, we saw nothing but insurmountable difficulties on all sides: on the right, vertical precipices; on the left, masses of ice, which threatened to crush us by their fall; and in front, the Great Fissure, to all appearance impassable, so widely did it yawn. It was now near mid-day; the heat was excessive; and the guides, in order to refresh themselves, placed handfuls of snow on the nape of their necks. Many of us did the same, in spite of the remonstrances of others, who, alarmed at such imprudence, forgot that, in these elevated regions, the material organism, as well as the moral nature, is much more independent of hurtful influences than in the plain. The reflection of the light from the snow was likewise most intense, and almost insupportable. We proceeded straight in the direction of the Great Fissure, which we reached after surmounting a fourth terrace. It is a gulf of unknown depth, opening upon the declivity of the last terrace but one, and penetrating somewhat obliquely into the snow; in no place is its breadth less than 10 feet, so that there is no means of crossing it without a ladder.

Our ladder was 23 feet long; it was consequently more than sufficient to stretch across the Great Fissure. But immediately above the latter, the steepness of the terrace was fearfully great for the space of about 30 feet; and, moreover, the snow, which had hitherto been very incoherent and almost powdery, had suddenly become of extreme density—to such a degree that the guides were obliged to cut steps. Our courage was here put to the first proof. Jacob and Jaun were the first to mount. When they were half way up the terrace, they let down the rope to us; holding it by one of the ends, and the other being fixed to the ladder, it served us as a kind of stair. All of us, in this way, arrived at the summit of the terrace without mishap, but not without difficulties. There now remained only one eminence for us to surmount, in order to reach to Col du Rott-thal [a neck of the mountain about 800 feet below the peak]. The soft snow had again replaced the hard snow of the steep ascent, so that we walked with the greatest ease. But when we arrived at the centre of the last terrace, which we went along in a sloping direction, we encountered another fissure, which seemed as if it would stop our progress; it penetrated, like the Great Fissure, obliquely into the mass of the snow, so that one of its walls was thinner than the other, and ran beneath it—a circumstance which rendered the passage more difficult. As Agassiz, Jacob, Juan, and I, had gone a little in advance, while our companions were still engaged in climbing the first ascent, I proposed that we should wait for them, that we might at least get the rope. Jacob thought we could pass it well enough without this precaution. In fact, he found a place where the fissure was sufficiently narrow to allow him to stride over it; after having done so, he stretched out his hand and assisted us to do the same. While three of us were standing on the edge of the northern lip of the fissure, we witnessed a very extraordinary occurrence. We suddenly heard a dull crackling noise beneath us; at the same time the mass of snow on which we stood sunk about a foot. The guide, Juan, was at this moment on the other side; and upon hearing the noise, he saw, simultaneously, the space which supported us sink down. He was so alarmed, that he cried out to us—'*Um Gottes Willen, schnell zurück!*' (In God's name, return quickly!) Jacob, on the contrary, far from allowing himself to be disconcerted, told him instantly to hold his tongue; and making a sign to us to follow him, he continued the ascent at a quickened pace, repeating, in his Haslian dialect—'*Es ist nüt; Ganget numme vorwärts!*' (This is nothing; always go forward.) Although we had great experience in glaciers, and were in some degree familiarised with all the dangers they present, I must, however, confess, that at this moment I felt my heart beat quicker than usual. Our other companions joined us a few minutes after; they crossed the fissure and the place that sunk without difficulty, having no suspicion of the adventure that had occurred to us. It was two o'clock when we arrived at the Col de Rott-thal."

There now remained by far the most arduous part of this undertaking. The part of the mountain above this col, or resting-place, is about a thousand feet in height, and rises in a slope as steep as the roof of an old-fashioned house, being at an angle of about forty-five degrees. This slope is enveloped in a thick case of hardened ice, clear and slippery on the surface. On commencing the ascent, our travellers found it necessary to have a hollow cut by the guides for every footstep they took. Of course, any one diverging in the least from this path, would have been precipitated to the bottom. To add to the difficulty, the cold increased, and the party were wrapped for a while in dense mist. They were upwards of an hour in gaining a point near the summit, which they then saw at the distance of about twenty feet, with nothing intervening but a steep-sided ridge, gradually rising towards the opposite extremity. To reach it seems to have been precisely an adventure like that of a slater moving along the top of a house—there being only this difference, that the top of the Jungfrau is covered with ice and snow, and its sides many hundreds of feet steep-down, without resting-place of any kind.

M. Agassiz thought it would be impossible to walk along such a place; but the fearless Jacob quickly showed how it could be done, by planting his feet on one side, and his pole on the other, leaning across the edge, till he got to the very peak. With some coaxing, like that of a bird with her young, he succeeded in inducing the rest to follow. Each, after passing to the peak, returned singly to the lower point. "Agassiz," says M. Desor, "remained upon the peak nearly five minutes, and when he rejoined us, I saw that he was greatly agitated; in fact, he confessed to me that he never experienced so much emotion. When I was on the summit, I could not prevent myself, any more than Agassiz, from giving way to great emotion at a spectacle of such overpowering grandeur. I remained only a few minutes; long enough, however, to remove any fear that the panorama of the Jungfrau will ever be effaced from my memory. After examining attentively the most prominent points of this unique picture, I hastened to rejoin Agassiz, for I feared lest an impression so powerful should deprive me of my usual confidence; I had need of grasping the hand of a friend; and I venture to say, that I never felt so happy in my life as when I had seated myself by his side on the snow. I believe that both of us would have wept had we dared; but a man's tears ought to be modest, and we were not alone; and such is the strength of the habits which society makes us contract, that, at the height of 12,000 feet, there was still a regard to etiquette!

It is not the vast field which the eyes embrace that constitutes the charm of these views from elevated mountains. The experience of the preceding year on the Col of the Strahleck, had taught us that distant views are, in general, very indistinct. Here, from the summit of the Jungfrau, the outlines of the distant mountains appeared to us still less accurately defined. But even had they been as distinct as the line of the Jura, seen from an eminence in the plain, I believe that they would not long have attracted our attention, so fascinated were we by the spectacle presented by our immediate neighbourhood. Before us lay extended the Swiss plain, and at our feet the anterior chains were piled up in stages; and they seemed, by their apparent uniformity, still farther to increase the size of the mighty peaks which rose almost to our level. At the same time, the valleys of the Oberland, which, at the moment of our arrival, were shrouded in thin mists, could be descried in many places, and we were thus allowed to contemplate the lower world, in some measure, through the openings.

On the southern side, the view was intercepted by the clouds, which had been collected for some hours on the chain of Mont-Rosa. But this disappointment was more than compensated by a very extraordinary phenomenon. Thick mists had accumulated on our left, in the direction of south-west. They always rose from the bottom of the Rott-thal, and began to extend to the north upon the mountains which separate this valley from that of Lauterbrunnen. We were beginning to fear that they would envelope us a second time, when they suddenly stopped at some feet from us, no doubt from the effect of some current of air from the plain, which prevented their extending

farther in this direction. Thanks to this circumstance, we found ourselves all of a sudden in presence of a vertical wall of mist, the height of which was estimated at 12,000 feet at least, for it penetrated to the bottom of the valley of Lauterbrunnen, and rose many thousand feet above our heads. As the temperature was below the freezing point, the minute drops of the mist were transformed into crystals of ice, which reflected in the sun all the colours of the rainbow; one would have said that it was a mist of gold which sparkled around us. It was a spectacle at once terrible and attractive.

When we had all again returned to the elbow or projecting angle mentioned above, Jacob poured out a glass of wine for each of us, and we drank with great feeling to the health of Switzerland."

After some remarks on the form of the mountain, M. Desor proceeds to state, that the thermometer sunk to 26 degrees Fahrenheit, but they did not feel the cold.—"The sky over our heads was perfectly clear, and of so deep a blue that it approached to black; we endeavoured to discover the stars in it, which are said to be visible during the day at great heights, but we did not succeed. It has been pretended that this deep tint is only the effect of the contrast with the snowy surfaces which surround the observer on all sides. But if this were the case, the intensity of the hue would be equal in every part of the celestial vault. Now, this is precisely what did not take place.

To our great surprise, we discovered on the surface of the exposed rock, as well as on the fragments detached from it, many lichens in a very fresh state, some of which occupied a surface of many inches in diameter. We could not expect to find living beings at such a height; it seemed that even the Podurella of the glaciers did not ascend thus far, for we did not meet with one. To make up for this, we perceived a hawk hovering in the air above our heads. One would have said that our presence excited its curiosity, for it described many circles around us.

There is another point on which it remains for me to say a single word, and that is, the influence of the air, in elevated situations, on the human frame. Many naturalists and physiologists will doubtless expect that some new facts were observed by us; but I must confess, that during the whole time we were on the summit, and also during the ascent, we experienced none of those occurrences, such as nausea, bleeding at the nose, ringing of the ears, acceleration of the pulse, and so many other inconveniences which those who have ascended Mont Blanc tell us they were subject to. Must we ascribe this to the difference of 1500 feet, which there is between the height of Mont Blanc and that of the Jungfrau? Or rather, should we not seek the cause in the habit we had contracted while living for many weeks at the height of near 8000 feet?"

After fixing a pole with a handkerchief upon it in the snow of the peak, the party commenced their descent at four o'clock. The steep slope down to the Col de Rott-thal had to be descended backwards, foot after foot being carefully retraced in the steps formerly cut by the guides in ascending. This part of the journey occupied a full hour, and it must have been one of great peril. The remainder of the descent was performed without any remarkable difficulty or adventure, and a little before midnight, they regained their lodgings at the Mœril chalets.

LIFE AND POETRY OF ROBERT NICOLL.

Robert Nicoll died in the latter part of the year 1837, in his twenty-fourth year, after having drawn some attention to his name by the publication of a volume of poems, and the able and ardent style in which he conducted, for a short time, an English provincial newspaper. A second edition of the poems, containing many pieces not before published, and having a memoir of the author prefixed, has been, with a characteristic disinterestedness, presented to the public by Nicoll's early patron and best friend, William Tait of Edinburgh. From this volume, we learn that Mr Nicoll was emphatically a child of poverty. His father, a small farmer in the parish of Auchtergaven, in Perthshire, "had become security, to the amount of five or six hundred pounds, for a connexion by marriage, who failed and absconded; and the utter ruin of his own family was the almost immediate consequence. He gave up his entire property to satisfy the creditors of this individual; he lost even the lease of his farm, and, with his wife and several young children, left the farm-house, and became a day-labourer on the fields he had lately rented, with nothing to sustain his wife and himself save the consciousness of unblemished and unblamed integrity. Robert Nicoll was thus, from the date of his earliest recollection, the son of a very poor man, the inmate of a very lowly home, the eldest of a struggling family. Field labour was the daily lot of his father, and, at certain seasons of the year, of his mother also, as far as was compatible with the care of her young and increasing family; and the children, as soon as they were considered fit for labour, were one by one set to work. Yet that goodness and mercy which temper the severest lot of the virtuous poor, were around them; and at the lowest ebb of their fortunes, many of the best blessings of life must have mingled with and sweetened their toils and hardships. That could not have been other than a cheerful as well as a happy home and hearth, from which sprung the germs of Nicoll's poetry—his songs, his descriptions of rustic manners, and his portraits of rustic contemporaries."

Like Tasso, he could speak at nine months, and read before he was five years old; his education being almost solely the gift of a mother whose character seems to have included much of the heroine. The southern reader will be surprised to hear of a boy herding cows, and in that situation reading the classic productions of English intellect, hired by his own earnings from a parish library. From eight years of age, this studious boy had to depend entirely on his own resources for support. At about thirteen, when already he had begun to write in verse, he *bound himself* apprentice to a wine-merchant and grocer in Perth, and he seems to have all but served out the full period of seven years. A keen and fiery genius, which had not passed through the brakes of poverty without some exasperation from its thorns, came to maturity at the time when the cry for reform was making soberer men frantic, and he eagerly imbibed the most extreme of what are called radical politics. His opinions generally were such as a youth in his situation, self-educated, uncorrected by intercourse with more experienced and deep-read men, and perhaps a little spoilt by flatterers of his own order, is but too apt to form. By and by, he scribbled for newspapers and spoke in debating clubs; and he was little more than twenty when his writings made him known to literary persons in Edinburgh, who could appreciate his talents. Meanwhile, the poverty of his family continued the same, though his noble-minded mother made every exertion to stem it. With something less than twenty pounds, raised by this excellent woman, the young poet commenced business with a circulating library at Dundee—a line of life which rather favoured than obstructed his literary pursuits. The concern was necessarily a small one, and its profits extremely limited: to help him on, his mother, though living thirty miles off, saved him some otherwise unavoidable domestic expenses, and sent him from her humble home regular supplies of the oaten bread which frugal Scotland still largely uses. How striking a contrast is presented by these circumstances to the style of mind which must have existed both in Nicoll and his mother, as evinced by the following extract from a letter addressed by the one to the other in February 1836:—"That money of R.'s [the money borrowed that he might commence business] hangs like a millstone about my neck. If I had it paid, I would never borrow again from mortal man. But do not mistake me, mother; I am not one of those men who faint and falter in the great battle of life. Cowardly is that man who bows before the storm of life—who runs not the needful race manfully, and with a cheerful heart. If men would but consider how little of *real* evil there is in all the ills of which they are so much afraid—poverty included—there would be more virtue and happiness, and less world and mammon-worship on earth than is. Half the unhappiness of life springs from looking back to griefs which are past, and forward with fear to the future. That is not my way. I am determined never to bend to the storm that is coming, and never to look back on it after it has passed. Pain, poverty, and all the other wild beasts of life which so affright others, I am so bold as to think I could look in the face without shrinking, without losing respect for myself, faith in man's high destinies, and trust in God. There is a point which it costs much mental toil and struggling to gain, but which, when once gained, a man can look down from, as a traveller from a lofty mountain, on storms raging below, while he is walking in sunshine. That I have yet gained this point in life I will not say, but I feel myself daily nearer it."

The most assiduous industry, perfect purity of life and heart, and the kind wishes of many friends, could not ensure bread to the poet in his present situation. He continued in it a twelvemonth, and during that time published his poems, which received much favourable notice from the press, and made him extensively known. The fame which he thus acquired, joined to the exertions of his friend Mr Tait, obtained for him the situation of editor of the *Leeds Times*, and he removed accordingly to that town. He entered the field of his editorial duties as a young Chippeweyan flings himself amongst his enemies in his first battle. His writings displayed a boldness and energy which were only the more striking from the strong evidences which the author gave that his heart was in every word he uttered. Amidst a host of oppressive duties, he remembered an early attachment, and made its young and amiable object his bride. But studies pursued in boyhood, when tired nature called for recreation, and an incessant subjection now to the excitement and exhaustion of newspaper life, undermined the constitution of the young bard, and he sunk under consumption before he had been an editor much above a year.

Nicoll was a youth of gentlemanlike appearance, slender in figure, with pleasing features, and a pair of large dark eyes, which Mary Howitt declared to be the finest she had ever seen. Though he was, in some circumstances, jealous and reserved, kindness readily brought out at any time all the native softness and suavity of his character. His aspect and demeanour spoke strongly of that nervous temperament which gives such an impetus to the mental organisation, and is so apt to wear it out, and "fret the pigmy body to decay." The bulk of his poetry, accordingly, appears rather the emanation of ardent and enthusiastic feeling, than of any of the deeper sources of thought. He is the Körner of the young, lowly, and aspiring—the class to which he himself belonged. It is this class of his poems which are the most original and expressive: we think he fails, comparatively, in the descriptive, and more decidedly so in the attempts which he has made at the delineation of rustic character and life in his native dialect. Yet, even in the latter style, he wrought many good verses, as in the following piece, entitled *Our Auld Hearthstane*:—

"Where ance the cosie fire was bien,
The winter rain-drap owrie fa's;
My father's floor wi' grass is green,
And roofless are the crumblin' wa's.
Auld thochts, auld times, upo' my heart
Are backward rowin' ane by ane:
We'll bow our houghs, and hae a crack
About them on our auld hearthstane!

Our laigh cot-house I mind fu' weel:
On ae side mither spinning sat,
Droning auld sonnets to her wheel—
And purring by her side the cat.
Anent was sair-toil'd father's chair,
Wha tauld us stories, sad and lane,
O' puir folk's waes, until we wish'd
Them a' beside our cosh hearthstane.

And when the supper-time was o'er,
The Buik was tane, as it should be,
And Heaven had its trysted hour
Aneath that sooty auld roof-tree:
Syne ilka wean was sung to sleep
Wi' sangs o' deeds and eages gane;
And rest was there until the sun
Cam' blinkin' on our auld hearthstane."

The most characteristic style of Nicoll is seen in such poems as that entitled *Thoughts of Heaven*, which we quote entire:—

"High thoughts!
They come and go,
Like the soft breathings of a list'ning maiden,
While round me flow
The winds, from woods and fields with gladness laden:
When the corn's rustle on the ear doth come—
When the eve's beetle sounds its drowsy hum—
When the stars, dew-drops of the summer sky,
Watch over all with soft and loving eye—
While the leaves quiver
By the lone river,
And the quiet heart
From depths doth call
And garners all—
Earth grows a shadow
Forgotten whole,
And Heaven lives
In the bless'd soul!

High thoughts!
They are with me
When, deep within the bosom of the forest,
Thy morning melody
Abroad into the sky, thou, throstle, pourest.
When the young sunbeams glance among the trees—
When on the ear comes the soft song of bees—
When every branch has its own favourite bird
And songs of summer, from each thicket heard!—
Where the owl flitteth,
Where the roe sitteth,
And holiness
Seems sleeping there;
While nature's prayer
Goes up to heaven
In purity,
Till all is glory
And joy to me!

High thoughts!
They are my own
When I am resting on a mountain's bosom,
And see below me strown
The huts and homes where humble virtues blossom;
When I can trace each streamlet through the meadow—
When I can follow every fitful shadow—
When I can watch the winds among the corn,
And see the waves along the forest borne;
Where blue-bell and heather
Are blooming together,
And far doth come
The Sabbath bell,
O'er wood and fell;
I hear the beating
Of Nature's heart:
Heaven is before me—
God! Thou art!

High thoughts!
They visit us
In moments when the soul is dim and darken'd;
They come to bless,
After the vanities to which we hearken'd:
When weariness hath come upon the spirit—
(Those hours of darkness which we all inherit)—
Bursts there not through a glint of warm sunshine,
A wing'd thought, which bids us not repine?
In joy and gladness,
In mirth and sadness,
Come signs and tokens:
Life's angel brings
Upon its wings
Those bright communings
The soul doth keep—
Those thoughts of Heaven
So pure and deep!"

Lines like these, written by one who had only ceased to be a grocer's apprentice three years when he died,

are, we verily think, something of a wonder. As a specimen of his softer strain, the reader will be pleased with *The Nameless Rivulet*, an idea perhaps suggested to him by one of a few very poetical lines in Home's *Douglas*—

"Or by some nameless stream's untrodden banks."

"We met within a Highland glen—
Where, wandering to and fro
Amid the rushes and the broom,
A pilgrim thou didst go.
Tripping betwixt thy gowany banks
I heard thy tinkling feet,
While with thy solitary voice
The primrose thou didst greet!

Then, nameless stream, I imaged thee
A pure and happy child,
Whose soul is fill'd with guileless love,
Its brain with fancies wild;
Which wanders 'mid the haunts of men,
Through suffering, care, and fear,
Pouring its waking thoughts and dreams
In Nature's faithful ear!

Like brothers, streamlet, forth we fared,
Upon a July morn,
And left behind us rocky steep,
And mountain wastes forlorn.
Where'er thy murmuring footsteps stray'd,
Along with thee I went;
Thy haunts were Nature's fanes, and I
Was therewith well content.

Adown by meadows green we roved,
Where children sweet were playing,
We glided through the glens of green,
Where lambkins fair were straying.
We linger'd where thy lofty banks
Were clad with bush and tree,
And where the linnet's sweetest song
Was sung to welcome thee.

Then came the forest dark and deep;
As through its shade we went,
The leaves and boughs, with foliage bow'd,
Were with thy waters blent.
And through the leafy vale the sun
Fell lone and fitfully,
To kiss thy waves, that from the hills
Came flowing on with me.

And when we left the wild-wood's shade,
From fields of ripen'd grain
The reapers' song came sweetly down,
And thine replied again.
Away we went by hut and hall,
Away by cottage lone,
Now lingering by a patch of wood,
Now moving heedless on!

Where praying monks had been we pass'd,
And all was silent there,
Save when thy voice the echoes waked,
Which heard the hermit's prayer.
We pass'd by thickets green and old,
By craggy rocks so steep,
And o'er leaf-shadow'd waterfalls,
We cheerily did leap.

And then a spot upon us burst,
Where hills on either side
Rose up, all clad in coppice-wood,
Which rock and steep did hide.
The ivy clasp'd each stone and bush
Thou flow'dst along between;
While rock and river, bird and flower,
Fill'd up the glorious scene.

By happy homes of toiling men,
We this sweet day have pass'd,
And have enjoy'd each sight and sound,
As though it were our last:
And now we loiter lazily
Beneath the setting sun;
My journey ends when starlight comes—
Thine is not well begun!

Now, Highland streamlet, ere we part,
Which didst thou love the best
Of all we've seen since, silently,
We left thy Highland nest?
Lovest thou best the meadow green,
Or Highland valley grey?
Or lovest thou best, by hazel braes,
At eventide to stray?

Or dost thou love where forest trees
Thy little waves are laving?
Or wealthy fields, where golden grain,
Ripe, to the sun, is waving?
The rustle of thy fleety foot
Upon my ear doth fall—
Thou stream, like this full heart of mine,
Dost dearly love them all!

Without a name, and all unknown,
Fair streamlet though thou art,
Be still unchristen'd! but I'll keep
Thy murmurs in my heart.
My story of thy pilgrimage
Will to the careless tell
How much of love and beauty in
Unnoted things do dwell."

One anecdote before parting with this interesting volume. When the young poet became seriously ill at Leeds, his mother paid him a visit. On this point, the biographer has the following note, which must send a thrill through every bosom:—"There is much false and injurious delicacy among all the ranks of British society, in speaking of pecuniary matters; yet it would be almost a sin against the finer humanities, if this absurd feeling were to lead to the suppression of an anecdote of Nicoll's mother, which, besides being characteristic of the woman, illustrates the noble character of the peasant-matrons of Scotland. The Nicolls, it need not be told, were a very poor family; the mother nobly struggling to educate her children, and, by this means, to raise their condition to the level from whence misfortune alone had driven them. Mrs Nicoll had by this time acquired some little property, solely by her own exertions and industry; but she had no money to spare to defray the necessary expenses of a journey to Leeds, where her son lay, as she must have feared, dying, and languishing to see her. When a friend afterwards inquired how she had been able to incur this expense, as poor Robert was in no condition to assist her even to this extent, her blunt and noble reply was—'Indeed, Mr ——, I shore for the siller.' Her wages, as a reaper, her 'harvest fee,' was the only means by which she could honestly and independently fulfil her beloved son's dying wish, and accomplish the yearning desire of her own heart. It would indeed be a sin against whatever gives Scotland her proudest distinction among the nations, to suppress this anecdote of Robert Nicoll and his mother. It reveals things to which wealth and grandeur may in reverence bow their heads!"

THE BOX-SEAT MAN.

Most people who have been in the habit of travelling a good deal by stage-coaches, will have observed, it is presumed, that, go as soon as they might to the starting-place, they have invariably found that the best outside seat, namely, the box-seat, or seat beside the driver, has been already secured by some fortunate individual; the fact of its being so secured being intimated, not by the personal presence of the said fortunate individual, but by that of his representative, in the shape of a many-caped drab greatcoat, which is formally displayed on the much-envied seat, for the express purpose of proclaiming prepossession, and thus preventing all attempts at appropriation.

If you are yet but green on the road, that is, if you have not yet been much in the way of stage-coach travelling, this constant pre-occupation of the box-seat by some particularly lucky person will, in all probability, puzzle you a good deal for a time. You will be unable to conceive who or what the mysterious owner of the many-caped drab greatcoat can be, and will be much at a loss to understand how he contrives to have his greatcoat *always* so timeously deposited on the much-desired seat, since, as already remarked, come as early as you please, the many-caped coat is sure to be before you.

An interest, too, of the kind excited by mystery, attaches to the owner of the coat, and you each time look out for his appearance with a good deal of anxious curiosity. You do not yet know that the owner of the drab greatcoat is an especial favourite of the driver, and of the guard too for that matter, and, indeed, a general favourite on the road. Not being aware of this, you do not know that the extraordinary apparent good fortune which secures him the box-seat is the result of a conspiracy amongst waiter, boots, chambermaid, guard, and coachman, who each and all take an interest in having the greatcoat dispatched betimes to the coach, placed on the seat so often mentioned, and kept and defended there against all comers deadly, until replaced by the man himself. Only think, gentle reader, what chance you can have of obtaining that seat! Why, you might as well hope to get upon the woolsack.

With perhaps occasionally some little difference of feature, the box-seat man is the same every where, and has been so from time immemorial. He is a stout, jolly personage, with a rubicund countenance, an open, off-hand, free-and-easy manner, and a rich jovial voice. He is somewhere between forty and fifty years of age; has been "on the road," as a commercial traveller of course, for nearly thirty years; and well does he know the road—meaning thereby every road in England and Scotland, and perhaps not a few also of those of the step-sister kingdom. Every turn of them does he know—every toll-bar—every inn. As regards the last, his knowledge is singularly comprehensive, including a perfect familiarity with the names of all the officials connected with them, and a thorough acquaintance with the gastronomic excellences and defects of each.

In reference to this last subject, long and extensive experience has informed him that entire success in a variety of dishes is not to be met with in any one particular inn on the road. But the same experience has informed him of a number of houses, each excelling in particular and different dishes. Thus, if you were to question him on these matters, he would probably give you something like the following information, astonishing you with the extent of his knowledge, and exciting your wonder at the vigilance and careful observation which could have noted the superior cookery, as regards particular dishes, of establishments so far distant from each other.

"Why, my dear sir, as for a steak—a regular good steak—you must go to the Green Dragon, Brampton. The finest steak I ever ate in my life was there. Beautiful border of fat—done to a turn—juicy—hot; capital pickles! Gemini! what a morsel!" and he rubs his hands in an ecstacy of delight with the savoury reminiscence. "Now, again, for a mutton chop, I would decidedly give the preference to the Black Bear at Bath. Splendid chops there, my dear sir—splendid, regular South Downers! Bacon and beans! Excellent dish—capital! The Tiger and Trumpeter, York, for that. You get it there in first-rate style. Hodge-podge!—Ah! you must come to Scotland for that. I never get the right thing any where else. Saw it once tried at Chichester—downright failure—murdered. Magnificent dish hodge-podge, my dear sir, when well got up." Thus would our friend, if questioned, discuss the interesting subject of good living, to which he has always been a steady adherent.

But by what art has he managed to make himself so general a favourite on the road?—how contrived to gain the good graces of so many classes of officials? Why, there are two or three things that contribute to this happy result. There is the great length of time he has been upon the road, his good humour, his frank and pleasant manner, &c. &c.; but the principal source of his popularity is his liberality. He is a generous fellow; pays like a prince, especially waiters, boots, drivers, &c. Waiters, therefore, fly to serve him; chambermaids give his bed an extra tossing to soften it; and boots would go through fire and water, or swim through a sea of shoe-blacking, to do him a good turn.

It is this last person generally, in conjunction with the strapper, and with the connivance of the coach-driver, who deposits our friend's greatcoat on the box-seat, being equivalent to a display of the national flag by a party landing upon some island as yet only possessed by savages.

We do not know it to be a fact, but we rather suspect that, in the case of a coach starting very early of a morning, our friend's coat is deposited on the box-seat on the previous night by boots or coachee, to prevent all possibility of any other person claiming it.

While all the officials of the road like our box-seat man, he in turn likes all of them, but he affects none so much as his chum, the coachman. They have known each other long, and have journeyed together throughout many a cold and stormy night. No wonder our friend should be a favourite with coachee, when we consider the many little courtesies and endearments that pass between them. At every stage, they take nips of brandy together, our friend, of course, paying the cost thereof. At every stage, too, sometimes oftener, he supplies coachee with a fresh cigar, a box of which he carries fully as much for this generous purpose as for his own gratification. And then for his knowledge of horse-flesh. His correct judgment of, and knowing remarks on, off-side leaders and near-side wheelers, how they do endear him to coachee's heart! Again, our friend is a man to whom the latter can with perfect confidence and safety, at any time, in the case of any sudden call or emergency, intrust the reins—a thing which he could not venture upon with one traveller in a thousand.

The box-seat man never goes inside a coach. He abhors the very idea of it. He, in fact, will not take any other than the box-seat. He would rather wait for the next coach than do so, should he by any extraordinary accident have been cut out of his favourite seat. To him travelling inside of a coach is one of the dullest things imaginable. No cigar smoking; no fun with passing travellers; no joking with toll-bar keepers and gaping villagers; and, worse than all, no pleasant confabulation with coachee, the man after his own heart on a journey.

The box-seat man, courteous reader, is the gentleman whose jolly voice is first and most distinctly heard in the passage of the inn, after the arrival of the coach. It is he, too, who surprises you by appearing to be so much at home at every inn he comes to, entering each and all of them with the free-and-easy air of an old acquaintance, which the cordial welcome he meets with shows that he is indeed considered. On such occasions, our friend makes straight for the bar. There he is received by both host and hostess with a most friendly greeting, after which follow the potations in which such personages as we are describing are somewhat too apt to indulge.

You never saw the box-seat man, say you, gentle reader? No. Well, then, you may see him now.

Look at the coach approaching there. See you that immense mass of greatcoat, cloak, and comforter planted beside the driver, the which mass is surmounted by a broad, red human countenance? You see it? Yes. Well, then, gentle reader, that is the box-seat man; and seeing one is quite the same as seeing a thousand.

THE RIOTS OF 1780.

Our fathers, till the breaking out of the French Revolution, knew no more serious instances of popular violence than the riots which took place in London in 1780. The cause which led to these outrages was the passing of a bill to do away with some of the severer penal statutes against the Catholics of England. This act of the legislature roused the indignation of a large portion of the people, and produced much excitement, under the influence of which some riots took place in Edinburgh and Glasgow in 1779. A vastly ramified body, taking upon itself the name of the Protestant Association, undertook to petition for the repeal of the act; and at their head they placed Lord George Gordon, a young member of the House of Commons, who had distinguished himself by the part he took in the movement.

Lord George was a younger son of the deceased Duke of Gordon (a family recently Catholic), and was now in his twenty-eighth year. He had served in the army, but retired from it in disgust; his mind seems to have been ever liable to enthusiasm and eccentricity. In Parliament he dissented from Tories and Whigs alike, so that a saying arose, that "there were three parties in the house—the Ministry, the Opposition, and Lord George Gordon." In especial was this young nobleman zealous in denouncing all propositions for relieving the Roman Catholics from their burdens and disabilities. On this account he acquired a degree of notoriety throughout the country, as almost any public man may do who adopts a hobby and adheres to it obstinately. In Parliament he was generally thought a well-meaning man, with a slight craze upon the subject of religion. In manners he was modest and reserved, though warm at times in his oratory. It is stated that, on one occasion, he went and asked an audience of the king. His request being granted, he entered the royal closet, and deliberately bolted the door behind him. He then gravely addressed his majesty, and, warning him of what had pushed the Stuarts from the throne, asked him to order his ministers to support the Protestant petitions. The king said, that not he but Parliament had passed the relief-bill; and Lord George could get no more out of him.

Things gradually assumed an alarming form. Deputation after deputation came from the country, and large aggregate meetings took place in London. An anti-Catholic petition was drawn up, which received what was then the unusual number of 120,000 signatures. Great influence was used by the friends of Lord George to wean him from his connexion with a body to which his name added some respectability; but their exertions were in vain. At length the crisis arrived. An assembly was held in Coachmakers' Hall, for the purpose of considering the best way of presenting the great petition to the House of Commons. The chairman, Lord George Gordon, spoke warmly, and recommended that the association should meet in St George's Fields, at ten o'clock on the ensuing Friday, the 2d of June, when they might accompany him to the House, and give him the weight of their countenance while he presented their petition. He warned them to appear in numbers, as he would not present the petition unless 20,000 men were assembled. For the sake of distinction, he told them to come with blue cockades. All this was agreed to.

The poor young man, vain, doubtless, of his position, little thought what an engine of mischief he was setting in action, and how vain his own power to check its operations. At ten o'clock, on the 2d of June, a vast multitude assembled at the appointed spot; it was said to have numbered from 40,000 to 60,000 persons. At eleven, the hero of the day appeared, and arranged the procession. It came clearly out on trial that he did not wish the whole to advance to the House, but he wished a parade; and one party was ordered to cross London Bridge, another across Blackfriars, and a third was to follow himself across Westminster Bridge. Away, accordingly, they went, with banners flying, and music playing. They reached the House with all due decorum; but when Lord George had entered, they fell into great disorder. Blocking up the avenues to both Houses, they engaged in bawling their favourite rallying cry of "No Popery," and soon began to notice the obnoxious members, peers, and commoners, as they passed. The Archbishop of York was grossly abused; Lord Bathurst was hustled and kicked; Lord Mansfield had his carriage smashed; the Duke of Northumberland had his pocket picked; the Bishop of Litchfield had his gown torn; the Bishop of Lincoln had the wheels pulled from his carriage, and he only preserved his life by entering a house, and escaping by the leads; and Lords Townshend, Hillsborough, Stormont, and others, were roughly used, the quieus being torn from some of their heads.

Meanwhile Lord George Gordon, who saw not all that was going on without, left the body of the House every short while, and, from the top of the gallery stairs, harangued the people, who had made their way into the lobby. His lordship told them that certain members, and particularly Mr Burke, were opposing the cause. "Gentlemen," he said, "Lord North calls you a mob." This was the way, certainly, to make matters worse, and worse they accordingly became. The House was in a state of siege. The entering members were maltreated, and attempts were made to force a way into the body of the senate, the sitting members of which remained in great alarm. Lord George, who, according to the evidence, seemed inflated with childish joy at this display of his influence on the masses, was warned, remonstrated with, and even seriously threatened, by his friends. General Grant, a near relative, said to him, "For God's sake, Lord George, do not lead these poor people into danger;" and Colonel Gordon, another relative, loudly accosted him, in the hearing of the people, with the words, "My Lord George, do you intend to bring your rascally adherents into the House of Commons? If you do, when the first man of them enters, I will plunge my sword, not into his, but into your body!" Lord George only smiled, as if in superior wisdom, and continued his addresses, remarking on the vain efforts made to dissuade him from his duty.

A party of the horse-guards had been sent for, and arrived under Justice Addington. With great good sense, that gentleman prevented the apparently impending conflict, by assuring the people that he would send away the military, if they would promise to disperse quietly. By this means, he got many of the better-disposed to go home. The great petition being only supported by six members, Lord George was persuaded to enter a chariot and go away, as a means of dispersing the rest. The remaining rabble drew him to the city in triumph. Somewhat alarmed by this time at sight of the many-headed creature he had stirred up to fury, he begged earnestly that all would go home. But mischief was yet to come of this assemblage.

Order had been restored around the Houses of Parliament, but not elsewhere. The mob separated into divisions, and proceeded to vent their excitement on the Roman Catholic places of worship. The fine chapel in Duke Street, Lincoln's-Inn-Fields, and also that in Warwick Street, Golden Square, were attacked and stripped of their ornaments; the altars, pulpits, pews, and benches, were made fires of, and nothing was left but the bare walls. The military were called, but did not arrive in time to prevent the evil, though several rioters were captured. Here it may be remarked, once for all, that great blame was subsequently attached both to the civil and military powers for their inefficiency during the whole riots. They did attack, and shoot, and slay, but not with such concentration of their force as might be expected to make a decided impression. The Lord Mayor was much blamed for want of energy, and, indeed, the civil power was generally much at fault.

On Saturday the destruction was slight; but on Sunday, some of the remaining chapels, and the houses of the Catholics in and about Moorfields, were gutted, and bonfires made of the furniture. On Monday, a party destroyed the Catholic chapels in Virginia Lane, Wapping; and a second party went to Nightingale Lane, East Smithfield, where they destroyed chapels, and committed other outrages. The houses of Sir George Saville, the mover of the relief-bill, and of two merchants, were also reduced to bare walls.

But on Tuesday, though proclamations and rewards were issued, though the city was laid under martial law, and though the soldiery repeatedly used their arms in the streets, the audacity of the rioters rose to a still greater height. Among the private houses utterly destroyed on this day, were those of Justice Hyde, Justice Cox, and Sir John Fielding. Of many such atrocities which succeeded, it is unnecessary to speak, the destruction of private property being immense. Proceeding from less to more, the mob now attacked and gained an entrance to Clerkenwell prison, and speedily set the prisoners at liberty. Newgate underwent a worse fate. The mob commanded the keeper to deliver up the confined rioters. He firmly refused, on which they began to break the windows, to batter the gates with pickaxes and sledge-hammers, and to attempt to climb the walls. The effective mischief, however, was done by combustibles, which they threw into the keeper's house, till it was in flames. These were soon communicated to the chapel, and subsequently to the prison. During the spreading of the conflagration, the rioters had made their way among the cells, and, by means of their sledge-hammers, released all the prisoners, amounting in number to three hundred, among whom were four condemned to death. These auxiliaries from Clerkenwell and Newgate were not likely to compose the excited city. Many lives were lost at the burning of Newgate.

The climax of the confusion was still to come. Encouraged by the disgraceful supineness of the civil authorities, they became so insolent as to send notice to the prisons of King's Bench, the Fleet, New Bridewell, at what hours they would come and burn these buildings down; and they faithfully acted as they promised. The same kind of fiendish outrage was exercised towards Mr Langdale, distiller, Holborn, whose store-houses and stock, amounting in value to nearly L.100,000, were consumed and otherwise destroyed. At the close of Wednesday, London presented a spectacle scarcely to be paralleled even in the annals of war. Six-and-thirty fires were blazing at one time in different quarters of the city. At the prisons, and in Holborn, the conflagrations were dreadful beyond description. And while the trembling citizens glanced from their loop-holes at the sheets of fire and clouds of smoke floating over the capital, they also heard the fierce roaring of the authors of the mischief, alternating with the ominous report of musketry, discharged in platoons. A few hours before, the king had held a privy council, at which the feebleness of the magistracy, and the probable destruction of the city, were taken into serious consideration. The Attorney-General, Wedderburn, afterwards Chancellor under the title of Lord Loughborough, of course attended. The king asked Mr Wedderburn for his official opinion, when the learned gentleman stated, in the most precise terms, that such an assembly of depredators might be dispersed without waiting for forms, or reading the riot act. "Is that your declaration of the law as Attorney-General?" asked the king. Wedderburn answering directly in the affirmative, the king said—"Then let it be so done." The Attorney-General immediately drew up the order, which was afterwards generally acknowledged to have come just in time to save the city. Armed with this authority, the officers now proceeded to act vigorously for the suppression of the riot. Powder and ball, however, were less destructive to the rioters than their own indulged appetites. At the distilleries, in particular, of Mr Langdale, from whose vessels non-rectified spirits ran for hours along the gutters, the mob lifted the liquid in pailfuls, and great numbers drank till they killed themselves on the spot, were trampled to death, or perished in the flames.

During Wednesday, two attempts were made on the bank, but a very strong guard baffled their efforts. Through the night that followed this awful day, men, women, and children, ran up and down the streets intoxicated, or laden with plunder. The Thursday saw something like a cessation of the work of mischief, the regular army and militia having poured into the city in such numbers, as to give ample means of defence. Confusion still reigned, however, and the shops were every where shut. On Friday, the metropolis became calm, and on that day the Gordon Riots may be said to have come to a close.

The number of persons who perished in these riots could not be accurately ascertained. According to the military returns, 210 persons died by shot or sword in the streets, and 75 in hospitals; 173 were wounded and captured. How many died of injuries unseen, cannot be computed. Many more perished in the flames, or died from excesses of one kind or other. Justice came in at the close to demand her due. At the Old Bailey, 85 persons were tried for the riots, and of these 18 were finally executed, one woman, a negro, being of the number. By a special commission for Surrey county, 45 prisoners were tried, and 26 of them capitally convicted, though two or three received respites.

What did Lord George Gordon all this while? "Filled with consternation at the riots," as his counsel on trial said, he, on the 7th of June, the terrible Wednesday, sought an audience of the king, professing that it would be of service in checking the riots. No doubt the poor young nobleman would have asked the king to proclaim the intention of repealing the relief-bill, as if such a step would have had the slightest effect. But the king told him first to go and prove his loyalty by checking the riots, if he could. Lord George did really go into the city; but the President of the Protestant Association was now powerless, and does not seem even to have spoken to the mobs. One act he did which has been hastily brought up against him by a late novelist. A young man came to the door of his coach, and besought his lordship to sign a paper, drawn up for the purpose, which ran thus:—"All true friends to the Protestants, I hope, will be particular, and do no injury to the property of any true Protestant, as I am well assured the proprietor of this house is a staunch and worthy friend to the cause." It has been insinuated that Lord George Gordon wrote for friends many protection-papers like this, the language of which certainly implies a knowledge and approval of the intent to attack those who were considered enemies. But the young man proved that it was written by himself, and that Lord George signed it hurriedly in compassion. When shown to the mob, it saved the man's house.

Lord George was arrested on the 9th of June, and conveyed to the Tower under a strong guard. The government thought it prudent to allow eight months to elapse before trying him; and he was then absolved, justly to all appearance, of any foreknowledge or approval of the rioting. The after-life of this nobleman was marked by vagaries which confirmed the probability of his being afflicted with a degree of insanity. In 1786, he openly embraced Judaism, and soon after was convicted of a libel on the queen of France. He fled, to escape the sentence, but was retaken in a few months, and confined in Newgate, where he lived until fever cut short his career, on the 1st November, 1793, at the age of forty-two. He was much beloved by the prisoners, and with good reason, being generous and humane. Two Jewish maid-servants, partly

through enthusiasm, waited on him daily up to his death. The last words of Lord George Gordon were characteristic. The French Revolution had attracted him as a glorious event, and he died crazily chanting its watchword, "*Ca ira!*"

THE FRESWICK PILOT.

[Our attention has been drawn to a small volume—"Sketches from John O'Groats, in Prose and Verse," purporting to be the composition of James T. Calder, schoolmaster of Canisbay. Coming from such a remote locality as the extreme northern point of the island of Great Britain, where there exist no means for literary improvement, and being, as we are told, the first work of the kind ever printed or published in Caithness, we are inclined to look upon its unpretending pages with an indulgent eye, and hope yet for better things from its unfortunately situated author. Consisting for the greater part of legendary stories of no general interest, we select the following as almost the only piece not associated with the superstitions of a past age:—]

It is probable that few of my readers ever before heard of the name of Finlay Mowat, the Freswick pilot. Finlay flourished about the middle of the sixteenth century, and was rather a celebrated person in his way. From his boyhood, our hero showed a great predilection for the sea; and when he grew up to man's estate, his chief employment was acting as a pilot to vessels passing through the Pentland Firth, which at this period was the terror of all strangers. Though gifted with a large cranium and rapid utterance, and possessing undoubted skill as a pilot, Finlay was looked upon by his friends and acquaintances as of inferior mental capacity. But there were some clever points about him notwithstanding. Like the generality of those who are said to "want a cast," he had a great memory, and was extremely ready-witted. He was, at the same time, very venturesome, and very confident of his own nautical abilities. Every puff of wind or ripple of land-sea did not deter him from following his calling on his favourite element.

One afternoon, as our pilot was taking his dinner, one of his children came running in with the welcome intelligence that a large vessel was "flagging." Finlay instantly threw down his spoon, wiped his mouth with the back of his hand, and flew to the door. Then, shutting the one eye, and looking through his fist as a telescope with the other, he espied one of the largest ships he had seen for some time making the customary signal for a pilot. Having collected his crew, Finlay, without losing a moment's time, launched his skiff, hoisted his small lugg-sail, and set off. On nearing the vessel, a rope was thrown to the boat, and in a twinkling our pilot was on deck, in his seal-skin cap, black grey unmentionables, and pea-jacket of the same material, fastened round the waist with a large leathern strap and brass buckle. Finlay looked about him for a moment or two with a sort of bewildered curiosity. He had been on board of many vessels in his time, but there was something about this one, which was called by the formidable name of the Leviathan, that he had not observed in any other. There seemed to be a great many arms and lethal weapons of every description lying about the deck; and the crew were a set of the roughest and most desperate-looking fellows he ever saw in his life. Among other things, a black flag, with the horrible device of a death's head, particularly struck him. Was he on board a pirate ship? The unpleasant suspicion flashed across his mind; but he thought it best to "keep a calm sough," and make no remarks on the matter. "Are yon a regular pilot?" demanded Captain Gruffwater, the master of the vessel, a fierce-looking fellow, about forty, with huge red whiskers, and a deep scar across the left eye-brow. "What's your wull, sir?" asked Finlay, touching his cap with the most respectful deference. "I say, are you a regular pilot?" "Oh, ay, sir," responded Finlay, "quite *regular*. I manteen as good a character as any in wur toon, and can show ye a certificate to that effect, signed by the minister, session clerk, and four elders." "Confound your certificate," cried the captain, provoked at his stupidity; "I say, are you in the habit of regularly piloting, and well acquainted with the coast hereabouts, particularly the Orkneys?" "Oh, I understan' ye noo, sir," replied Finlay; "yes, I know every hole and bore about them perfectly. I have piloted ships in ma time to every pairt o' the Orkneys. I know the whole from Cantick Head, owre by there, in Waas, to the Start of Sanda. If I only could write, I would engage to pilot a ship to any pairt o' the known world. Whar d'ye want me to carry ye till, if it's a fair question?" "To Kirkwall," answered Captain Gruffwater. "Vera well," said Finlay, and ordering his own boat home, he immediately took charge of the vessel, and began to issue out his orders in a strong authoritative tone, and to swear lustily at the crew, partly to be revenged on the captain for bullying him, and partly to impress the ship's company with a favourable idea of his courage and independence. "Don't hurry the men in that way, sir," said the captain; "give them a little time." "Not a moment," said Finlay; "don't you see the ebb-tide is half spent, and the night will be on us ere ye can look about ye. The Pentland Firth is no a thing to be trifled wi'."

By this time the night was setting in. The sun had gone down in an ugly "bank," and the wind, which was hitherto from the south, suddenly chopped about to the north-west, and began to blow freshly. There being every appearance of what seamen term a "dirty night," the higher sails were now stowed, the top-sails double-reefed, and the ship otherwise trimmed to meet the approaching gale. Finlay continued to issue out his orders, and swear with increased vehemence. "Bear a han', tak a pull upon your lee braces there; haul home your fore and main sheets."

Meantime, Captain Gruffwater paced the deck hurriedly, now looking at the sky, and now at the rigging of the ship. He did not like the appearance of the weather, and he had no great confidence in the skill of his pilot, who appeared to him to be an ignorant and confident blockhead. At length he seized a pistol, and coming close up to Finlay, as he was standing beside the helmsman, and swearing away at a great rate, "Sirrah," said he, "I have great doubts as to your fitness for taking charge of this vessel; but if you cast her away, or expose us to the least danger, the first thing I shall do will be to blow your brains out." Finlay scratched the back of his head, and said that he would do all that a man could to bring them to the proposed harbour; but as the night was likely to be very rough, and there would be no moonlight, he thought they would better lie to at the back of Duncansbay-Head till next morning, and then they would see their way clearly. To this very reasonable and salutary proposal Gruffwater objected. He said he would not lie out all night; and ordered the pilot, if he could not bring him to Kirkwall, to bring him to some other port. While this point was discussing between Mowat and the chief buccaneer, an individual, having the appearance and attire of a person of quality of the period, hastily ascended the companion-ladder, and came on deck. The stranger's countenance, though not handsome, was strongly marked and intelligent, with a peculiar air of audacity and recklessness about it, like one habituated to desperate enterprises. This person, whom the captain addressed by the name of Northland, also expressed a great wish to get into port, and insisted that the pilot should give it a trial. "Vera well," said Finlay, "let us bear away then to Widewall; but I tell ye, before han', ye may look out for a wet jacket." After passing Duncansbay-Head, the wind and sea increased in violence, and as Finlay prognosticated, they got a tremendous washing, particularly off the island of Swana. The night, which proved exceedingly dark and rainy, added not a little to the danger and difficulty of the passage. By great good luck, however, Finlay at length got the Leviathan safe into the commodious bay of Widewall; and now he thought he had nothing to do but get his pilot fee, and make the best of his way home across the Firth. But he found that he was not so easily to get rid of his new acquaintances. The captain told him that he had still further occasion for his services, and forbade him, on the peril of his life, to leave the ship. It was in vain that poor Finlay appealed to his humanity and conscience (things of which Gruffwater knew nothing), and represented that he had a wife and six helpless children depending upon him, and that he could not be any length of time from home. Gruffwater would, on no consideration, allow him to leave the vessel. Finlay found himself in a most disagreeable plight. To add to his other miseries, he was half starved, having got nothing since he came on board except some mouldy bread and a piece of salt junk, which burnt him up with thirst, to quench which he was allowed nothing but some bad water, and not even a sufficiency of that. Whether this was owing to the niggardliness of the captain, or to the lack of eatables and drinkables on board, he did not know. Finlay's appetite, in general, was excellent, and it was a hard thing, he thought, to be treated as a slave and starved at the same time. He wished he had never set his foot on board this cursed vessel, which, in his opinion, was rightly named the Leviathan.

The next morning the captain told Finlay that, as he was short of provisions, he would have to accompany, as land pilot, a foraging party of his crew ashore. Finlay at first vehemently protested against going on any such unlawful expedition. He could not, he said, conscientiously engage in an act of downright robbery. He was a poor but honest man, and had nothing but his character to depend on, and so forth. Finlay's arguments weighed nothing with the pirate, who gave him the alternative of either going with his men, or being tucked up to the yard-arm and hanged for his obstinacy. In this fearful dilemma Finlay thought it best to make a virtue of necessity, and accompany the marauders. A party of twenty-five stout fellows, armed with swords and pistols, and headed by Northland, now took boat and went ashore, the pilot being placed in the van, and threatened with death the moment he made the least attempt to escape. The fiery cross, we believe, neither at this nor at any former period was ever used in Ultima Thule. The rumour of the invasion, however, spread like wild-fire, and a large body of the inhabitants soon collected to beat off the enemy, armed, for the most part, with graips and pitchforks. At the head of this formidable band appeared the Laird of Hoxy, mounted on a long-tailed grey garron, with a hair halter and pad of sheep's skin, and equipped with an old broadsword, which, like Hudibras's

> "Trenchant blade Toledo, trusty,
> For want of fighting was grown rusty."

To "screw their courage to the sticking point," Hoxy addressed them in a spirited harangue, to which his followers responded with a loud cheer, and brandishing their weapons, set off at a quick march to meet the free-booters. On observing the islanders, the pirates, who were dispersed in small parties, immediately formed themselves into a body, and fired a volley at them as soon as they approached within gunshot. [This act dispersed the party.] The pirates complimented them with a cheer and a second volley on their departure, and having now nothing to disturb them, set about collecting their booty. As soon as they had got on board with their plunder, the Leviathan weighed anchor, and set sail for Kirkwall, passing through Ham Sound. Previous to sailing, Finlay once more begged Captain Gruffwater to allow him to go home, adding, that if his request was granted, he would ask no pilot fee. Gruffwater, with a sardonic smile, said that he was a most useful fellow, and a first-rate pilot, and that he could not dispense with his services as long as he remained in the Orkneys. Finlay did not know what to think. He found himself actually a prisoner on board the pirate ship; and what added to his distress, he saw no means of escape. From some words which he overheard between the captain and Northland, the pirates evidently intended plundering the town of Kirkwall. It struck Finlay that in all probability he would be forced to accompany them on this occasion also, and he trembled at the idea of an encounter with the populace and the civic authorities of Kirkwall.

The pirates arrived in Kirkwall Bay in the evening; and no sooner was the ship anchored, than they set about preparing for the intended attack. The long-boat and jolly-boat were both lowered, and forty stout fellows, the very pick of the crew, together with Finlay, embarked under the charge of the same individual who led them on in the late foray in South Ronaldshay. The citizens, who had no expectation of the coming attack, had mostly all retired to bed; but the landing of the buccaneers being fortunately discovered ere it was too late, the alarm bell was instantly rung from the lofty steeple of St Magnus, and the Kirkwallers, in a very short time, mustered to a man in Broad Street, armed with every possible sort of weapon, and headed by Gilbert Balfour, the governor of the castle, and Provost Mainland—the latter gentleman, in the hurry of the moment, having taken time only to throw on his official hat and his drawers! A desperate conflict now took place between the parties. The Kirkwallers fought with the most determined gallantry, and pressed so hard upon the pirates, that they eventually found it necessary to retreat, leaving behind three of their number mortally wounded. During the flight, six of them were captured; the rest with some difficulty got to their boats, and effected their escape on board the Leviathan. The prisoners, of whom the unfortunate Finlay happened to be one, were immediately lodged in the castle of Kirkwall to await their doom.

To describe the poor pilot's state of mind at this moment would be impossible. Balfour and the civic authorities were bent on summary punishment, and Finlay saw nothing before him but the prospect of being hanged. Among other grave considerations, the thought of what would become of "Maggie and his sma' family," after he was gone, brought the tear into his eye, "albeit unused to the melting mood." He began seriously to think of preparing for another world, having, as he well knew, a great many sins to account for, both of omission and commission. In short, he became a great penitent; but still he felt a reluctance to leave the world, particularly in the circumstances in which he was placed. To die decently and honourably in his bed like a Christian was nothing; but to be hanged by the neck in Orkney, and that, too, for a crime of which he was not guilty, was a most distressing and unfortunate business. But how was he to clear himself? He had no friends or acquaintances in Kirkwall, and before he could get any over from Caithness, he would be defunct—dead as a herring. At length he bethought himself of his certificate from the kirk session, which invaluable document he generally carried along with him. This testimonial satisfactorily proved two things—namely, that the bearer thereof was a native of Canisbay, and, at the time when it was written, which was two years back, he maintained a decent moral character; but as Mr Inkster, the town-clerk, shrewdly observed, he might be a pirate and a vagabond *now*. Fortunately, at this critical period, Mowat, the Laird of Bucholie, to whom Finlay was particularly well known, happened to arrive in Kirkwall, and through his means, aided by the certificate in question, the pilot was acquitted of the charge of piracy, and liberated from prison.

The next day, two ships of war, commanded by Grange and Tullibardine, arrived in Kirkwall Bay in pursuit of the pirate ship, which contained the celebrated Earl of Bothwell. It was he who had headed the two plundering expeditions just described. Grange and Tullibardine were much disappointed in not falling in with the fugitive, Bothwell having, some hours previous to their arrival, sailed for the North Isles.

EMIGRATION TO CANADA.

The *Scotsman* gives an abstract of a late report on this subject, from which we gather that the circumstances which for some years checked the stream of population in its course across the Atlantic have now ceased, and that the last year's emigration to Canada alone was 28,086, of whom there were of adult males 10,952, of adult females 8,468. It appears from this report, that the voyage by the emigrant vessels to Canada is unfavourable to infant life, the number who died on the passage, out of 5065 children under 7 years of age, being 161.

During the last twelve years, 321,807 persons have emigrated to ports in the United States, and 347,632 to ports in Canada, being in the one instance an average of 26,800 per annum, and in the other 28,700. It thus appears, speaking roughly, that the population of this country increases about as much every two months as emigration reduces it in a year. The average length of voyages to Quebec is 47 days, the shortest voyages being those which commence in April and May. The following passages from the report are interesting, and may be of use to our readers:—

"The number of emigrants who have received parochial aid or assistance from their landlords to emigrate this season, considerably exceeds that of 1840, and amounts to 2124, of whom from England there were 807; Ireland, 546; and from Scotland, 771. Those from England, with the exception of 110 Irish emigrants from Liverpool, aided by the Earl of Fitzwilliam, from his estate in Wicklow, were sent out chiefly under the sanction of the Poor-Law Commissioners, and were (as well as those who have emigrated during these several years past under the same authority) well and amply provided for.

The Scotch emigrants were, I regret to say, not so well provided; and many of them were quite unsuited, by their previous mode of life, to succeed in a country where agricultural employment is their chief dependence. They are principally from Glasgow and Paisley, and landed here, many in great distress, and all very poor. From the former port there were 663, chiefly weavers, and a few mechanics; the latter have generally done well. They are members of the different emigration societies, and have been enabled to emigrate by public subscriptions and weekly contributions made by each family, by which means they were barely able to procure a passage and the necessary provisions for the voyage. They con-

sequently landed here in a destitute state, and depending on immediate employment for the support of their numerous families. They all appear to have left their homes under the impression that they would be supported and forwarded to any section of the province they wished to settle in at government expense, and that, if they could only reach this port, all their wants would be provided for. I had the greatest difficulty in making them understand that all the government would undertake to do for them would be to put them in the way of obtaining employment (which I offered to them in this neighbourhood), and that they must depend on their own industry for support. Should employment not be procured here, I stated that they would be assisted to proceed to other places where it would be obtained. Some few families, numbering nearly sixty persons, remained here, and worked for two or three months on the roads, at 2s. 9d. and 3s. a-day. They are now settled on land in the flourishing townships of Leeds and Ireland, about fifty or sixty miles from this city, and are in a fair way, from their own industry, of being in a few years independent. I have the gratification at present to know that their families are above want. Their success has been promoted by some influential Scotch gentlemen in this city (Quebec), who, seeing their willingness and industry, have trusted them with provisions and a few other necessaries to enable them to get through the winter. With the exception of this party, all the others were determined to proceed further up the country. Toronto appears to be their halting place. A few had sufficient means to carry them so far, and others disposed of their effects to enable them to reach Montreal, where some obtained employment, but the greater part were forwarded at government expense to Toronto. By a report received from the emigrant agent in that city, forwarded to me by Mr Hawke, it appears that the Scotch weavers are the only immigrants this season who appear to have been unsuccessful. From their want of knowledge of agricultural labour, these immigrants were of little or no use to the farmer; and, in the absence of any public work in that section of the province, they found great difficulty in obtaining employment. Another party of Scotch immigrants, who landed in an equally if not in a more destitute state, were those in the brig Lady Hood, and ship Charles, from Thurso. They are of the agricultural class, and consist of 38 families, 223 persons, from the Western Isles, principally from Lewis, and only two or three of them speak English. Owing to a long and tedious passage, they landed here in great distress, from want of provisions. They all proceeded to settle in the townships of Bury and Lingwick, in the eastern townships, and appear to have emigrated on the invitation of a party of their countrymen, who came out a few years since, and who, although they landed poor and friendless, are now doing well, and placed in comfortable circumstances.

Had these people arrived a month or two earlier in the season, when employment was abundant, they would have no doubt been able to get through the winter with comparative ease, as, during the harvest months, employment was very plenty in that section of the province, and labourers in great demand.

It is of the greatest importance that the advantage of arriving in the colony at as early a period in the season as possible, should be impressed on the labouring portions of the immigrants who come out at their own expense, and also on the landholders who wish to give assistance to their poor tenantry to emigrate, as every thing depends on the time of their arrival here. Those who sail from the United Kingdom in the months of April and May, arrive in time to take advantage of the spring and summer work. They have thus time to look about them, and secure a home for their families against the coming of winter. On the other hand, as in the instance of the last-mentioned party, if emigrants arrive at a season when nearly all employment ceases, the winter approaches before they can get themselves and their families into the interior of the country, and they are thrown on the benevolence of the colonists, or have to drag through a long and severe winter, depending on charity for support.

Although I have represented to your Excellency that a large portion of the emigrants have arrived poor and in distress, still, the number of those whose intelligence and proportionate wealth will add to the value of our colonial population is incomparably greater; and I consider, on the whole, that the emigration of the past season presents the most favourable aspect. The general character and conduct of the emigrants is gratifying beyond description, and I have not heard of a single instance of improper conduct or crime from any of the different agencies throughout the province. This is greatly to be attributed to the increasing influence of the temperance societies, which, I am happy to state, are extending throughout this province."

MANURES.

At a late meeting of the Ashmolean Society, Professor Daubeny exhibited a specimen of Mr Daniell's New Patent Manure, which is stated by the inventor to consist of carbonate of ammonia, sawdust, and bituminous matter. As the materials from which this new kind of fertiliser is drawn appear to consist of inorganic matter exclusively, Dr Daubeny pointed out its discovery as an instance, amongst many others, of the means which nature has placed within our reach for increasing the amount of vegetable produce proportionately to the increase of mankind, and so maintaining the necessary ratio between subsistence and an increasing population. In a purely pastoral or agricultural community, it might be unnecessary to have recourse to any other fertilising substances than those which the manure of animals affords; but in a highly advanced condition of society, in consequence of the large amount of produce consumed by the inhabitants of the great towns, it becomes necessary to seek for new materials to supply the loss which the soil of the country sustains. Thus, bone dust is procured from South America in such quantities, that it is computed, from calculation, that each head of cattle supplies bony matter equal to 34 lbs. in weight; that not less than one million two hundred thousand oxen are slaughtered annually in that country for the supply of bone manure to England alone. Guano, or the dung of sea-birds, is likewise an extensive article of importation for the same purpose; but as both these sources will fail in proportion as the several countries become more peopled, it is fortunate that we may find substitutes for them in inorganic substances. Such is the nitrate of soda, so much used of late; such is the new manure invented by Mr Daniell; and it may be confidently predicted, that, by the discovery of such agents, agriculture will be enabled to keep pace with the increase of population, if the latter be not stimulated by unwise regulations; and that, as animal life increases in a direct ratio to the amount of subsistence, so the nutritious effects of animal manure, by giving greater energy and vigour to the organs of plants, will cause them to draw more abundantly from the atmosphere, and thereby force a proportionately larger quantity of them into existence. Dr Buckland thought that an important principle respecting stimulating manures had been brought forward, namely, that a plant, under their action, draws more freely from the atmosphere. In addition to the increase of human manure with population, the quantity of carbon given out by animals, and left to be absorbed by plants, is proportionately increased. He further adverted to the discrimination necessary to be exercised in restoring artificially land that has been exhausted, and instanced a case furnished by Professor Johnston of Durham, of certain pastures in Cheshire which had become exhausted of their phosphate of lime by its being absorbed into the cheese made with the milk of the cattle fed there, and which were restored by a top-dressing of bone manure.—*Athenæum.*

ENGLISH AND GERMAN GENTLEMEN.

The want of self-respect in the German character, produced by the education and social system, and the undue importance in the German mind of rank, office, and conventional distinction, and undue weight of these in the social economy of Germany, are strongly marked by the profusion of orders, stars, crosses, ribbons, and empty titles with which the people, both of civil and military station, adorn and gratify themselves. Every third man you meet in the streets has a label in his button-hole, telling all the world, "I am a knight; look at me." No very young man among the continental military can have ever heard a bullet whistle in the field; so that, even by this class, no very profound prospect for the ribbon at the button-hole can be claimed, and none at all by the ordinary civil classes who trick themselves out with it *en militaire*. The feeling of personal worth—the pride, it may be—seems unknown to them, which leads the British nobleman, gentleman of high station, or military officer, who may have been honoured with a British or foreign order, to wear it only on particular parade occasions. He feels that he is something without the external testimonial of it. The English gentleman would think it quite as inconsistent with his personal dignity to walk about on ordinary occasions, in the ordinary circles of society, with his stars, crosses, and ribbons plastered on his breast, as with the gazette of the actions in which he had won his distinctions plastered on his back. The German, again, ties his bit of red ribbon even to the button-hole of his dressing-gown; the merchant goes to his counting-house, the apothecary to the barber's shop to be shaved, the professor to his lecture-room, in crosses and ribbons, as if they were going to the levee of the sovereign. The upper classes of society in all countries are said to be very much alike, and to show few of the peculiar distinctive differences which mark the national character in the middle and lower classes of each country. This is a mistake. The English gentleman, from the highest rank to the very lowest that assumes the appellation, is distinguished from the continental gentleman by this peculiar trait of character—his dependence on himself for his social position, his self esteem—call it pride, or call it a high-minded feeling of his own worth. There he stands, valuing himself upon something within himself, and not upon any outward testimonials of it conferred by others. This feeling goes very deep into society in England. * * While every third man is lounging about, as in Prussia, and generally on the continent, with his orders of merit of some kind or other—and many whose general merits would apparently be nothing the worse of the addition of a little industry to earn a new coat to stick their honours upon—the people, be their forms of government what they may, are but in a low social and industrial condition—are ages behind us in their social economy, and in their true social education as free agents and members of the community.—*Laing's Notes of a Traveller.*

HENRY CLAY'S PLANTATION.

We hear much of the liberal opinions of Henry Clay, a member of Congress in the United States. Here is a neat illustration from the work of Friend Sturge, furnished in a letter to the author, by James Cannings Fuller:—"Having a great desire to see the imported cattle on Henry Clay's plantation, I went thither. On approaching the house I saw a coloured man, to whom I said, 'Where wert thou raised?' 'In Washington.' 'Did Henry Clay buy thee there? Wilt thou show me his improved cattle?' He pointed to the orchard, and said that the man who had charge of them was there. As I followed his direction, I encountered a very intelligent-looking boy, apparently eight or nine years old. I said to him, 'Canst thou read?' 'No.' 'Is there a school for coloured people on Henry Clay's plantation?' 'No.' 'How old art thou?' 'Don't know.' In the orchard I found a woman at work with her needle. I asked 'How old art thou?' 'A big fifty.' 'How old is that?' 'Near sixty.' 'How many children hast thou?' 'Fifteen or sixteen.' 'Where are they?' 'Coloured folks don't know where their children is; they are sent all over the country.' 'Where wert thou raised?' 'Washington.' 'Did Henry Clay buy thee there?' 'Yes.' 'How many children hadst thou then?' 'Four.' 'Where are they?' 'I don't know. They tell me they are dead.' The hut in which this *source of wealth* lives was neither as good nor as well-floored as my stable. Several slaves were picking fruit in the orchard. I asked one of the young men whether they were taught to read on this plantation, and they answered, 'No.' I found the overseer of the cattle with a short-handled stout whip, which had been broken. He said it answered both for a riding whip, and occasionally 'to whip off the slaves.' What, my friend, is to be learned from these gleanings at Ashland—from the doings of our mutual friend, Joseph John Gurney's 'dear friend,' Henry Clay, the man who boasts that 'every pulsation of his heart beats high for liberty,' yet is not ashamed to buy men and women at the capitol!—that place which, above all others, ought not to be cursed by the footsteps of a slave. Yet I fear there are not wanting in the abolition ranks men so wedded to political party, that they may be tempted to vote for Henry Clay; serving their party and themselves thereby, and perchance thinking they serve their country."

DISASTROUS EFFECTS OF BANK FAILURES IN IRELAND.

Severe as the distress of all classes was at this juncture, it gave rise to some ludicrous incidents. While it lasted, a gentleman in Cork wanted a leg of lamb, and offered a five-pound note for it, which was refused. In Limerick, a country gentleman, with L.1500 a-year, had sent invitations out for a dinner-party the week the banks broke, and considered himself most fortunate on finding among his notes one Bank of Ireland note for ten pounds. No one doubted the goodness of the note, but no one could give change for it. Ten pounds, in gold or silver, were not in the county; and as for credit, there was none to be had. In this extremity, with money—which was not money—and without credit, having tried butcher, baker, and confectioner in vain, the gentleman gave up the idea of his dinner-party in despair, and wrote to his friends to keep the engagement standing until he could procure cash or credit for a ten-pound note.—*Hardcastle on Banks and Bankers.*

MODERN EDUCATION.

"You're good for nothing." "I am indeed," murmured poor Miss Priscille, with a gentle shake of her head, and a low slow sigh of acquiescence. Alas! as she ran over the catalogue of her accomplishments, the more she remembered what she could do for her sick parent, the more helpless and useless she appeared. For instance, she could have embroidered him a nightcap—

> Or netted him a silk purse—
> Or plaited him a guard-chain—
> Or cut him out a watch-paper—
> Or ornamented his braces with bead-work—
> Or embroidered his waistcoat—
> Or worked him a pair of slippers—
> Or open-worked his pocket-handkerchief.

She could even—if such an operation would have been comforting and salutary—have rough-cast him with shell-work—

> Or coated him with red or black seals—
> Or encrusted him with blue alum—
> Or stuck him all over with coloured wafers—
> Or festooned him——

But, alas! alas! alas! what would it have availed her poor dear papa, in the spasmodics, if she had even festooned him, from top to toe, with little rice-paper roses!—*Hood in New Monthly.*

[The above is a fair quiz on the trifling and useless kind of education imparted to young ladies at many fashionable boarding-schools in the south. Its writer is most likely unacquainted with the prodigious advance latterly made in female instruction and training, at such establishments as the Scottish Institution for the Education of Young Ladies, Edinburgh.]

A WORD FOR BOOK-BORROWERS.

Those who have collected books, and whose good-nature has prompted them to accommodate their friends with them, will feel the sting of an answer which a man of wit made to one who lamented the difficulty which he found in persuading his friends to return the volumes which he had lent them. "Sir," said he, "your acquaintances find, I suppose, that it is much more easy to retain the books themselves than what is contained in them." I would just observe here, that nothing can be more mean and unkind than to borrow books of persons, and to lose them, as is too frequently the case. If my friend gratifies my request in lending—if, by so doing, he saves me the expense of purchasing—or if, also, by the loan, I gain considerable information or intellectual profit—it is base and ungrateful either to suffer the book to be injured, or not to return it. I give this as a hint to some who are more in the habit of *borrowing* than *returning* books.—*Buck's Anecdotes.*

CONTEMPORANEOUS APPLAUSE.

Great minds had rather deserve contemporaneous applause, without obtaining it, than obtain, without deserving it; if it follow them, it is well, but they will not deviate to follow it. With inferior minds the reverse is observable; so that they can command the flattery of knaves while living, they care not for the execrations of honest men when dead. Milton neither aspired to present fame, nor even expected it; but (to use his own words) his high ambition was, "to leave something so written to after ages, that they should not willingly let it die." And Cato finely observed, he would much rather that posterity should inquire why no statues were erected to him, than why they were.—*Lacon.*

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row.

Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

CHAMBERS'
EDINBURGH JOURNAL

NUMBER 541. SATURDAY, JUNE 11, 1842. PRICE 1½d.

SOME IDEAS RESPECTING SELF-ESTEEM.

THE utility of a just self-respect, in maintaining right conduct and protecting against undue aggression, is sufficient evidence of the wisdom of Providence in planting this as a primitive feeling in human nature; but perhaps there is none of the human faculties of which the disproportions allowed to individuals occasion such a striking variety of manifestations. Let the following two cases speak for themselves:—

Some years since, whilst walking with a respectable merchant in the town of Hull, my attention was attracted by a short, dirty, little fellow, with coat worn at the elbows, shoes that had never been made to fit him, and a remnant of a hat, placed on the dexter side of his head. He was strutting in a most ridiculous manner, with his hands in his pockets, and with the air of one who evidently thought very highly of himself. As we passed him, he bowed somewhat haughtily to my companion, and, in a patronising tone, said—"How do you do, George?"—when, to my surprise, the rich merchant responded, in a similar strain and manner, thus—"Ha! Bill—how are you?" On my inquiring who this little eccentric creature might be, I was told—"That he was too proud to work, but that he would take money from those whom he condescended to call his friends and equals; that he never slept in a bed, but chose, as his dormitory, hackney coaches, hay-lofts, or any place of easy access, where nothing was expected for the accommodation; that he occasionally obtained 'voluntary contributions' by spouting pieces from plays to the company of tap-rooms; and that he had been engaged to exhibit his histrionic powers with a company of strollers, before some rural admirers of the drama, in barns, &c." My informant added—"Spurzheim should see his head; for if he has not a large bump of self-esteem, there is not a particle of truth in his science." My own attention being thus directed to this person, I took every opportunity afforded by my temporary sojourn to obtain some little more information about him. Sometimes I met him walking arm in arm with a smart officer from the garrison—the one with a fine laced coat, and all the gay trappings of the military man, contrasting with the torn and shabby habiliments of the other; sometimes he might be seen fastening on some professional man, and if he did not talk very learnedly, he did very loudly. Every one seemed to humour and encourage his absurdity, and to derive amusement for themselves from his consummate pride and most ridiculous egotism. He was called "General Davies," but his real name I never heard. This cognomen he had been known by for many years; for, so early did he manifest his inordinate self-esteem, that, when a boy, his contemporaries, imitating the loyalty of their parents, formed themselves into a local militia, and this Davies, the poorest lad among them, would be nothing else than "general;" and whether to be amused with his eccentricity, or because he showed an overbearing manner to the juvenile soldiers, true it is that he held the rank he aspired to, and has retained the title ever since.

The other case is one of a comparative deficiency of that true estimate of self which is essential to give tone and vigour to the mental faculties, rendering them useful to others as well as to ourselves.

Mr Jenkins was a very accomplished general practitioner, having read hard, and attended all the lectures with diligence and attention, yet he never succeeded in his profession; and this arose from there being something in his manner which destroyed all confidence: he was hesitating and wavering, as if he had had no decided opinion on any subject, or any experience to warrant his forming one. When he was called to attend an invalid, his deficient self-esteem was too obvious not to be matter of comment and reflection to the most commonplace minds. When asked a question, instead of speaking in the first person singular, he would either answer—"We are informed that these symptoms indicate such a form of the disease;" or, "The best medical writers assert so and so," &c. This want of dependence on his own judgment marred his success, and often excited a feeling of contempt for his mental qualifications in those who decide from mere manner, or whose own acquirements were but superficial. If his professional brethren thought more favourably of his knowledge, they would express their pity for him, which had a tendency still more to degrade him, so far as the public was concerned. Nor could it be otherwise; I have often seen him in a sick-room look as if he did not know what to do. If asked the nature of a disease, or the treatment he thought necessary to subdue it, instead of giving the querist a direct answer, he would turn to some non-professional person, or to the nurse, and say—"Don't you think it is so and so?" &c. Often, in common every-day affections, instead of relying on his own information and details of practice, being well qualified to do so, he would say—"I think it would be better to call in Dr —— for his opinion:" hence, if the patient recovered, the latter had the merit of the cure; but if the disorder terminated fatally, then the practice of poor Jenkins was implicated, and his indecision and want of self-confidence made a subject of severe animadversion and detraction. So that, instead of rising in public estimation, the longer he was in business, as is generally the case, he retrograded; and death to him was a fortunate event, sparing him from further and worse sufferings from the pity or contempt of the public.

These anecdotes show forcibly how independent pride is of circumstances. Many recognise pride only in fine clothes, fine accommodations, and fine equipages and retinues; but those who enjoy such things are often of genuinely humble nature, from their chancing to be endowed with little self-esteem, and only are surrounded with elegances through the favour of fortune; while, on the other hand, individuals in humble circumstances are sometimes found to be inspired with the most extravagant self-esteem. The pride of General Davies is no solitary instance. The philosopher whom my Hull friend referred to, first had his attention drawn to this section of our mental organisation by a beggar at Vienna—a man who had been born in respectable circumstances, but, being too proud to work, had sunk into the lowest of all conditions. This man walked with precisely the same air as a particular councillor of the emperor who was known to be excessively proud; and this was what first attracted the notice of the philosopher. The union between pride and poverty is a thing familiar to the world—that between affluence and the true spirit of humbleness and gentleness has been much less remarked, but is not less a truth. The first is one of the most difficult of all things to deal with. Humble wealth might lick the dust beneath the feet of proud poverty, without soothing or conciliating it. When to the first is added the spirit of rudeness, it becomes utterly insufferable—for instance, the greater pride of Diogenes in trampling on the pride of Plato; or such an effusion as the following, addressed by the late William Cobbett to the Bishop of Winchester:—"Bishop—I have some remarks to make on the letters above mentioned, and I think proper to address these remarks to you; because, in the first place, you have great power and possessions in that part of the kingdom *in which I was born;* in the next place, because you are an author, and therefore one of us. * * For these reasons, I address myself to you upon this occasion; and, for the same reasons, *I shall treat you with very little ceremony,* though you have three palaces, and are the lord of perhaps more than twenty manors. In your pamphlet above alluded to, you complain that there is among the people a want of proper respect for superiors; but *I am your superior. I have ten times your talent, and a thousand times your industry and zeal.* From *my* pen have gone forth twelve sermons; and more than a hundred and fifty thousand (taking each singly) copies of these sermons have actually been printed and sold; and there are now more of them (in a volume) sold every year than the total amount of the sale of any single sermon that you, or any of your clergy, ever sent from the press. There is not one of these sermons which has not, *in my opinion,* done more to mend the morals of the people than all the sermons that you ever wrote or ever preached, or that you would be able to write or preach to the age of Methuselah. Who, then, best deserves the palace and park that overlook my native town of Farnham—you or I? Put your hand to your heart, bishop, and answer this question." Such persons think they are acting with proper spirit, when they are only indulging, without rational restraint, one of the most selfish of their feelings.

Self-esteem is as independent of gifts and attainments as of worldly circumstances. Many an author of the poorest quality have I met with, who had a far higher opinion of himself than ever could be traced in the late Sir Walter Scott. I lately encountered one who had yet published nothing, but had prepared a work which he designed to publish, and for which he expected a success infinitely transcending that of any production of the present age. He held all the masters of his art, Scott, Bulwer, Dickens, &c., in the greatest contempt, and, to do him justice, he was deeply and exactly conversant with all their defects, on which he insisted in eloquent terms. He made no secret of his expectation to place himself far above them all. His book has since been published; but no individual of the insensible public has ever bought a copy, and not a single review has thought it worthy of notice. Sitting in the critical chair generally brings out the self-esteem of literary men in the strongest light. In the humblest works that pretend to review literary productions, one shall find men, known through private channels to be of no consideration themselves, pronouncing judgments on good authors with an air of not only superior wisdom, but of something like superior nature—as, for instance, in the following passage, which is a genuine extract from a review which appeared a few years ago in a provincial periodical, being probably the production of some person of not the least note. The book reviewed was a new volume of an encyclopædic work; and the writer makes reference, it will be observed, to a former counsel, which had not been attended to. "This is the way," says our critic, "in which *we thought* the author should have treated his subject; and we urged it the more, because *we believed* that he was well able to treat it so. If he will not take *our advice, which we give in all kindness,* he must be contented to take his place in the crowd of mere collectors, instead of joining the ranks of men of science." I am Sir Oracle, and when I ope my mouth, &c. It is perfectly delightful to contrast this arrogance with the humility of the great fictionist of our times. Scott had remarkably little self-esteem, and, on the contrary, a great deal of the submissive and venerative

feeling, which seems to be its opposite. He never once, perhaps, in his whole life, made an unprompted observation on his own works. On the other hand, he over-estimated the productions of others, insomuch as to wring from Mr Constable the well-known exclamation—"Give me as many as possible of the books that Scott writes himself, but save me from the books which he recommends!" See, also, in his "Lives of the Novelists," what more than justice he has done to all his predecessors in prose fiction. Certainly, whatever might be Scott's faults—and there has not lately been any tendency to extenuate them—an envious or detractive spirit was not of the number.

With nations the same rule holds good. The Greeks were proud, and called all other nations barbarians. In their case, if ever, the feeling was justifiable; but it flourishes equally where it is only ridiculous. I insist not on the case of the Chinese, who certainly have made some advance in arts and letters, as compared with their neighbours. But observe the Chippeweyans of North America, who call themselves exclusively "The People," whilst they designate all other nations by their particular country—or the Esquimaux, who term themselves *Innuee*, or Mankind, and look to Southampton Island as a place full of wretched savages not worthy to be considered as of the same species. The Caribs had an equally high conceit of themselves; and now, poor creatures, not one of the race exists.

Self-esteem is the leader sentiment of human nature. No one who has had opportunities of observing a family of young children, can have failed to distinguish the particular one, whose superior self-esteem made him the self-constituted lord over the rest. In a group of village children, there is always in like manner one who seems naturally to become the leader. So it is also in gangs of poachers, or of banditti, and in savage tribes. Generally, in these instances, superior intellect or physical power aids in giving the ascendancy, but not to a great extent. A wide distinction between such associations, and those which exist in civilised and peaceful communities is, that in the latter, self-esteem is less, and superior qualification more, the cause or source of a governing power being vested in any particular person. There it often happens that the ruler or functionary has much less self-esteem than the obscure malcontent who employs himself in finding fault and creating disturbance. Indeed, it is very frequently this simple feeling which causes disaffection; it is indisposed to submit, and would itself fain be master. Often has the king, who walked from his inauguration with his crown on his head and his robes on his shoulders, borne a humbler heart than the demagogue who stood in the kennel and railed at him. Espartero, the Regent of Spain, is a remarkable example of a man raised to supreme power by natural qualities and the favour of circumstances, while possessing little of that faculty which almost solely constitutes the leaders of rude communities. I have been informed by a gentleman acquainted with him, that his manner in coming into a room of state, where all are prepared to pay him obeisance, presents a striking example of the shambling, diffident demeanour of men who have little self-esteem; insomuch that the vice-regal character sits rather awkwardly upon him. At the same time, of the firmness of Espartero there can be no room to doubt, from all that we see of his government.

The meanness of which pride is sometimes found capable, is a very remarkable feature of human character. We see it make men become absolute beggars, in order to avoid the supposed degradation of a useful calling. We see it make the proud high-born put up with almost every kind of unseen humiliation incidental to poor circumstances, and even become the onhangers of those who despise them, rather than taint their name and their ideal dignity by condescending to merchandise. Haughty dogs do verily contrive sometimes to sit down to amazingly dirty puddings. For example—what, though it occurs in a fiction, we cannot but deem a genuine trait of life—the willingness of the Hidalgo, in *Guzman d'Alfarache*, to stomach the remains of a supper actually begged by his half-starved valet! This is a phenomenon more easily accounted for than might be at first supposed. Pride, in such instances, creates such a perfect assurance of the impossibility of *self*-degradation, that it allows itself to do any thing.

We return to repeat the remark, that the true use of self-esteem in the human constitution is to give that sense of self-respect which tends to maintain right conduct and repel unjust aggression. We should therefore only deprecate any great extreme of this feeling; whilst, at the same time, reflection will convince us that no great actions can be performed without a proper sense of pride—that every real and sound friend of his species—those, for example, who have suffered for their advocacy of the great principles of civil and religious liberty—must have had self-esteem, or truth would have been sacrificed in deference to established opinions, and the best and soundest principles would have been immolated on the altars of selfish prejudices. The proud conscientious man is sure to act honestly. We should therefore only deprecate pride when its all-engrossing tendencies swallow up the better faculties, and when it exercises a fearful potency over every action, rendering the possessor overbearing, immoral, and ignorant. Such a one we may dread to associate with under any circumstances, because no moral consideration will restrain the unmollified yearnings of his animal propensities. Every action is instigated by selfish considerations. If any one should offend such an individual, he holds a judicial proceeding, and constitutes himself both judge and jury, and there is no appeal against his verdict; and woe be unto the poor wight who is in the power of such a person, as summary and vindictive punishment is sure to be inflicted. But if the mental court of a proud man is regulated by a cultivated intellect and a sound code of morality, then a righteous judgment may be expected. The appellant will have a patient hearing, and every mitigating circumstance will be investigated; motives will be examined, and justice will be done, from the decision being dependent on the evidence which may have been submitted, and not merely on impulsive sensations of personal wrong.

GOLDEN HAIR.

Golden hair, or any thing having a pretension to rank under that name, is extremely rare now-a-days among the sons and daughters of men. Yet it has been much talked of. All the old poets, Greek and Roman, are fond of adorning their heroes and heroines, more particularly the latter, with tresses of this brilliant hue. Was the attribute more common in those days than now? Probably not. The number of real and historical characters who have been decorated by nature with golden hair, appears to be very limited indeed. One of those so endowed was Lucretia Borgia, the too famous daughter of Pope Alexander VI., and a renowned beauty in her time. The truth of the matter is put beyond all doubt, by the preservation of one of her tresses in the Ambrosian Library of Milan. Leigh Hunt tells us that he possesses a single hair from this tress, stolen by a "wild acquaintance" from the valued relic. "On the envelope," says Mr Hunt, whom we must allow to speak for himself here, "my wild acquaintance put a happy motto—

'And beauty draws us with a single hair.'

If ever hair was golden, it is this. It is not red, it is not yellow, it is not auburn; it is *golden*, and nothing else; and though natural-looking too, must have had a surprising appearance in the mass. Lucretia, beautiful in every respect, must have looked like a vision in a picture—an angel from the sun. Every body who sees it, cries out, and pronounces it the real thing. Wat Sylvan [Mr W. Savage Landor], a man of genius, whom I became acquainted with over it, as other acquaintances commence over a bottle, was inspired on the occasion with the following verses:—

'Borgia, thou once wert almost too august
And high for adoration—now thou'rt dust!
All that remains of thee these plaits enfold—
Calm hair meandering with pellucid gold!'"

We are tempted to think that we have found another authentic case in the work called the *Memorie of the Somervills*—a curious family memoir written by a Lord Somerville in the reign of Charles II. The entire passage in which the notice occurs may be extracted, as presenting what we think a very delightful description of individual and real beauty. It relates to the wife of the author, born Martha, daughter of Bannatyne of Corehouse:—"It is proper in this place to give a description of her persone and qualifications, both being excellent; to begin with the first, att her age of fyfteine compleat, she attained to her full height, which was soe farre above the ordinary stature of most women, that she was accounted amongst the tallest of our nationе, but soe as that diminished nothing of her handsomenesse, every part answering thereto; her visage was long, her nose high, her brow bent and smooth as alabaster, her chin and cheeks somewhat full, with a little read, especially in hott weather; ther was nothing boor soe litle proportione with the rest of her body as her hand and foot, both being extremely litle, but weill shapen, whyte, and full of flesh; her skin was smoothe and clear, but what was covered, not soe whyte as I have seen severall of her complexione that was purely sanguinean; her hair being of a *bright flaxen*, which *darkened* as she grew in age, added much to her beauty, wherin ther was no blemish, her mean being answerable to that, and her persone gave occasione to these that saw her at church, or any other public meeting, to ascert she graced the place and company where she was. It has often been observed, that when this gentlewoman walked upon the street (which was but upon occasione, being better imployed at home), that the eyes not only of the men, but also of these of her oune sex, was upon her, soe farre as ther sight could serve them, admireing her parts and handsomenesse. If any should questione the truth of what I have written concerning the persone of this young lady, ther are thousands yet alive both in Clidesdale, wher she was born and brought up, and lived some years when in a married estate, and in Mid-Lothian, her residence thereftir, where she lived some thretteine years, and therin dyed, that will give the same testimony of her persone, features, and beauty.

For the induements of her mynde, they wer answerable to the excellency of the cause, as being of a quick apprehensione, strong judgement, a ready delyverie, albeit she had a little haugh [hesitation] in utterance, which was soe farre from makeing it unpleasant, that it graced her speech, and was very takeing with these she conversed with; in a word, she was pious towards God, obedient to her parents, loveing and submissive to her husband, and obledgeing to the meanest of his relations; indulgent towards her children, frugall in careing for her familie, charitable to the poor, and courteous to all persons whatsomever."

We have mentioned that the Greek and Roman poets were liberal in ascribing golden locks to the favourite creations of their fancy. Our own poets have been so also; as, for example, Chaucer, who says of a lady that appeared to him, and won his heart, in a dream—

"For every hair upon her head,
The sooth to say it was not red;
Nor yellow, nor yet brown it n'as,
Methought most like to gold it was."

Collins, in his fine personification of Hope, gives her, it will be remembered, a head ornament of the kind under consideration—

"And Hope, enchanted, smiled, and waved her golden hair."

A contemporary of his, the writer of the ballad of *Gil Morris*, as printed by Percy, confers this magnificent ornament on his hapless hero, contributing to the engaging effeminacy of the picture—

"His hair was like the *threeds of gold*
Drawne frae Minerva's loome;
His lipps like roses drapping dew,
His breath was a' perfume."

But to take the words of dreaming poets on such a subject is not our purpose here, and we therefore proceed to give another of the few historical and authentic instances of the occurrence of golden hair which we have met with in our course of reading. It is that of Beatrice Cenci, an Italian lady, whose deplorable story has been made the subject of a tragedy by Percy Bysshe Shelley. "Beautiful exceedingly" in all respects, Beatrice had also the ornament of golden hair. The manuscript which narrates her fate thus describes her:—"Beatrice was of a make rather large than small. Her complexion was fair. She had two dimples in her cheeks, which added to the beauty of her countenance, especially when she smiled, and gave it a grace that enchanted all who saw her. Her hair was like threads of gold; and because it was very long, she used to fasten it up; but when she let it flow loosely, the wavy splendour of it was astonishing. She had blue eyes, very pleasing, of a sprightliness mixed with dignity; and in addition to all these graces, her conversation, as well as all that she did, had a spirit in it, and a sparkling polish, which made every one in love with her. She was then under twenty years of age." Shelley himself saw the portrait of Beatrice Cenci, and says—"Her hair is bound with folds of white drapery, from which the yellow strings of her golden hair escape and fall about her neck."

Burns's "Lassie wi' the Lint-white Locks" could not, we suspect, make any pretensions to a place among the golden-haired. No modern poets, in fact, say much about golden hair, and this is perhaps a sign that truth is insinuating itself, of late days, even into poetry. Any one, however, who wishes to see a fine description, in fiction, of a golden-haired girl, may turn to the experiences of Richard Taylor (story of Mary Anne's Hair), in the early numbers of *Tait's Magazine*, where the supposed possession of such an ornament is turned to fine account. We have heard of several cases of girls in humble life, who had hair of the hue of gold, and received considerable sums, every year or two, by selling the surplus quantity. We believe, indeed, that, in the palmy days of female wigs, such sales were not uncommon.

PROFESSOR JOHNSTON ON THE RELATION OF GEOLOGY TO AGRICULTURE.

Soils being formed (by weathering or natural dissolution) out of the rocks on which they rest, their character, with a regard to the purposes of the agriculturist, depends on the constitution of those rocks. It therefore becomes of great consequence to know the constituent materials of rocks, as well as their arrangement and geographical situation—a branch of knowledge which falls within the department of the geologist. We find the relation which thus subsists between geology and agriculture briefly, intelligibly, and most convincingly explained in a small treatise* recently published by Professor Johnston of Durham, a young cultivator of science, who seems to delight in turning his studies to a practical account, and for whom, if we are not greatly mistaken, there waits an enviable reputation in and out of his country. Mr Johnston's treatise gives also a view of the relations of chemistry to agriculture; but this is a subject on which we have often before addressed our readers.

The first lesson in agricultural geology is, to observe how rocks are disposed on the surface of the earth. Let this be briefly stated for the sake of the altogether ignorant. Some rocks exist in great mountainous masses—forming in reality the bulk of huge mountain ranges—and in these nothing like the bed-structure or stratification is to be traced. They are, in fact, the ridges or upper parts of masses which stretch to an unknown distance into the earth. Upon the sunk parts of these rocks rest others, which take the form of layers, beds, or strata; all of them distinguished by peculiar constitutional characters, but each kind found in a certain place in an invariable

* Elements of Agricultural Chemistry and Geology. Blackwood and Sons, Edinburgh and London.

order of supraposition; some one or other being at the surface, sometimes with the flat side lying along, sometimes with the edge presented upwards; all under the superficial stratum in the order being probably present below, and all those higher in the order being absent. Where a stratified rock, or a certain kindred group of stratified rocks, lies for a great way flat, or comparatively flat, as is often the case in extensive valleys, one character of soil obtains over a large surface; in other places, the beds lying more or less edgewise, we may pass over various characters of soils in the space of a short walk. It is further to be observed, that as the dust of one kind of rock is liable to be washed or otherwise transported, in whole or in part, to a distance from its native seat, it may sometimes happen that a soil is not strictly of the character which might be argued from that of the subjacent rock; but it is generally so; and such cases as those are to be held only as exceptions, against which the skilled agricultural geologist requires to be upon his guard.

Now, all rocks whatever are formed of a limited range of materials; and what makes them so different from each other is simply their having the materials in different proportions, or in having individually some of the materials and wanting others. The materials of some are much better calculated than others to form a soil which will be productive or improvable. Hence, when we know the rock below the soil, we may form a tolerably confident augury as to the *value* of the soil for purposes of rural economy. Mr Johnston very justly remarks—"If the agricultural geologist be informed that his friend has bought or is in treaty for a farm or an estate, and that it is situated upon such and such a rock, or geological formation, he can immediately give a very probable opinion in regard to the agricultural value of the soil, whether the property be in England, in Australia, or New Zealand. If he knows the nature of the climate, also, he will be able to estimate with tolerable correctness, how far the soil is likely to repay the labours of the practical farmer; nay, even whether it is likely to suit better for arable land or for pasture; and if for arable, what species of white crops it may be expected to produce most abundantly. These facts are very curious, and illustrate beautifully the value of geological knowledge—if not to A and B, the holders or proprietors of this and that small farm, yet to enlightened agriculturists, to scientific agriculture in general. To those who are now embarking in such numbers in quest of new homes in our numerous colonies, who hope to find, if not a more willing, at least a more attainable soil in new countries, no kind of agricultural knowledge can at the outset—I may say, even through life—be so valuable as that to which the rudiments of geology will lead them. Many who prepare themselves [as they think] for becoming farmers or proprietors in Canada, New Zealand, or in wide Australia, leave their native land without a particle of that preliminary *practical* knowledge which would qualify them to say, when they reach the land of their adoption—'On this spot rather than that, in this district rather than that, will I purchase my allotment; because, though both appear equally inviting, yet I know, from the geological structure of the country, that here I shall have the more permanently productive soil; here I am more within reach of the means of agricultural improvement; here, in addition to the riches of the surface, my descendants may hope to derive the means of wealth from mineral riches beneath.' And this oversight has arisen chiefly from the value of such knowledge not being understood—often from the very nature of it being unknown, even to otherwise well-instructed practical men."

We shall now briefly run over the characters of the soils of the different rocks, partly using Mr Johnston's language and partly our own.

Commencing with the uppermost rocks, and going downwards—the *Tertiary Strata*, which exist near London and some other parts of England, but are wanting in Scotland and Ireland, are "stiff, almost impervious, dark clays," chiefly fitted for pasture, unless in the lower beds, which, being mixed with sand, produce an arable soil. The upper beds of the *Chalk* make a poor soil, chiefly serviceable for pasture; the lower make a good corn soil. So fully is the superiority of the lower beds acknowledged, that in some parts of Suffolk, where the former prevail, they bring soil from the lower beds in Kent by sea, to strew over their lands. "The *Green Sand*, 500 feet thick, consists of 150 feet of clay, with about 100 feet of sand above, and 250 feet below it. The upper sand forms a very productive arable soil; the clay impervious, wet, and cold lands, chiefly in pasture; the lower sand is generally unproductive. It is an important agricultural remark, that where the clay (plastic clay) comes in contact with the top of the chalk, an improved soil is produced; and that where the chalk and the green sand mix, extremely fertile patches of country present themselves. The *Wealden Formation* is only good where the marls and limestones, partly composing it, come to the surface.

Of the *Oolite*, so conspicuous in England, the *Upper* is only good "where the sandy limestone beds rest upon and are intermixed with the clay." The *Middle* gives good arable land where the limestones happen to abound; the pure clays are heavy to work, and chiefly fitted for pasture. Of the *Lower* it may also be said, that the predominance of the sandstone and limestone is requisite to create a good arable soil. The *Lias*, being a pure clay, is chiefly for pasture.

The *New Red Sandstone* formation [by formation is meant a kindred group of strata] "consists of red sandstones and marls—the soils on which are easily and cheaply worked, and form some of the richest and most productive arable lands in the island. In whatever part of the world the red soils of this formation have been met with, they have been found to possess in general the same agricultural capabilities." The soil of the *Magnesian Limestone* bears naturally a poor pasture, and is only capable of being improved into arable land by "high farming."

"The *Coal Measures* [another term for a group of strata], from 300 to 3000 feet thick, consist of beds of sandstones and dark blue shales (hard clays), intermingled (*interstratified*) with beds of coal. Where the sands come to the surface, the soil is thin, poor, hungry, sometimes almost worthless. The shales, on the other hand, produce stiff, wet, almost unmanageable clays—not unworkable, yet expensive to work, and requiring draining, lime, skill, capital, and a zeal for improvement, to be applied to them, before they can be made to yield the remunerating crops of corn they are capable of producing. To the *Millstone Grits*, of 600 feet or upwards in thickness, the same remarks apply. They are often only a repetition of the sandstones and shales of the Coal Measures, forming in many cases soils still more worthless. Where the sandstones prevail, large tracts lie naked, or bear a thin and stunted heath; where the shales abound, the naturally difficult soils of the coal shales again recur. These rocks are generally found on the outskirts of our coal-fields.

The *Mountain Limestone*, 800 to 1000 feet thick, is a hard blue limestone rock, separated here and there into distinct beds by layers of sandstones, of sandy slates, or of blue shales like those of the Coal Measures. The soil upon the limestone is generally thin, but produces a naturally sweet herbage. When the limestone and clay (shale) adjoin each other, arable land occurs, which is naturally productive of oats, yet, when the climate is favourable, capable of being converted into good wheat land. In the north of England, a considerable tract of country is covered by these rocks, but in Ireland they form nearly the whole of the interior of the island.

The *Old Red Sandstone* varies in thickness from 500 to 10,000 feet. It possesses many of the valuable agricultural qualities of the New Red, consisting, like it, of red sandstones and marls, which crumble down into rich red soils. Such are the soils of Brecknock, Hereford, and part of Monmouth; of part of Berwick and Roxburgh; of Haddington and Lanark; of southern Perth; of either shore of the Moray Firth; and of the county of Sutherland. In Ireland, also, these rocks abound in Tyrone, Fermanagh, and Monaghan; in Waterford, Mayo, and Tipperary. In all these places, the soils they form are generally the best in their several neighbourhoods; though here and there, where the sandstones are harder, more siliceous, and impervious to water, tracts, sometimes extensive, of heath and bog occur.

The *Upper Silurian system* is nearly 4000 feet in thickness, and forms the soils over the lower border counties of Wales. It consists of sandstones and shales, with occasional limestones; but the soils formed from these beds take their character from the general abundance of clay. They are cold, usually unmanageable, *muddy* clays, with the remarkably inferior agricultural value of which the traveller is immediately struck, as he passes westward off the Red Sandstones of Hereford on to the Upper Silurian rocks of Radnor. The *Lower Silurian* rocks are also nearly 4000 feet in thickness, and in Wales lie to the west of the Upper Silurian rocks. They consist of about 2500 feet of sandstone, on which, when the surface is not naked, barren heaths alone rest. Beneath these sandstones lie 1200 feet of sandy and earthy limestones, from the decay of which, as may be seen on the southern edge of Caermarthen, fertile arable lands are produced.

The *Cambrian system*, of many thousand yards in thickness, consists in great part of clay slates more or less hard, which often weather slowly, and almost always produce either poor and thin soils, or cold, difficultly manageable clays, expensive to work, and requiring *high farming* to bring them into profitable arable cultivation. Cornwall, western Wales, and the mountains of Cumberland, in England—the high country which stretches from the Lammermuir hills to Portpatrick, in Scotland—the mountains of Tipperary, and a large tract on the extreme south of Ireland; on its east coast, and far inland from the Bay of Dundalk—are covered by these slate rocks. Patches of rich, well-cultivated land occur here and there on this formation, with much also that is improvable; but the greater part of it is usurped by worthless heaths and extensive bogs.

The *Mica Slate* and *Gneiss systems* are of unknown thickness, and consist chiefly of hard and slaty rocks, crumbling slowly, forming poor thin soils, which rest on an impervious rock, and which, from the height to which this formation generally rises, are rendered more unproductive by an unpropitious climate. They form extensive heathy tracts in Perth and Argyle, and on the north and west of Ireland. Here and there only, in the valleys or sheltered slopes, and by the margins of the lakes, spots of bright green meet the eye, and patches of a willing soil, fertile in corn."

Mr Johnston draws the following conclusions:—"1. That some formations, like the New Red Sandstone, yield a soil almost always productive; others, as the Coal Measures and Millstone Grits, a soil almost always *naturally* unproductive. 2. That good—or better land at least, than generally prevails in a district—may be expected where two formations or two different kinds of rock meet—as when a limestone and a clay mingle their mutual ruins for the formation of a common soil. 3. That in almost every country, extensive tracts of land, on certain formations, will be found laid down to natural grass, *in consequence of the original difficulty and expense of working*. In raising corn, it is natural that the lands which are easiest and cheapest worked should be first subjected to the plough; it is not till implements are improved, skill increased, capital accumulated, and population presses, that the heavier lands will be rescued from perennial grass, and made to produce that greatly increased amount of food for both man and beast which they are easily capable of yielding."

In addition to the varieties of rock already specified, there is a kind of what may be called an eccentric character, as far as arrangement is concerned, being found in masses and thin partitions amongst and bisecting other rocks, into which positions it has apparently been thrown in a molten form from below. This is *Trap Rock* (basalts and greenstones). In granite, felspar, the parent of clay, unites with quartz; in trap, with hornblende, in which there is much lime, magnesia, and oxide of iron. Granite soils are generally unfruitful; and the plains below mountain ranges of this rock are often unfruitful also, in consequence of being overspread with the drift of the felspar clay. But a trap soil, from its containing (through the hornblende) so much of the "inorganic constituents which plants require for their healthy sustenance," proves generally more productive. In some instances, as in the Scilly Isles, the granite contains hornblende also, and is thereby rendered fertile.

We trust that this scanty outline of the agricultural characters of the various rocks will be sufficient to inspire a wish in many minds to study the subject more deeply. It is clearly one of the greatest practical importance, and particularly so to all who have occasion either to purchase or lease land, whether in this country or the colonies. We could not well, indeed, over-estimate the importance of either geology or chemistry to those whose business is with the soil. All such persons ought to give their minds in some measure to both studies. We observe that Professor Johnston has afforded opportunities of doing so in a series of lectures, in which the subjects are treated more largely than in the present volume, and which are published at a cheap rate. But even this small pocket manual may be sufficient for the purpose with a large class of minds, as it presents both subjects in a remarkably clear manner, without any scientific difficulties or details that could tend to occasion the least perplexity.

PLEASANT PROCEEDINGS AT A FACTORY.

THE masses of factory population, growing, as they do, beyond the reach of many of the established moral agencies, have formed a remarkable problem in our national condition for many years past. Alarms of a most extravagant nature have been entertained on this subject, as if factory people were something different from other human beings—utterly destitute of that element of good which, resting in human nature itself, is the true conservative principle of all society. For our part, we neither can regard the factory population as so much of an anomaly as some writers have represented it, nor can we believe that there would be so much difficulty as some apprehend in making the factory and its neighbourhood a scene of happiness and refinement. Whitfield brought good feeling from the rocky hearts of the colliers of Kingsdown by one or two sermons: who can despair of right moral influences while the subjects of the experiment wear the human form? Already, several most encouraging experiments have been made upon the factory population. We shall not here discuss which is the best kind of influence that can be exerted amongst them, but we can show that at least one kind, whatever be its relative merits, has been tried with good effect. We allude to the already partially known proceedings of the Messrs Greg at Bollington, in Cheshire. Two letters from Mr S. Greg to Mr Leonard Horner, Factory Inspector, which were printed for private circulation, contain a most interesting as well as modest account of these proceedings, though not to a very recent date, the first letter having been written in 1836, and the second in 1838. We shall endeavour to present a condensed and connected view of the contents of these letters.

Mr S. Greg states, that he and his partners commenced business at Bollington Mill in 1832, and by 1834, had the works in full operation. They had no theoretical views as to the capabilities of their people, but they seem to have entertained genuinely kind feelings towards them. Mr S. Greg was sensible of the moral evils of the condition of factory people—as low company, neglect of home and domestic duties, frequenting of public-houses, and seeking for pleasure in vulgar and brutalising amusements of various kinds.

He also felt strongly the need for an improvement in their manners towards each other. On this last point he makes some remarks, in which we most cordially concur:—"The gentleness, the tenderness, the delicacy, the patience, the forbearance, the fear of giving pain, the repression of all angry and resentful feelings, the respect and consideration due to a fellow-man, and which every one should be ready to pay, and expect to receive—what is all this but the very spirit of courtesy?—what is it but the very spirit of Christianity? And what is there in this that is not equally an ornament to the palace and the cottage, to the nobleman and the peasant?" Mr Greg likewise perceived that the low habits of many of the factory men are but *forms* of the evils of their condition. He sought deeper for the *sources*, and found these, as he believed, in the "having nothing to supply that want of our nature which demands recreation after toil, as well as toil to give relish to recreation; nothing to occupy the thoughts, which insist on being occupied with *something*; nothing for him to pursue who is by nature an animal of pursuit; nothing innocently to engage the affections which absolutely refuse to be left void. This," he continues, "is the real evil—the foundation of the mischief. * * This want of resource and recreation is not to be supplied by mere intellectual pursuits. There are many whose minds are not sufficiently cultivated to avail themselves of these: they have little or no taste for them, and yet are quite capable of being made very worthy, sensible, respectable, and happy men. Resources must be provided of sufficient variety to supply the different tastes and capacities we have to deal with."

These were Mr Greg's principles, as far as he had any besides the benevolence of his nature. We shall now see what he *did*. "For the first two years I was almost entirely occupied with the mill itself—building, making reservoirs, erecting an engine, putting in shafting and machinery, preparing gas-works, &c., and in collecting about us the requisite number of hands. In doing this, I endeavoured, as far as possible, to find such families as I knew to be respectable, or thought likely to be so, and who, I hoped, if they were made comfortable, would remain and settle upon the place, thus finding and making themselves a *home*, and losing by degrees that restless and *migratory* spirit which is one of the peculiar characteristics of the manufacturing population, and perhaps the greatest of all obstacles in the way of permanent improvement among them. Partly with this view, and partly for the sake of giving them innocent occupation for their leisure hours, we took three fields lying in front of the cottages, and between them and the mill, and broke them up for gardens, which we divided with neat hedges, and gave one to every house. Each garden is about six roods, and they are separated from each other by a neat thorn hedge. Besides these, most of them have a little flower-garden in front of their houses, or behind them; and the houses themselves have been made as comfortable as their size and situation would allow.

In the spring of 1834, the mill being then nearly completed, and a numerous population settled on the spot, I thought it time to establish a Sunday school for our children, as there was no school in the neighbourhood to which they could conveniently go, or which could afford accommodation to so large an increase of numbers as those our little colony could supply. I first mentioned my wish to a few of our elders, who I thought most likely to engage in such an undertaking. They received the proposal very gladly, and offered their services in the management of the school, if we could succeed in establishing it. We then called a general meeting of all the men in the mill, laid our plan before them; and as they all entered warmly into the scheme, and many proffered their services in the prosecution of it, we at once drew up our regulations, formed our committee, appointed some of the teachers, and opened the school, I believe, the next Sunday. We were for some weeks obliged to hold it in a *cellar*, for want of better accommodation; and we found many more children willing to attend than we had the means of providing room for. I was at this time, however, occupied in making a school-room near my own house, and when this was finished, the girls, who were the most numerous, took possession of the new building, and left the cellar for the use of the boys.* From that time the school has continued to flourish and increase in numbers. The girls' school now contains about one hundred and sixty children, and the boys' one hundred and twenty. Each school is under the management of a superintendant and a certain number of teachers, who give their services gratuitously, and relieve each other by dividing the work in such a manner, that each teacher is only obliged to attend every alternate or every third Sunday. They consist of men and young women entirely belonging to the mill. I take, myself, no active part in the management of the school, farther than spending an hour or two every Sunday in the room, and making such suggestions to the superintendant as I think necessary, which, if he approves of them, are at once adopted; or, if they involve any important change, are proposed at the next meeting of the teachers, which takes place every month; and which, in conjunction with the committee (a distinct body, however), transacts all the business relating to the school. The officers, such as the superintendant, treasurer, and secretary, are chosen annually by the body of the teachers, and the committee is appointed in the same manner. The superintendant of the girls' school, who is the head of the whole concern, and to whose zeal and exertions its success hitherto is mainly to be attributed, is himself, during working hours, one of our dressers, and labours in the ranks as humbly and diligently as the lowest of his fellows; but when the week's work is done, and Sunday morning rises to make the operative as free as his master, this worthy man assumes his long, black, clerical coat, puts on a broad beaver, grasps his walking-cane, and is at once metamorphosed into a methodist minister, a superintendant of the Sunday school, a spiritual friend and pastor among his neighbours, and the most important and honoured man in our whole community.

We celebrate the anniversary of the establishment of our school, by a general meeting and procession of all the children, on some Sunday in the month of June. They assemble in the morning with their teachers in my garden, and many of the parents come to share the pleasures of the scene. It is, indeed, a beautiful sight—at least to *our* eyes; and when they join together in singing a hymn, and the little silver voices of the younger children are heard mingling with the manly tones of their elders, and the deep bass of the accompanying instruments, we all pronounce our music to be excellent, and think no choir of a cathedral could be better.

As soon as the Sunday school was fairly established, and no longer required my immediate attention, I began to think of establishing games and gymnastic exercises among the people. With this view, I set apart a portion of a field near the mill, that had originally been designed for gardens, and taking advantage of a holiday and a fine afternoon, I called some of the boys together, and commenced operations. We began with quoits, trap and cricket balls, and leap-frog; and as I saw that many others soon joined us, and our playground continued to fill more and more every evening it was opened, I gradually introduced other games, and established a few regulations to preserve order, assigning a particular part of the playground for different games, and appointing certain individuals to distribute and preside over them. The girls and boys each took their own side of the field, and generally followed their games separately. The following summer, I erected a swing, and introduced the game called *Les Graces*, with bowls—a leaping-bar—a tight-rope, and afterwards a see-saw. Quoits are generally the favourite game of the men—the hoops and tight-rope among the boys—and the hoops and swing with the girls. The last is in perpetual requisition. With the hoops, the boys and girls now play a good deal together, and I encourage this companionship, as being extremely favourable to the cultivation of good manners, kind feelings, and perception of their proper place and relation towards each other. When we first began these games, this was a thing that had yet to be learned, and instances of rudeness and improper conduct did occasionally occur; but as I made a point of being always present on the ground, and gave our young ones to understand that I wished my leaving it to be the signal for the breaking up of the party, I had the opportunity of observing any breach of good manners or good temper, and gradually succeeded in breaking them into my system. We are now near the close of the third summer since the playground was opened; and during this season, I have not once had to remark upon any breach of order and decorum. Indeed, the system is now so well understood among us, that I no longer feel it necessary to be present during the games, though I generally am so, because I enjoy them as much as any of the party; and it is one of my chief opportunities of social intercourse with the people. The playground is open only on Saturday evening or holidays, during the summer.

In the autumn of the same year, 1834, we began our drawing and singing-classes. The drawing-class meets every Saturday evening during the winter, from six to half-past seven, and generally spend half the time in drawing, and the rest with geography or natural history. This class I teach myself; it consists of about twenty-five boys, and some of them have made considerable proficiency. They occupy themselves at home during the evenings of the week with copying drawings that I lend them for the purpose; and this affords an interest for their leisure hours, and an attraction to their home fireside, which it was one of my chief objects in introducing this pursuit to supply. During the summer, they continue the occupation or not, as they choose; but our regular lessons are given up, as our Saturday evenings are then spent more profitably in the playground, and we return to our winter occupations with much more zeal and relish, after a long vacation, than if they had been continued without interruption during the whole year. Some variety and change in our pursuits, I find as necessary to keep up my own interest and attention as theirs.

As soon as the drawing-class breaks up, at half-past seven, the singing-class assembles, and remains till nine. This class consists of girls and young men, to the number of twenty-eight. It is entirely under the management of the superintendent of the Sunday school, who meets them once a-week during the winter to teach them their different parts, and then brings them on Saturday evening to our large school-room, where they practise all together. We confine ourselves, for the present, to sacred music, singing in four parts, and, with the assistance of two instruments, make what we think very tolerable music. This class is very popular, especially with the girls, and it is considered a great privilege to be invited to join it.

One of the most successful of our plans, and the most effectual in civilising the manners of the people, has been that of having regular evening parties during the winter. The number at these parties is generally about thirty. They consist chiefly of the elder girls and boys, generally an equal number of each. They come by special invitation, a little printed card being sent to each, on which is written the day and hour when the party will take place. Much of the distinction shown to the guests depends on this *individual invitation*; and it is part of my plan to show as much respect as possible to those whom I invite to join our society. I do not invite all promiscuously; and among so many as we employ there are necessarily some who, on my system, have never been at a tea-party at all. I put those on my list whose manners and character mark them as in some degree superior to their fellows, or those who, I think, with a little notice and encouragement, and the advantage of good society, may gradually become civilised and polished; and I take care that no family that has any members of the proper age, who are tolerably respectable, shall be *entirely* left out, especially if they attend the Sunday school: so that, out of about three hundred people who are employed in the mill, and also live in our own colony (for many who work in the mill live at a distance from it, and these it is almost impossible to introduce into our circle), I think my list of eligible guests amounts to about one hundred and sixty. Of these, however, the superior ones—the aristocracy of the place—are invited more frequently than others, both because the presence of some of these is absolutely necessary to make the party go off well, and because I wish to show my sense of their merit by more than ordinary attention and respect.

These parties are held in the school-room, which I have fitted up handsomely, and furnished with pictures, busts, &c., and a pianoforte; and as it is close to my own house, the accommodations necessary for refreshments and amusements are easily supplied. Before the guests assemble, books, Saturday magazines, or drawings, are laid on the tables; and with these they amuse themselves till tea is brought in. The tea and coffee are then handed round to the company, and they continue to chat with me or with each other, and keep up a very tolerable amount of conversation till the meal is ended. I go about from one table to another, and always find several among the company who are not only able to ask a question and answer one, but to keep up conversation in a way that I think would surprise you. I never address myself to the whole company at once, and avoid, as much as possible, all unnecessary restraint or formality, endeavouring, as far as the case admits, to carry on the party as if it were held in my drawing-room, and consisted of my own friends and equals in society. After tea, we fall to our games, which consist of piecing maps or pictures, spilicans, chess, draughts, building houses of cards, phantasmagoria, and several others of less note; while those who do not play amuse themselves with reading, or discussing the news of the week or politics of the colony. Sometimes we have a little music and singing; and towards the end of the evening, we rouse ourselves with Christmas games, such as, tiercely, my lady's toilet, blind man's buff, &c. &c.; and soon after nine, I bid them good night, and they disperse.

I should have told you that there is a little anteroom attached to the school-room, where the guests deposit their hats, bonnets, &c., and where there is a good fire; so that, after their evening walk, they come into the room dry and comfortable, and are generally dressed with a neatness and propriety, and even good taste, that do them great credit. The boys and girls sit at different tables during tea; but in the course of the evening, the ranks are generally broken, and many of them join each other in their different games. The parties I have just described consist of the elder girls and boys of our colony. Occasionally, however, we have a junior party. These are generally the most pleasant ones, as the little restraint that is somewhat requisite among the elders is here voted unnecessary and out of place, and there is much more laughing, fun, and merriment among us. These parties take place about once in three weeks during the winter, on Saturday evening; the drawing and singing class being given up for that day.

In the autumn of last year, I established some warm baths in our colony, which have been brought into very general use, and have contributed materially to the health, comfort, and cleanliness of the people. The bathing-room is a small building close behind the mill, about twenty-five feet by fifteen. The baths, to the number of seven, are ranged along the walls, and a screen about six feet high, with benches on each side of it, is fixed down the middle of the room. The cold water is supplied from a cistern above the engine-house, and the hot water from a large tub, which receives the waste steam from the dressing-room, and is kept constantly almost at boiling temperature. A pipe from each of these cisterns opens into every bath; so that they are ready for instant use. The men and women bathe on alternate days, and a bath-keeper for each attends for an hour and a half in the evening. This person has the entire care of the room, and is an-

* We have now, however, built a very good school-room for the boys.

swerable for every thing that goes on in it. When any one wishes to bathe, he comes to the counting-house for a ticket, for which he pays a penny, and without which he cannot be admitted to the bathing-room. Some families, however, subscribe a shilling a-month, which entitles them to five baths weekly; and these hold a *general* subscriber's ticket, which always gives them admittance to the room. I think the number of baths taken weekly varies from about twenty-five to seventy or eighty. During the first four months (from November to February inclusive), the average was about seventy-five weekly. I pay the bath-keepers two shillings and sixpence, and two shillings a-week; and I believe this amount has been more than covered by the receipts. The first cost of erecting the baths was about eighty pounds.

The above plans, with our library, day-school, band, and flower-shows, are all that we have yet [1835] set on foot in our colony, as the time which has elapsed since we commenced is short; and I do not think it is desirable, even if our progress were more easy, to go on too fast with such schemes of improvement as those I have attempted. Many of them were at first mere experiments, and I was obliged to feel my way cautiously, that I might not throw my labour away, or run the risk of doing harm instead of good by what I undertook. But the more I *have* done, the more I see *may* be done, and *ought* to be done; and as I have better understood the characters of those I have had to work upon, and succeeded in developing their capabilities, the more have I been convinced how much both may yet be elevated and improved."

MRS CALDERWOOD'S TRIP TO THE CONTINENT.

The Maitland Club—an association for privately printing curious manuscripts of former times—has recently given birth to a quarto entitled "The Coltness Papers," consisting of various memorials of the Steuarts of Coltness, a respectable family in Lanarkshire, recently terminated in the main line. The bulk of the volume is occupied by a narrative of a tour from Scotland to the Low Countries in 1756, by Mrs Calderwood of Polton, a sister of the Sir James Steuart who was one of the earliest British writers on political economy. A remarkable flow of intellectual vitality has characterised this family from its progenitor, Sir James Steuart, Provost of Edinburgh in 1648-50, down to the present times, and Mrs Calderwood seems to have had her full share of the inheritance. "To read English ill and plain work" were then the sum of a Scottish gentlewoman's education; spelling had not taken its place amongst the virtues; and any one who was acquainted with Pope, Swift, and Addison, was most likely to show her wisdom by saying nothing on the subject. But the less education that existed, natural talent seems to have had just the greater chance of ripening into a certain piquancy, such as the disciplined intellect perhaps rarely exemplifies. We see this strongly in Mrs Calderwood, whose narrative, though written only to amuse a daughter left at home, is full of pointed racy remark, keen sense, and a very considerable amount of humour, of the character of that of Smollett. We are the more disposed to introduce it to the notice of our readers, that it is a curious and instructive record of contemporary characters and circumstances.

Mrs Calderwood travelled with her husband, who seems to have been an indolent good-natured man, one or two young people, and a servant, John Rattray, whose remarks, in broad Scotch, she is fond of commemorating. The reader will probably be surprised at her commenting on political matters, questions as to agricultural improvement, and so forth; but we find that she took sole charge, at home, of both the family estate and its political influence, and was successful in both departments. It was on the third day that the party reached Durham, where Mrs Calderwood was surprised, as it was Sunday, to find boys playing at the ball in the piazzas of the cathedral. She asked a girl if it was customary for the boys to play at ball on Sunday; to which it was answered—"They play on other days as well as Sunday." The girl's mother, again, who showed the cathedral, seemed to think Mrs Calderwood an outlandish heathen for not understanding the use of the hassocks placed in the seats. In those days travelling was travelling, not locomotion; we must not therefore be surprised that, betwixt Doncaster and Bantry, a highwayman approached their carriage, and was only beaten off by a stratagem of John Rattray. Mrs Calderwood seems to have everywhere asked questions; but she was vexed to find that few people knew any thing beyond their own immediate concerns—a remark which the Scotch are still apt to make respecting the English. "In our first day's journey in England, I asked the post-boy to whom the lands on each hand belonged? He said—'To Sir Carnaby.' I knew who he meant; and to try him, asked, 'what Sir Carnaby, or what other name he had?' but he answered—'Just Sir Carnaby, who lived yonder,' and that he had never inquired the surname of the man on whose ground he was born." The journey from Edinburgh to London seems to have required six days. Mrs Calderwood makes this general remark on the surface of England:—"It is easy to be seen who has been long in peaceable possession and who not; for, till you come to Newark upon Trent, the farthest ever the Scots went into England, the improvements are not of old standing, nor the grounds don't seem to be of great value; they use them mostly for the breeding of cattle and sheep." Another of her observations savours strongly of the Scottish Presbyterian:—"I think the Cathedral of Durham is the most ridiculous piece of expense I saw, *to keep up such a pageantry of idle fellows in a country place*, where there is nobody either to see or join with them, for there is not place for above fifty folks besides the performers." With the following, which is called forth by a reference to the large, many-horsed waggons used in England, there will probably be less dispute:—"It is surprising how much nonsense I have heard spoken by folks who would introduce English customs into Scotland, without considering the difference of the two countries. I must own I saw very little new to me but what I could plainly see was calculated for the particular situation of the country, and could never answer for general use. It has always been my opinion, that *the fault-finders are the folks who want judgment*, and not the people whose practice they quarrel; for time and experience have taught every part of every country to follow the method most agreeable to its soil and situation." Mrs Calderwood incidentally mentions that the wages of a labourer in a rural district—and she seems to hold the case as a general one—were a shilling a-day, which she considered high.*

In London, she thought meanly of the brick houses, admired the vast number of fine horses, and found the noise of vehicles intolerable. A fortnight elapsed without her having seen any of the royal family; and for this she gives as a reason—"I found, as I approached the court and the grandees, they sunk so miserably in my opinion, and came so far short of the ideas I had conceived, that I was loath to lose the grand ideas I had of kings, princes, ministers of state, senators, &c., which I suppose I had gathered from romance in my youth. We used to laugh at the English for being so soon afraid when there was any danger in state affairs, but now I do excuse them. For we at a distance think the wisdom of our governors will prevent all these things; but *those who know and see our ministers every day see there is no wisdom in them*, and that they are a parcel of old, ignorant, senseless bodies, who mind nothing but eating and drinking, rolling about in Hyde Park, and know no more of the country, nor of the situation of it, nor of the numbers, strength, and circumstances of it, than if they had never been in it. Lord Anson, he sailed round the world; therefore he must rule all naval affairs: which is just like a schoolmaster imagining himself qualified for the greatest post in the law, because he understands the language in which the law is wrote. * * The king, every body says, and I do believe it, knows more of the world, and takes more concern, than any of them. It is reported he cried when he read Byng's account of his actions, and said, 'Who can I trust?—or upon whom can I depend?'" At Kensington, "I could not see the private apartments of the *old goodman* [the king], which they say is a great curiosity. There is a small bed with red curtains, two satin quilts, and no blanket, a hair mattress; a plain wicker basket stands on a table, with a silk night-gown and night-cap in it; a candle with an extinguisher; some billets of wood on each side of the fire. He goes to bed alone, rises, lights his fire, and mends it himself; and nobody knows when he rises, which is very early [George II. was then seventy-three], and is up several hours before he calls any body. He dines in a small room adjoining, in which there are very common things. He sometimes, they say, sups with his daughters and their company, and is very merry, and sings French songs, but at present he is in very low spirits. Now, this appearance of the king's manner of living would not diminish my idea of a king: it rather looks as if he applied to business."

On the way to embark at Harwich, Mrs Calderwood seems to have gone deep into the statistics of Essex calf-feeding. Her description of the packet, with its two bed-surrounded cabins, full of miscellaneous company, all of whom got sea-sick, is a droll though coarse picture. "Marinasa, the opera-dancer, was in the company, and a companion of his, a Swiss, who was either a singer or a dancer, we could not know which, *for he sung very ill, and did not look as if he could dance.*" On the company being landed at Helvoetsluys in a Dutch boat, the charge of a shilling of fare raised a stormy quarrel, which, as the parties understood nothing of each other's language, became a good representation of the confusion of Babel. Mrs Calderwood could make out nothing but a certain phrase of execration, "which, to the honour of the English, has become a part, and I think the only part, of the universal language so much wished for." She and her friends proceeded in a waggon to Rotterdam, where they lodged at the *Swyn's Hooft*, "which, being interpreted, signifies the swine's head. This house was kept by a Frenchman and a Dutch frowe of the first magnitude." Then we have a vast number of particulars about Dutch streets, canals, houses, and so forth, none of which would be new to our readers—except, perhaps, one, which certainly is eminently absurd: "If any street runs a-squint the town, then all the houses run a-squint in the fore wall, and every room is two feet longer on one side than the other." She remarks, that the Dutch do not use their own fine Delft ware, but "ugly pewter," nor the ladies the fine chintzes of the country, but English cottons; and adds—"Providence has certainly wisely ordered, for the greater correspondence amongst mankind, that every country should despise its own produce or manufactures." We have been rather surprised to find Mrs Calderwood describing, as a thing new to her, the custom of having a hole through the wall beside the outer door for a bell-pull.

Our tourist thought the Dutch solid and rational, and more ready of understanding than the English. She was struck by their behaviour on Sunday. "They almost all wear black to go to church, and you would take them for so many Seceders, they put on such a Sunday face, and walk as if they could not look up. No sooner is sermon over but they fall to feasting, drinking, and dancing." Their toleration astonished her, and she could not understand how the men in authority should not endeavour to suppress Popery. Magistrates would even order orphan children to be brought up in that profession, if it had been so appointed in the marriage-contracts of their parents. Travelling in the waggon from the Hague to Amsterdam—in which conveyance they found several men of consequence—they met a youth who had been in England. "He said he could not understand the pleasure the English took in horse-races and cock-fighting, such cruel diversions, but said, what things folks were accustomed to, they did not reflect upon the cruelty of them; for, when he was in England, a gentleman whose house he was at desired him to show him the way of dressing a water-sutchy. 'I took,' said he, 'the perches alive, and scraped them with a knife, for otherwise the scales do not come off.' 'Oh!' cried the Englishman, 'there never was such a cruelty, to scrape the fish alive!' 'Are you not as cruel,' said I, 'who can take such pleasure in tormenting a poor cock for your diversion?' 'Truly,' says the Englishman, 'I never thought of that before.' 'Nor,' said I, 'of the pain it gives the perches.'"

"Every thing is dear in Holland," says Mrs Calderwood, "but East India goods and charity. A beggar is well satisfied with a doit, which is the fourth part of a halfpenny, and I believe *our beggars judged ill in destroying the doits*, for every body gives, and doits come to a great deal. There are two of the corners at Rotterdam where the ramparts are not joined by bridges, and there is a boat by which you are ferried over for a doit, and these two doit-boats bring into the town's treasury near a hundred pounds sterling per annum each." This is a good illustration of what the present age has recognised as the *cheap* principle.

Mrs Calderwood discourses largely on the ceremonies of the Catholic places of worship, and the monastic establishments of the Low Countries. At Liege, she went with her friends to the Scots Jesuits' College, where she found several descendants of those who had exiled themselves with James II. One Maxwell, from Dumfriesshire, was a fine tall venerable figure; but another of the inmates was of a different character. This was Daniel Mackenzie, a native of Inverness, who had been a smuggler, or, as she insists on interpreting it, a pedlar, in his own country, and was a proselyte. "As for my friend Father Daniel," says the satiric lady of Polton, "he is a good-natured, innocent, obliging soul, very ugly and very merry. He is just a Scots pedantic scholar, and was always snuffing, out of curiosity, about every sort of religion to see what it was, and what this folks' set of tenets were, and upon what they had founded their differences from others upon. Had he been bred a divine, he would at this time have been a member of the presbytery of Dunfermline, or perhaps Mr Jamieson's pastor at Kennoway; but as he was bred a smuggling merchant, or perhaps a packman, he walked twenty miles to hear Mr Whitfield, Mr Ebenezer Erskine, &c.; and after satisfying his curiosity about them, he fell to trying what sort of cheese the Catholics set their traps with; and, as he was snuffling about that, I suppose he found that a life of study and idleness could be had without an estate, or so much as a farthing, none of which the others had offered him. His being a proselyte gained him an easy admittance, and there he lives at his ease, and labours at logic and what not to his heart's content. I do believe, poor creature, he has not a wish beyond finishing his studies and becoming a professor; he has three years of study yet to come. The students are kept very strictly to hours and rules, and are held at an awful distance from the old fathers. Daniel asked leave to attend us, and obtained it, to his great joy; he looked always, when he came, like a dog *wagging his tail for gladness to get out.*"

At Spa—to reach which, in order to visit her exiled brother, the jacobite Sir James Steuart, was the object of Mrs Calderwood's journeying—they lived in a lodging with a number of Scotch friends, where the landlady cooked for them. "We often got good sport with John's French, and the mistakes that happened betwixt him and her. They wanted to have a haggis;* but John said, we must set our hearts bye that, for he had seen nothing like meal in that town. That day Mr Calderwood had bid the landlady get him some honey; so, when she was counting with John at night, there was an article for *miel*. 'Meal!' says John—

* A passage in Allan Ramsay shows that labourers were then to be had in Edinburgh for exactly half the sum.

* For those who have the misfortune not to know what a haggis is, let it be stated, that it is a pudding of oatmeal, mixed with spice, minced suet, and meat, and boiled in one of those articles from which puddings originally took their name.

'deil a grain have I seen in your country; no, no, madam—no, no,' and shook his head. Upon this, she came to Mr Calderwood, who put John right, and told the woman what he had mistaken it for; upon which she produced meal, to the great joy of the company, who, by this mistake, got a haggis. I asked John one day how they called the maid of the house? 'I don't know,' says he, 'how they call the women servants here, but they call us men *dumbsticks*.' 'Troth,' says I, 'you're really well named *at present*.'"

The party afterwards spent a considerable time in Brussels; and it would appear from Mrs Calderwood's journal, that in that city, Spa, and some others which she describes, the English were almost as rife in 1756 as they are in these days. Some of her sketches of men and things are very curious. She speaks of the distributions of food at the monasteries, as making many of the poorer classes depend upon charity instead of work; while the practice of mendicancy by the religious orders themselves rendered begging so respectable, that it was extensively resorted to. "You would be surprised to see such well-drest beggars. I believe the commons send out all their children a-begging. There are many very able to work has no other employment; you will see them standing at a door, and touting a *Paternoster* through the key-hole. I was coming up a street one day, when a very decent, well-drest man took off his hat, made me a bow, and said something softly; I imagined he had some prohibited goods to sell, and made him a curtsey, and asked him what he said, and he asked charity for two children he had: I thought as much shame as if it had been me that was begging; but having learned the way of the place, I gave him a farthing, for which he was very thankful. I very often surprised a poor old body whom I see working a stocking, or doing anything of work kind, by giving them a placket, which is threepence halfpenny, at which they clap down on their knees, and pray in Latin till you are out of hearing. The Latin prayers have cost me several pence, for the bairns are so fond of making them pray, that all the copper money was lawful prize whenever they got their hands over it, so that they never set out without half a dozen at their tail. I asked somebody who knew, why there were folks in such good dress begging? They said it was the fashion over all this country for people to travel for nothing, and any body who could afford to go in a carriage, if they had business from one country to another, never thought of money to bear their charges, but begged every thing they got; and the folks on the road had learned to think themselves obliged to feed and lodge them for nothing, *just as the lasses of Moffat think themselves obliged to carry the men over the waters*."

Amongst the English at Brussels, they met one whose mode of life is worth relating. He was a Mr Hope, a near relation of Lord Holland, and had enjoyed a patrimony of L.1500 a-year, which he ran through in his youth, all but a wreck, affording him an annuity of between thirty and forty pounds. "He came abroad, travelled about from place to place till he had forgot his misfortunes, and some years ago he settled here. He has a room which he furnished for himself, and this room is his whole house. He maintains himself in every thing without boarding, dresses his own meat, buys every thing for himself, and requires no assistance from any body. In the forenoon, he puts on his frock and goes to market, and is Mr Hope's man; in the afternoon, he is very genteelly drest, with a sword (which nobody can stir over the door without here), and is Mr Hope himself. His acquaintances say, that sometimes they see him pretty often, and sometimes not once in six months; that, I suppose, is just as he is in the humour, for he lives entirely to his own taste, and subjects himself to nothing that is not agreeable to him. It seems he was in a visiting humour when Sir James [Steuart] was here last winter, for he came to him often, and I got a letter to him from Sir James, but it was several weeks before I could find him. At last I got a letter conveyed to his hand, and have had one or two short visits of him; he is one you must not press or invite, because he says he has a great deal to do, and cannot give up his time to others. His house is at one end of the town, and he has a garden at the other, to which he goes several times a-day, and works it himself, and is, they say, very curious in this particular. He keeps the hours of this country, and dines at twelve o'clock. However, as I suppose he took a fondness for Sir James, he dined with him often; but then, he must show he was so much on a footing that he must dine again with him, so invited him and several others to a very genteel dinner, which he had dressed himself; notwithstanding which, there was he, drest out, and the dinner upon the table, ready to receive them at the time appointed."

We must now part with Lady Polton, as the complaisance of her own country would call her; but, before doing so, we may present a general conclusion at which she arrives on the subject of travelling and foreign manners. "The proper use of it [travelling] is to learn to set a just value upon every country, and the things they possess; and I believe, when accompts are balanced, the favours of Providence are more equally distributed than we rashly imagine; what one country wants another can supply, which links men into one common society; and it is curious to observe the contrivances they fall upon to supply those wants [which] either cannot be purchased, or are too expensive for the generality. The people on the continent have their minds more at large with regard to the rest of the world than those in an island; they have opportunity of converse with all nations, which takes off prejudice, except when it is political, and even then it does not extend to individuals. Their behaviour is politer, because they are often among strangers, and it makes just the same difference betwixt them and us, as it does on the same man when he is in company and at home; he is the same man in head and heart when he is entertaining a great visiter, as he is when lolling at his own fireside."

THE LOBSTER-POTS.

THERE wasn't a widow in the parish of Kilkettle to come near the Widow Wade. She had a handsome cabin, a good slip of a garden at a low rent, a cow and a calf, a sweet pig-stye, and a sweet face; to say nothing of a sweet temper, now that her husband, poor Thady Wade, was dead. She had, I had almost forgotten to mention, a stout yawl, and made a handsome thing of the lobsters she took out at Skerry Island, and sold to Green, in William Street, Dublin. It would have been a pity to forget this, since on these lobsters my story as much depends as did her income and her happiness. She had, indeed, a sort of monopoly of the Skerry Isle lobsters; and whether it was the respect borne to the memory of her deceased husband, as connected with lobsters, or the approbation of the village and neighbourhood of the perseverance with which she—though, from her sex and habits, herself precluded from taking a principal part in the capture of these *recherché* animals—pursued them, through the instrumentality of her well-paid crew, I know not; but certain it is that two rival yawls, which had been well-tarred and set on the same ground in the same line, had become successively bankrupt; and it was but seldom that a fisherman was driven to such desperation, by bad success elsewhere, as to poach upon the widow's manor of Skerry Island. There might have been other causes for this, perhaps; she retained none in her service but the stoutest and ablest-bodied of the "boys" about "the ground," as this spot of ocean was termed. This circumstance also favoured her neighbours' honesty—it was retired, and far from the observation and interference of meddling witnesses; and an occasional sound drubbing to the whole of the crew of a rival boat was an offence which, committed on the high seas, was beyond the legal grasp of the village attorney, and had to be proved by bystanders. Whether such means were ever resorted to, I have no way of knowing, nor indeed any right to inquire. Of this fact I am positive, however, that Widow Wade was exceedingly excitable on the subject of her lobster-pots; and her temper, angelic as it is stated to have been, is known to have given way at the bare mention of a good take of lobsters on the coast of Skerry Island by any other yawl than the "Jolly Boy" of Kilkettle.

But although I have stated that lobsters formed an equal part of her income and happiness, it remains for this story to prove that the setting up of any idol in the heart brings its own punishment, in that idol itself being made the source of misery to its adorer.

One fine evening three "boys" sat on the top of a low wall built of loose stones cemented with sea-sand, between the suburbs of Kilkettle and the sea, with their faces turned towards the latter, having the rock called the Skerry Island opposite, and consequently—but this must be evident. Their names were Pat Nelligan, Jerry Green, and Billy Slattery; and their business seemed to be that of pulling down the aforesaid wall, since, according as they talked, they kept loosening the stones, and rolling them into the field at their feet. Whether they were hired for this express purpose or not, I cannot say; they seemed to take it very easily, and the occupation appeared quite subordinate to their conversation, which referred to the vested rights of the Widow Wade, and which they could not by any process of reasoning see the rights of. That night, to cut a long story short, they were to shove out the mackarel yawl after dark, and make for the "ground" off Skerry Island, and the take was to be sent up by Billy Slattery's potato-cart, which was to quit Kilkettle before dawn the next morning for Dublin, with a load; the profits to be fairly divided between the parties, share and share alike.

The compound word, "lobster-pot," not explaining itself, and some of my expected readers probably living where they never heard its parts connected, except when the kitchen fire was considered an inseparable adjunct, I think it needful to explain, so far as to say that it is *not* the vessel in which the fish is to be boiled that is let down into the sea to catch him; on the contrary, the "pot" preliminary—pot the first, as it may be termed—is a sort of trap made of stout osier twigs, of the shape and construction nearly of certain cage rat-traps, and, the bait being placed within, the animal is induced to squeeze his body through some re-entering rods, which, having bent a little to facilitate his entry, present their points, with cruel indifference, to the gentleman, who, having regaled himself, expects, in common justice, to be allowed to go about his business again. The machines which act so unhandsomely towards their prey, and so cleverly for their employers, are sunk with weights to the bottom of the sea, where it is of a moderate depth, and rock and sea-weed present a likelihood of the presence of the fish—a stout line being attached to the "jetsam" (as lawyers might term it), thus converting it into "flotsam," by means of a range of corks placed along it near its other extremity, at equal distances, and which are as well the guides to the locality of the pot and expected lobsters beneath, as the means of both being hauled conveniently to the surface of the water—or, as the widow and her myrmidons would have more curtly expressed it—*riz*.

Well, then, about eleven o'clock of the night following the evening in question, a clumsy but strong-built yawl came dodging up upon the undulating surface of the sea, into a lonely and wild creek upon the north shore of the rock called Skerry Island. The cliffs of black and weather-beaten limestone rose perpendicularly out of the water to the height of between one and two hundred feet, and, in the darkness of the night, were defined no farther than by the numerous nests of sea-fowl, which, with their white inmates and white deposit, shaped out in some degree the fissures and projections of the mass. The echo caused by its vast reverberating surface in the little bay seemed asleep now, only repeating, as if in a dream, the plash of the little yawl between the seas, the stroke of her oars, and the occasional chick of a gull or gannet, as, snug in a cleft, it hinted to its companion to lie over a little. There was a snore, too, as if dame Echo drew long breaths with her mouth shut; but this must have been nothing more than the tide beginning to flow through the North Sound.

The boys knew the "ground" well, evidently, for they pulled as straight for the lines as if there was a flag-staff to mark them.

"Now, Jerry, hould way on her," said Pat Nelligan in a low voice, for the echo alarmed him; "hould way till I get a grip ov the line. The tide 'll dhrop us away." So saying, he went forward in the boat till he reached her bows, when he leaned forward and over the gunwale, so as to seize the line attached to the corks near its extremity.

"Hould it! hould it!" cried both the oarsmen, who now saw that he had grasped it—"hould it till we ship the oars, and riz it all together!"

"I've missed it!—shlipped out betune my fingers!—make a grab at it, Billy!—you'll have it to larboard!"

And accordingly the cork, after ducking beneath the keel of the boat, emerged to the surface just under the towel-pin of Billy's oar. To seize it, and jerk it into the boat, was the work of a moment; and all three laying hold of the wet and splashing line, drew up the "pot" safely to her side. Here the precious article was set upon with a curiosity worthy of antiquaries over a mummy-case, and examined as to its contents. They were average—a few tolerable fish, and a number of worthless fry; the latter were restored to their element, making good the remark, that insignificance is safe when eminence suffers; but the former were carefully bestowed in the bottom of the boat, after which they pulled a few strokes to the next line.

How frequently do our most pleasant exploits furnish a lash to scourge us! Little did Pat Nelligan know what a whip he was preparing for his own precious back when he was hauling up the pots of the Widow Wade. Was not that honourable lady at that very moment dreaming of Pat? Yes. The fact was undeniable. There *was* a leaning that way. But the Widow Wade had pride—high and inflexible pride; and she never had told her love. If she had even given a hint, Nelligan had as soon have eaten his own fingers down to the first joint as have launched the mackarel yawl that night; he could have "riz" the lobsters another way.

The pots were found empty the next morning by the *bona fide* resurrection-men of the deep, for the lobster-snatchers had forgotten to take bait to put down with the pots again; and it far exceeds the scope of my humble capacity to describe the state of the widowed proprietor's mind at the discovery. To say that she swore would perhaps be, in its worst sense, too much; but as near as she could shave to the third commandment she did, certainly; and her general language, I am afraid, was sadly deficient in the grace of Christian charity for some hours that morning. She hurried down the long and straggling street of Kilkettle in the direction of the harbour, discharging upon every neighbour she met a portion of that vituperation which, like vapour receiving constant accessions from the fire of wrath within her, every instant threatened to burst the machine that confined it. So we have remarked the engineer, with malicious ingenuity, contrive to time the sharp and deafening discharges of his superfluous steam exactly when passenger after passenger is closest to the nostrils of the panting monster.

"They've been at the pots: listen to that, Molly Magrath; they've been at the pots; say! Wait till the lone widdy gets down to the quay, and see what the boys 'll say."

"Whisht, Mrs Wade," the person addressed might venture to reply, respectfully endeavouring to soothe the exasperated dame; "maybe it was a bad night for the fish, and"——

"Bad for the fish! dad, it'll be bad for the flesh of them that's robbed me, if I come across them! And the likes of you, too, that maybe knows all about it, with your 'maybes!'"

"There, Gusty Connor; they've done it at last! Not a prawn in the pots! I wondher they ever left me one—the poor lone widdy that I am! Well, aisy, till I find them; and if my name's Wade, found they'll be, and in Kilmancha, afore the week's over! I'd like to get my hand on them first; I'd comb their heads with a three-legged stool—so I would!"

These successive disclosures of the state of her mind to the various friends who lived in that part of the street

between her own house and the harbour, did not tend (as may be guessed) to allay the excitement under which she laboured, and by the time she had reached the seaside, she had put on the full power of language. Now, it happened that just as the animated engine came smoking round the corner of the harbour-master's house, what should it come full against but the personage who has figured already so prominently in our narrative, and in the lady's dream---Pat Nelligan! She stopped short, and looking in his face for an instant, without uttering a word, at last dashed her arms into the air over her head, her hands quivering till the fingers became invisible, and then, seizing the astonished Pat's collar in both hands, she wrung his neck, and shook him to and fro as an earthquake might be supposed to shake Patrick's church, while her heart, with the single intelligible words of—"Oh, Pat!" gave way within her, like an Artesian well when the last blow is inflicted upon the rock, and gushed to the surface in a flood of tears.

What were Pat's sensations at that harrowing moment? That he was detected, known, betrayed, exposed, ruined, he of course took for granted. With one furious thought, which included in its scope the whole race of lobsters and proprietors of pots generally, he set himself to think what he had to say why he should not be forthwith committed to his majesty's jail of Kilmancha. He was, however, saved the trouble of moving in arrest of judgment.

"Pat Nelligan, if you had been there, I mightn't have been ruined this morning."

Here was a most unforeseen disclosure of affairs. Nelligan discovered that, so far from being suspected as the author of the theft, he was clung to as the injured fair one's most confidential protector; and, moreover, he fancied he could trace a certain coquetry in her rage, a sort of stormy *badinage*, which seemed to encourage him to comfort and avenge her, under the hopes of being sweetly successful.

Pat was a man; he was, moreover, an Irishman. It was therefore becoming, natural, and expedient, that he should take advantage of such a state of matters. He did so; and, to make a slight break in this eventful history, a few days had completely altered his position in life. He hoped—for he was given reason to hope—that the widow, the house, the garden, the pigs, and the pots, would all be his own, and that soon, provided—and here was the gall which the whip of his conscience touched with killing smartness—he could silence Bill Slattery and Jerry Green; but so far from doing so, he found that he must still share and share alike in their insidious adventures. This was horribly embarrassing.

"What's the matter wid ye, at all, that ye can't spake like another man?" said the pair one day to Pat. "Here's your share of the lobsther-money, seven and three-ha'pence; and the next time we'll take bait along wid us."

Pat Nelligan felt his heart give a small rise and then a great go down. "The next time?" he faintly ejaculated.

"Ay, Pat Nelligan, the next time," said Billy; "that's to-night—do ye mind? At one o'clock the yawl 'll be behind the keel rock, and we 'll be waitin' for you."

"Oh, Billy! oh, boys!—you wouldn't be afther"——

"By the mass, we would be afther the lobsthers as soon as we dare; sure, arn't we safe wid you that knows when the rale yawl 'll be haulin'. You must ordher her out iv the way that time, any how."

To detail the expostulations of the wretched Pat, the thumbing of his stick, and the sweating of his brow, would be impossible. Suffice it to say, that the intended spouse of the Widow Wade, the expectant proprietor of all the pots of Skerry Island, now found himself in the situation of one who is committing suicide of his best hopes, and robbing Pat to pay Billy and Co. The melancholy crime was perpetrated; with the indifference of despair, Pat went through the irksome duty; and, as is usually the case where there is indifference as to the result, his efforts were crowned with success; they had a splendid take, and put bait down again. The widow's "boys" had but a poor haul next day, and she was out of spirits accordingly—suffering herself, however, to be comforted by the caresses of the self-upbraiding but too charming Patrick Nelligan.

The thing was now too tempting a speculation not to be carried on vigorously by the parties embarked in it; I mean Slattery and Green, for Nelligan represented the patent discovery in the business, which was used without scruple and at convenience, and the monopoly of which proved the source of profit and success to the shareholders. He was now personating a double character: his life was passed in two distinct hemispheres; in the one he was the roaring, rollicking boy, the envy of the males and the admiration of the females; in the other he was the midnight thief, stealing from the haunts of men in the company of scoundrels, and, for a paltry chance of gain, subjecting himself to the momentary chance of detection and disgrace; thus resembling the heavenly twins, one part of this Hibernian constellation being above board, and conspicuous in the firmament of Kilkettle, the other plunged as many fathoms below innocence and safety as the fish for which he sinned crawled beneath the surface of the ocean.

But what most sorely puzzled our friend, the widow, in the whole business was, how it happened that, though she and her trusty "boys" were fully aware of the constant depredations committed upon her property, not all their vigilance could detect the offenders. Every stratagem was tried, and tried in vain. A viewless unseizable arm seemed to be put boldly down night after night into the water, and empty, as if by magic, the widow's pots, leaving not a shrimp behind.

As my story draws on, it will be observed by the judicious reader how beautifully and naturally the moral works itself out; twining imperceptibly yet substantially with the web I weave, like the "rogue's yarn" in the dock-yard cables. This was the point in the Widow Wade's character which wanted to be taken hold of by the rough hand of fate, and made the means of teaching her a lesson. The woman was unobjectionable in other respects, but in the matter of lobsters she failed. They were her idol.

Pat had a queer and unsatisfactory part to act. He was placed, by the confiding love of Mrs Wade, as a watch upon the thieves, and thus given the duty of looking after himself—disagreeable at all times, but doubly so in the present instance, in which fidelity to his employer must necessarily imply injustice to his own interests. His work, too, was hard—double tides, it might truly be called. He had scarcely stepped out of the old mackarel boat, when he was into the new lobster yawl, and off to the bay again, where he was sure to find a poor take, and have to report accordingly.

The wedding-day was fixed for the morrow. The mystery of the lobster-pots excepted, there was sunshine in the Widow Wade's breast. She had got every thing ready—a new gown, a clean table-cloth, and a gallon of spirits; and hoped that the nuptials, by its ring, its punch, or some other way, might break the charm. As she sat ruminating late that evening, it occurred to her that perhaps the zeal of Pat Nelligan might induce him to be a watcher that night too; and as she had observed the effects of his vigilance apparent on his brow and bones lately, clouding the one and reducing the covering of the other visibly, she thought it time that he should have some comfortable rest: and so strongly did this wish affect her, that she at last determined to intimate her wishes to their object; but how to do this was the question. Mrs Wade, though a widow, had a maidenly bashfulness with regard to her approaching nuptials; and she could not muster courage to consign the fond message to those about her. To bear it herself, then, was the only alternative; and as Pat's cabin was not far off, and the night fine, she could, as she expressed it, "shlip out unknownst;" and having only just intimated her wish (for she had high notions of propriety), return to what repose her present position might permit her to enjoy.

But as the dusky gentleman generally contrives to play those who have dealings with him a scurvy trick at last, it so happened, that on the identical night in question, Patrick Nelligan thought that he would indulge in one grand piece of criminality—the summing up, as it were, of all his sins against the peace of her who was to be his sovereign lady on the morrow; and actually, himself and his companions in iniquity, regale themselves with a feast, composed of the very materials of their plunder—or, in plain words, have a *lobster-supper*. At eleven o'clock that night the three companions might be seen seated round Pat's deal table, with the contents of the "pots"—now turned from black to red, as if blushing at the crime of their devourers—in profusion before them, flanked on one side by a monstrous dish of potatoes, and on the other—for Father Mathew had not then been heard of—by an equally gigantic vessel of spirits, the kettle being on the fire, and a well at the back of the premises.

"Pat, honey," said Slattery, shoving the bottle over, "you're low this night; mix a dhrop, it 'll riz your sowl."

"Ay, Pat," added Green, sending on the liquor another stage, "fish is dhry aiting."

"And whishky's hungry dhrink," continued Billy, seizing on the body of a monstrous lobster, and, like Dirk Hatteraik, breaking it's back; "long life to Mrs Nelligan that is to be, and success to her thrade."

"Amin, this night," responded Pat, with a long and sorrowful face; "an' a mortial take iv fish to uz all this saison. There's as good in the say as ever was caught."

"And room for us all at the bottom, Pat Nelligan," added Green, looking over to Slattery; "that's the bargain—isn't it, Pat?"

"Oh, by coorse, when I get the widdy to hear raison. Why shouldn't honest boys fish at Skerry Island as well as herself or her man? But give uz time, boys; them cattle's not come over in a minnit; and the widdy's mighty strong in her mind, till she's made sinsible, boys, ye know. Faith, I heard something like a voice!"

"A voice? maybe it's the widdy herself," cried Billy, with a derisive laugh, "come to look afther her lobsters. By the mass, iv it is, we'll ax her in, to crack a claw wid uz."

"Well, Billy," said Pat, "iv it wasn't that we're here by ourselves, I'd take my oat' there was somebody prisint. May the ears fly off iv me, if they didn't hear a low screech not half a perch off."

"An' the place full iv the varmin," replied Billy, again laughing contemptuously; "what 'id the rats do but run screechin' about, an' they to have such pickin's by'nbye? Aisy, aisy, honey; ye're timmersome this night. Mix another tumbler—the kittle's bilin'—and tell uz what it was the widdy done to ye that mornin' at the harbour, that coaxed ye on. Ye used to be the bashful, retirin' boy, an' it 'id take a brave man to put the first word to her."

"Och, ho, ho!" cried Pat, trying to laugh, and scratching his head; "it was a quare turn, an' I never rightly undherstood it. Up she comes, an' I slopin' down the quay, afeard iv my life iv the light ov the sun, by raison of my conscience not bein' saisoned into lobster-risin' that time; and jist as I was fetchin' a twisht to show the saimes of my stockings (for I made sure she was up to id all), what would sarve her, in the broad daylight, and afore the whole harbour, but up to me she comes, and throws her arms round my neck, and kisses and hugs me"—— The rest of the sentence has never transpired. It was overpowered, if uttered, and interrupted, if not, by the bursting in of the door, and the apparition of no less a personage than the Widow Wade herself, who rushed up to Pat Nelligan, and uttering the same words she had originally addressed to him in the very scene he had just been describing—"Oh, Pat!"—fell on the floor before him.

If a shell with the fusees just burnt out had fallen amongst the party, it could not have caused greater consternation or more decisive effects. Billy and Jerry gazed one instant on the prostrate form of the female before them, whom they supposed to be dead, and then looked round for Pat. He had disappeared; and, not to crowd my narrative with superfluous matter, it is enough to say, that he was never more heard of in Kilkettle.

The offenders. Billy Slattery and Jerry Green, having lost the start by half a minute, were seized by some neighbours, who rushed out on hearing the uproar; and if they did not suffer the full penalty of the sixty-third of William I., it was more likely it happened from a flaw in the indictment than from any unwillingness or inability in the witness, Mrs Wade, to give her testimony against them. But, as the direction of the public attention to such matters generally results in public good, the widow's monopoly was at an end; boats from distant villages and towns sunk their lines in the bays about Skerry Island, and though the widow continued to make as much as ever of her lobster-pots, many participated in her gains.

THE MINT.

[From the *Glasgow Herald* newspaper.]

A STRIKING illustration of the magnitude of the transactions of the British empire may be drawn from the recent records of the Mint. Between the years 1816 and 1836, the money coined in it amounted in round numbers to a quarter of a million of copper, twelve millions of silver, and considerably above fifty-five millions of gold, making a total of between sixty-seven and sixty-eight millions of money sent into circulation within twenty years. Whilst we are dealing with figures, we may add, that the charge for coining this enormous amount of precious metal was nearly four hundred and twenty-one thousand pounds, and the actual cost about two hundred and fourteen thousand pounds, leaving a profit to the company of moneyers not much less in amount. Any one may send bullion to be coined; but for many years the Bank of England alone has been the medium between the foreign importer and the Mint. During the lapse of time, the sources of our supplies of bullion have been frequently changed. Time was when even England itself added silver to the other inexhaustible stores which it was for ever pouring forth from its bosom; Edward I., for instance, received no less than seven hundred and four pounds' weight of silver during the year 1296 from Devonshire; and down to the reign of George I., silver money has been coined from the proceeds of the Welsh and other native mines. The principal sources of supply at present are the mines of Peru and Mexico for both silver and gold; and from the mines comparatively recently discovered in the Russian Ural mountains, a large quantity of gold is also received. The bank buys silver at the market price, which fluctuates—gold at L.3, 17s. 9d. per ounce; but it will make no purchase of gold without having first sent specimens for assay to the king's assay-master of the Mint. This is the simple history of our uncoined money generally. But there are some notable exceptions. A few weeks since, the newspapers of the day informed us that considerable interest was excited by the arrival in the borough of the first portion of the ransom payable by the Chinese nation to the British government, which amounted to two millions of dollars. It was placed in wooden chests, and filled ten waggons and carts, forming a train of considerable length, and was escorted by a detachment of the 32d regiment. The whole passed over London Bridge, and was conveyed to the bank. This money, which weighs upwards of 65 tons, was brought from China by her Majesty's ship Conway. It will, no doubt, ultimately be coined into British money; and we shall be circulating our shillings and sixpences to and fro without the slightest notion of their having once formed a part of the price of Canton—nay, for aught we know, some of them may, in their state of transformation, find their way back to the Celestial Empire, to gladden, possibly, for a second time, the eyes of some unconscious Chinese, and be treasured for their novelty in the sanctum cabinet where they had previously been hoarded for their intrinsic value. In 1804, a somewhat similar convoy passed through the streets, which had been taken under no less memorable circumstances. Political considerations having determined the British government to commence war with Spain, a bright notion occurred to it before making a formal declaration of its purposes. A number of Spanish vessels with treasure were then expected home; accordingly, Captain Moore, with four vessels, was dispatched to intercept them. He was successful; but did not obtain possession of the prize till the Spanish admiral's vessel had blown up, and some hundreds of persons had gone to their last account.* To the honour of the British people, their indignation was all but universal. There was one incident that did much to deepen the general impression of the affair. A Spanish gentleman was on board one of the ships, who, after twenty-five years' industry and economy in America, had realised a fortune, and was now returning to his native country, contented in its possession, and blessed with a numerous and beautiful family to share it. Before the action commenced, he, with one of his sons, went on board one of the largest ships—the better, perhaps, to assist in repelling so unexpected an attack—and in a few minutes beheld the one in which he had left his wife and his other children surrounded with flames. This was the admiral's ship, already mentioned. None of the humiliating and painful reflections attached to this case belonged to the one preceding it by some forty years, and which accordingly seems to have been marked by a very joyous sort of procession. The day was a remarkable one, being that on which the young sovereign, George III's first son and successor, was born—"Just after her majesty was safely in her bed, the waggons with the treasure of the 'Hermione' entered St James's Street, on which his majesty and the nobility went to the windows over the palace-gate to see them, and joined their acclamations on two such joyful occasions; from whence the procession proceeded to the Tower in the following order, namely—A company of light horse, attended with kettle-drums, French horns, trumpets, and hautboys; a covered waggon, decorated with an English and a Spanish flag underneath, hanging behind the waggons; two more covered waggons; seven wag-

* This was without exception the most disgraceful affair in which the English ever were engaged, and has stamped indelible infamy on the government of the day.—ED. C. E. J.

gons uncovered; and, lastly, a covered waggon decorated with an English jack and a Spanish flag;—in the whole, twenty waggons. The procession was concluded with an officer on horseback carrying an English ensign, attended by another holding a drawn cutlass. The escort to each waggon consisted of four marines with their bayonets fixed. The whole cavalcade was saluted by the people with acclamations of joy. On opening some of the chests at the bank, they were greatly surprised to find a bag full of gold instead of silver in one of them; several have since been found of the same kind." The treasure weighed sixty-five tons, and was valued at nearly a million sterling. In the last incident of this kind we shall mention, which occurred just a century before, the money was obtained without violence of any kind from its owners, yet not the less disgraceful was its possession. It was the purchase-money of Dunkirk, acquired by Cromwell, and so much valued by the English people, that just before the sale was concluded, the merchants of London offered, through the lord mayor, any sum of money to Charles rather than it should be lost. The offer, however, was declined. On one occasion Charles paid a visit to the Tower in person, in order to see the wealth he had so dearly purchased. Pepys had a hope of getting some portion of the treasure to pay off the naval arrears, but the king knew better how to dispose of it than on such merely national purposes.

REFORMING A WIFE.

Mynheer van der ——, who, in 1796, lived in high style on the Keizar Gragt, in Amsterdam, had a very pretty wife, who dressed most extravagantly, played high, gave expensive routs, and showed every disposition to squander money quite as fast as her husband gained it. She was young, handsome, vain, and giddy, and completely the slave of fashion. Her husband had not the politeness to allow himself to be ruined by her unfeeling folly and dissipation; he complained of her conduct to her parents and nearest relations, whose advice was of no more use than his own. Next he had recourse to a respectable minister of the Lutheran church, who might as well have preached to the dead. It was in vain to deny her money, for no tradesman would refuse to credit the elegant, the fascinating wife of the rich Van der ——. Involved as the young lady was in the vortex of fashionable dissipation, she had not yet ruined her health and reputation; and her husband, by the advice of his friend M—k—r, determined to send her for six months to a Verbatering Huisen, or house for the reformation of manners, such as is to be found in most of the towns in Holland. With the utmost secrecy he laid before the municipal authorities the most complete proofs of her wasteful extravagance and incorrigible levity; added to which, she had recently attached herself to gaming with French officers of rank, who lay under an imputation of being remarkably expert in levying contributions. She was already in debt upwards of thirty thousand florins to tradesmen, although her husband allowed her to take from his cashier a stipulated sum every month, which was more than sufficient to meet the current expenses of his household; while, to meet a loss which occurred in play, her finest jewels were deposited in the hands of a greedy money-lender, who accommodated the necessitous, upon unexceptionable security being previously left in his custody. Her husband was full twenty years older than his volatile wife, of whom he was rationally fond, and at whose reformation he aimed before she should be carried too far away by the stream of fashionable dissipation. Against his will, she had agreed to make one of a party of ladies who were invited to a grand ball and supper at the house of a woman of rank and faded character. Her husband, at breakfast, told her she must change her course of life, or her extravagance would make him a bankrupt, and her children beggars. She began her usual playful way of answer, saying, "She certainly had been a little too thoughtless, and would soon commence a thorough reformation." "You must begin to-day," said her husband; "and as a proof of your sincerity, I intreat you to drop the company of ——, and to spend the evening at home this day with me and your children." "Quite impossible, my dear sir," said the giddy wife in reply; "I have given my word, and cannot break it." "Then," said her husband, "if you go out this day dressed to meet that party, remember, for the next six months these doors will be barred against your return; are you still resolved to go?" "Yes," said the indignant lady, "if they were to be for ever barred against me!" Without either anger or malice, Mynheer van der —— told her "not to deceive herself, for as certain as that was her determination, so sure would she find his foretelling verified." She told him, "If nothing else had power to induce her to go, it would be his menaces." With this they parted—the husband to prepare the penitentiary chamber for his giddy young wife, and the latter to eclipse every rival at the ball that evening. To afford her a last chance of avoiding an ignominy which it pained him to inflict, he went once more to try to wean her from her imprudent courses, and proposed to set off that evening for Zutphen, where her mother dwelt; but he found her sullen, and busied with milliners and dress-makers, and all the paraphernalia of splendid attire. At the appointed hour the coach drove to the door, and the beautiful woman (full-dressed, or rather undressed) tripped gaily down stairs, and stepping lightly into the coach, told the driver to stop at ——, on the Keizar Gragt. It was then dark, and she was a little surprised to find the coach had passed one of the city gates; the sound of a clock awoke her, as if from a dream. She pulled the check-string, but the driver kept on; she then called out, when some one behind the coach told her, in a suppressed voice, that "she was a prisoner, and must be still." The shock was severe; she trembled in every limb, and was near fainting with terror and alarm, when the coach entered the gates of a Verbatering Huisen, where she was doomed to take up her residence. The matron of the house, a grave, severe, yet well-bred person, opened the door, and calling the lady by her name, requested her to alight. "Where am I? I beseech you to tell me; and why am I brought here?" "You will be informed of every thing, madam, if you will please to walk in doors." "Where is my husband?" she said, in wild affright; "sure he will not let me be murdered?" "It was your husband who drove you hither, madam; he is now upon the coach-box." This intelligence was conclusive; all her assurance forsook her; she submitted to be conducted into the house, and sat pale, mute, and trembling, her face and dress exhibiting the most striking contrast. The husband, deeply affected, first spoke. He told her "that he had no other means to save her from ruin, and he trusted the remedy would be effectual; and when she quitted that retreat, she would be worthy of his esteem." She then essayed, by the humblest protestations, by tears and intreaties, to be permitted to return, and vowed that never more whilst she lived would she offend him. "Save me," said she, "the mortification of this punishment, and my future conduct shall prove the sincerity of my reformation." Not to let her off too soon, she was shown her destined apartment and dress, the rules of the house, and the order for her confinement, during six months! She was completely overpowered with terror, and fell senseless on the floor. When she recovered, she found her husband chafing her temples, and expressing the utmost anxiety for her safety. "I have been unworthy of your affection," said the fair penitent, "but spare me this ignominious fate; take me back to your home, and never more shall you have cause to reproach me." Her husband, who loved her with unabated affection, notwithstanding all her levity, at last relented, and the same coach drove her back to her home, where not one of the domestics (a trusty man-servant excepted) had the least suspicion of what had occurred. As soon as her husband led her to her apartment, she dropped on her knees, and implored his pardon; told him the extent of all her debts, begged him to take her to Zutphen for a few weeks, and promised so to reduce her expenditure, as to make good the sums she had so inconsiderately thrown away. Allowing for the excessive terror she felt, when, instead of being driven to ——'s rout, she was proceeding round the ramparts outside the city gates, which she could not wholly overcome, she spent the happiest evening of her life with her husband; and from that day abandoned her former career of dissipated folly, and became all that her husband wished—a good wife and an affectionate mother. —*From a collection of Anecdotes.*

THE EARLY SETTLERS.

BY CAMILLA TOULMIN.

How strange a dream it seems to me,
To me now grey and old,
To ponder over hours, since which
Full fifty years have roll'd!
But busy memory opens yet
Her thickly crowded page,
Whose characters I still can trace
Undimm'd by toil or age.

More vivid far those pictures be
Than scenes more new and nigh,
For youth's warm records, they are stamp'd
With memory's deepest die.
Again I see that far-off land,
And hear the city's din,
And her, the gentle fair-hair'd girl,
Again, in thought, I win!

Our heritage was youth and love,
And hope with fairy wand,
(Ah! princes oft would change for these
Their sceptre, gold, and land.)
But time, which beauty makes or mars,
Hath silver'd her fair hair
And dimm'd her eye, yet still I read
Affection's language there!

Where then primeval forests stood,
The yellow corn now bends,
And with the nearer hum of bees,
Yon mill's harsh music blends!
Our grandchild's children prattle round,
While I muse o'er our lot,
Beneath the shadow of the tree
I planted on this spot!

The giant hills, which only heard
The wild bird's lonely shriek,
Now echo back, on every side,
The language Britons speak!
There's something glorious in such thoughts,
Which banishes regret,
Howe'er it chance that memory now
Forbids me to forget!

And here these aged limbs shall rest
When death's rude grasp shall come;
The founder of a vigorous race
Needs no mausoleum!
'Twill soothe that hour to know I leave
A happy, prosperous band;
My blessing rest upon the soil
That is *their Fatherland!*

ROYAL PREROGATIVE.

The *Athenæum*, in reviewing Bowyer's English Constitution, makes the following remarks on this subject:—"In glancing at the chapters on the royal prerogatives and authority, it has occurred to us, that, with all the constitutional sobriety of our English lawyers, they are not far behind the magnificent flights of oriental nations, in describing the attributes of 'thrones and dominations.' We do not mean to impugn the theoretical veracity of the legal 'idea' of a king or queen of England, but simply to remark, that to add to its sublimity would be scarcely possible. The attributes of the English crown, we are told by Mr Bowyer (who merely follows preceding writers on constitutional law), are, sovereign majesty, imperial power, inviolability, impeccability, absolute perfection, irresponsibility, incorruptibility of blood, ubiquity, and immortality! The queen is not only chief, but, we are told, *sole* magistrate, all other magisterial offices being merely derivative, or deputed. She is the arbitress of peace and war, the generalissimo of the army, and the head and supreme governor of the church. Then she is also described, in the language of the most exalted poetry, as the fountain of justice, the fountain of mercy, the fountain of honour, office, privilege. When all these truly grand conceptions are put together, they form a complex idea of monarchy immeasurably finer and loftier than any that the 'gorgeous east' has ever framed, because, in truth, approaching (peradventure rather too closely) to our idea of the Supreme Being. Omniscience seems to be the only divine quality that is not categorically predicated of the British crown, yet omniscience is evidently implied in the attribute of 'absolute perfection.' On the other hand, if many oriental titles are poetical and sublime, many are turgid and ridiculous, so that the entire *ideal* of the kingly power, where it is most unbounded, is far below the point to which it is exalted by the theoretical system of the nation, where it is most controlled and circumscribed. The king of Arracan, for example, is styled 'the possessor of the white elephant and the two ear-rings;' his majesty of Ava is hailed 'brother to the sun, and king of the four-and-twenty umbrellas!' Some of the titles of the kings of Orchan are, 'a king, spiritual as a ball is round, who, when he rises, shades all his people; from under whose feet is wafted a sweet odour,' &c. The sovereign of Monomotapa is the 'great magician,' and the 'great thief!' The shah of Persia is the 'branch of honour, the mirror of virtue, the rose of delight.' By the by, the 'branch of honour' and 'mirror of virtue' closely resemble our 'fountain of honour' and 'absolute perfection,' and the 'rose' is also the emblem of England; so that we are very Persian in our royal style."

PUBLIC SCHOOLS AND COLLEGE.

What can a father do? A public school is the regular thing—the fitting place for a young man of family and fortune; though your son may not acquire a greater knowledge of the classics for his three years' sojourn there, he may form acquaintances and connexions among the nobility and leading families, which, if he have but the wit to profit by, may ensure his advancement in after life. Nothing like interest and a friend at court, or rather friends. Who would send their children to Eton, Rugby, or any other public school, but for the sake of the connexions they form there? and its being considered a feather in their caps, and marking them as somebodies? "Whitehead! who is he?" inquires some impertinent puppy, with not a hundredth part of this same Whitehead's brains; and the whole party echo the sneering query. "Oh, Whitehead is a capital fellow; he was my chum at Eton," answers Lord Booby; whereupon the sneers are hushed, and the entire circle go the entire figure in Whitehead's favour, because he was Lord Booby's chum at Eton. As for the learning the boys get at public schools, it is, at the best, only like the thin scraping of butter over thick dry bread, such as is given at cheap preparatory schools, where little boys are sent who make too much noise at home. But, then, there are the friends—the acquaintances of which, as I said before, a clever lad can make so much. And as for book learning, how does that help a man on in life? No, no; it is knowledge of the world that helps a man forward; and I am up to this world and all its ways. Some people go about with one eye shut, but I always keep both wide open.—*Miss Pickering's Expectant.*

THOROUGH PERSONATION.

When Garrick was in France, he made a short excursion from the capital with the celebrated Parisian performer Preville. They were on horseback, and Preville took a fancy to act the part of a drunken cavalier. Garrick applauded the imitation, but told him he wanted one thing, which was essential to complete the picture—he did not *make his legs drunk*. "Hold, my friend," said he, "and I will show you an English blood, who, after having dined at a tavern, and swallowed three or four bottles of port, mounts his horse in a summer evening to go to his box in the country." He immediately proceeded to exhibit all the gradations of intoxication. He called to his servant that the sun and the fields were turning round him; whipped and spurred his horse until the animal reared and wheeled in every direction; at length he lost his whip, his feet seemed incapable of resting in the stirrups, the bridle dropt from his hand, and he appeared to have lost the use of all his faculties. Finally, he fell from his horse in such a death-like manner, that Preville gave an involuntary cry of horror, and his terror greatly increased when he found that his friend made no answer to his questions. After wiping the dust from his face, he asked again, with the emotion and anxiety of friendship, whether he was hurt. Garrick, whose eyes were close, half-opened one of them, hiccupped, and, with the most natural tone of intoxication, called for another glass. Preville was astonished; and when Garrick started up, and resumed his usual demeanour, the French actor exclaimed, "My friend, allow the scholar to embrace his master, and thank him for the valuable lesson he has given him!"—*Flowers of Anecdote.*

IGNORANCE AND ERROR.

It is almost as difficult to make a man unlearn his errors as his knowledge. Mal-information is more hopeless than non-information, for error is always more busy than ignorance. Ignorance is a blank sheet on which we may write, but error is a scribbled one on which we must first erase. Ignorance is contented to stand still with her back to the truth, but error is more presumptuous, and proceeds in the same direction. Ignorance has no light, but error follows a false one. The consequence is, that error, when she retraces her footsteps, has farther to go, before she can arrive at the truth, than ignorance. —*Lacon.*

A FEW WEEKS ON THE CONTINENT.

GENEVA.

THE stranger at Lausanne now finds the same kind of convenient arrangements for carrying him on his journey as he would have in some of our most improved English cities. Omnibuses make the round of the hotels at certain hours, to collect passengers for the steamers on the lake; and in one of these, on the morning after our return from Chillon, we were conveyed, in about a quarter of an hour, by a downhill road, to Ouchy. This is a village close on the shore of Lake Leman, no way remarkable in appearance, and possessing a tolerable inn, *L'Ancre*, opposite the quay, in which Lord Byron, in the space of two days, in 1816, when confined by bad weather, wrote his "Prisoner of Chillon." Little time was left for us to examine the place; the steamer moving up the lake from Villeneuve approached, and, along with a number of other passengers, we were conveyed to it in a row-boat from the shore. In a few minutes, we were on our way towards Geneva.

The sail up Lake Leman is one of the most exhilarating which it is possible to make. Above, we have a vast unclouded firmament of lovely blue; beneath, the beauteous sheet of water, unruffled by winds, and emulating the sky in its wondrous azure colour. On the right is spread out the long stretch of the canton of Vaud, rich in culture, and dotted with white villages; while on the left is Savoy, that dark and stern land, which no man may approach. I have tried to compare the scene in recollection with what one sees in the estuary of the Clyde and in a sail on our Highland lakes; but there is not a sufficiently near resemblance in either case to bear a just comparison. The most picturesque of the Scottish scenery is wild, lonely, and sometimes grand; but the hills are nowhere so stupendous as they are in Savoy, and they rarely bear that evidence of fertility which is the most pleasing feature of the lower Swiss mountains. Nowhere, I believe, in Europe is there any sheet of water equalling in beauty Lochs Lomond and Katrine, with their many bushy islands; but the banks of these lakes, and also arms of the sea in Scotland, are for the most part brown heathy hills, and convey an unpleasing impression of abandonment. Disposed as extensive sheep-walks by their owners, or let in patches to a set of poor and far from active peasantry, it is scarcely in the nature of things they should be otherwise. But placed in the free cantons of Switzerland, though at such altitudes as to afford little superiority in climate, the same mountain ranges would be well cultured and beautified—small fields enclosed, and forced by a diligent course of labour into fertility, fruit trees occupying the place of whin bushes, and the bleating of goats, or the tinkle of cow-bells, being heard instead of the wild cry of the partridge and curlew.

All this richness of scenery is observable on the Vaud side of the lake, which, taken in its whole extent from Chillon to Geneva, is unexampled for rural beauty, as well as for a social condition which has been styled the Paradise of the Swiss. As we advance, the lake widens, affording greater amplitude to the scene; and at the distance of a few miles from Ouchy, we have for the first time a distant view of Mont Blanc, which gives a new and striking feature to the piece. It is seen as a huge mass of jagged peaks, covered with snow, reposing in the midst of a tumultuous ocean of black hills of lower height, at the distance of from fifty to sixty miles inland from the Savoy side of the lake. Both the height and distance, however, of this gigantic mountain, appear nothing like the reality. This is a remarkable deception of the eye; and at a first glance, we should certainly say that the snowy peaks were not more than five or six thousand, in place of fifteen thousand, feet in height. A circumstance soon convinces us of our miscalculation. On the smooth face of the lake, from the vessel to the southern shore, an interval measuring from two to three miles, the stupendous mass is faithfully reflected as in a mirror—the brilliant white of the glaciers comes stealing along the unsullied surface of the lake, till it mingles and is lost among the blue spray, which is dashed aside by the wheels of our fast-proceeding vessel.

This blueness of the waters of Lake Leman is not the least interesting matter for observation in our voyage. The phenomenon has astonished and puzzled every body; and though many have tried to explain its cause, it is to this day one of the mysteries of natural science. The water, when taken up in a glass or the hand, is perfectly pure, like any other clear fresh water of lake or river; but when looked at in the mass, it is a beautiful Prussian blue, as if a liquor of that colour prepared for the operations of the dyer. As the Rhine and all its tributary lakes and streams are green, the blueness of Lake Leman is the more remarkable. The lake is very deep in some parts; so much so, that in winter certain parts of the surface do not freeze. The contents are also moving onward in correspondence with the volume of the Rhone, which enters at Villeneuve, and escapes in an impetuous broad current at Geneva, a mass of water seemingly equivalent to that of the Thames at Hammersmith. The lake is of a semicircular form, between forty and fifty miles in length, and six in breadth at the widest part. Towards Geneva it gradually narrows, being approached by high grounds; and here it has clearly forced a passage through the range of the Jura mountains, which are one entire calcareous mass, easily permeable by water. The country between the Lakes Leman and Neuchatel being flattish, attempts have been made in modern times to unite the two by an artificial canal; but what, by the force of capital, could be done in a few months in England, has never been accomplished in this comparatively primitive region. The French sigh for a water boundary to their country. Why did they not carry out this great undertaking under the empire? Sailing up the Rhine, they might have cut across Switzerland into Lake Leman, and down the Rhone to the Mediterranean. True, the Rhone, some miles below Geneva, dives below a mountain, and comes to light again. But Napoleon accomplished greater things than the removal of a mountain; and this would have added another imperishable exploit to his reputation.

But we must stop our speculations. The steamer is near the termination of its journey. The mass of the lake is left behind; and we have before us, nestling in an awkward gorge of the mountains, partly on a plain on the right and a high knoll on the left, the ancient city of Geneva. The quay is on the left, under the shadow of the older part of the town; in the middle of the Rhone, opposite, is a pretty islet covered with bushes, forming the central point of a long wooden bridge, which is extended to the right bank. The scene, on landing, reminded us of the bustle of a trading English town; and pushing our way onwards, we crossed the bridge to the Hotel des Bergues (meaning, I suppose, the hotel of the islands)—an enormously large and magnificent establishment, which I afterwards regretted having entered, both on account of its distance from the principal quay and the general hauteur of its conductors.

Geneva, as is pretty well known, is one of the most ancient cities in Europe, and has been the scene of many remarkable events in the history of civil and religious liberty. Like the contiguous district of the Pays de Vaud, it was once an heritable tenure of the Dukes of Savoy and a bishop, the citizens, however, possessing certain privileges from the German emperors. Constant disputes about the enjoyment of these rights, at length ended in an open war with the ducal government, which, by the aid of the Swiss, was overcome and expelled (1524); and in a few years afterwards, the bishop's authority was also put aside, by the general spread of the Reformation. The Dukes of Savoy made many efforts to regain possession of the town, but without avail; and in 1603 they abandoned the struggle, when a government by a privileged class of citizens was finally organised. This great reform was in time discovered to be no reform at all; every thing being managed, or rather mismanaged, by an oligarchy more tyrannical than the dukes or bishops, and, in 1781, the people broke into a revolt. The disturbance was quelled by the armed intervention of France in favour of the ruling party, whereupon many of the most industrious families voluntarily emigrated to America and other countries. A day of fearful reckoning arrived. The French Revolution broke out; and spreading to Geneva, scenes of revenge and cruelty were enacted equally horrible with those in Paris. In 1798, the city was incorporated with France, and it remained in this state till the restoration of its independence in 1814; since which period it has, along with a few miles of territory around, formed a distinct canton in the Swiss confederation. The restored government was injudiciously modelled on an oligarchical principle, and has within the last few months been quietly reformed, and a more popular constitution set up in its place, on a plan similar to what has proved so suitable in Berne, Vaud, and other revolutionised cantons.

The reader will now be prepared to understand, that whatever Geneva may have been formerly, it is in the present day a French town as respects language, and partly manners and sentiments, but endowed with that heedful regard for industrial pursuits and rational advancement which gives the place a distinguished name among continental cities. Among the foremost to embrace the Reformation, the inhabitants have ever readily afforded an asylum to the oppressed from all nations;* and now that religious intolerance no longer drives folk from their homes, Geneva remains a place of resort and settlement for intelligent strangers from every quarter. Few towns of its size can boast of having been the residence of so many men eminent in science and literature; and no one can see its orderly state of society, its numerous learned institutions, and its charming environs, so well calculated to be the seat of elegant retirement, without acknowledging that it is deserving of the honour.

Since 1816, when the canton and city were favoured with the management of their own affairs, they have steadily gone upon a course of improvement and prosperity. Like some of our English towns, Geneva is found in the present day to be in a state of transition

* Sismondi said the chief glory of Geneva resulted from its having been the asylum of the oppressed from all parts of Europe. "I can never think without emotion," he continued, "of the band of French Protestants who came here for refuge." His voice was choked; after a moment, he added, "When they reached the summit of the Jura, and saw the lake and city before them, they all, with one accord, fell on their knees and sung a psalm!" His tears again interrupted him, and he apologised for them, saying, "Ce sont les choses qui me meuvent le plus; je ne peux jamais en parler."—(These are the sort of things that most move me; I cannot speak of them.)—*Letters from Abroad, by Miss Sedgwick.*

from the antiquated and mean accommodations of a former age to spaciousness and splendour. Along the quays, on both sides of the Rhone, tall houses of sandstone, in the most handsome style of architecture, have been erected; and a very beautiful street of the same description has been laid out in the western quarter of the ancient city. Within this older part, which is seen towering to a great height, there is as yet little alteration. The dingy and not over-cleanly streets wind in lines to the summit of the eminence, which is conspicuously crowned with the ancient Gothic church of St Peter—the church in which Knox listened to the thunderings of Calvin, and whence he carried that ecclesiastical polity and those doctrines which he planted in Scotland. At a short distance from this aged structure are situated various public buildings, including the college and municipal establishments, but the whole jammed up among courts and alleys on no regular plan, as was generally the case in old walled cities. The principal access to the high town is by a long winding road on the west; and here, on the right, as we ascend, space has been found within the extended fortifications for a botanic garden, laid out in 1816 by Decandolle, and always open to the public. Near its entrance stands the theatre, a handsome modern edifice.

The charm of Geneva is less within than without the town. Towards the south, the open country is limited, in consequence of the abrupt rise of Mount Saleve, a high hill, from which a magnificent prospect is obtained of Mont Blanc and the neighbouring heights of Savoy, also of the lake, and country on its northern shores. Beneath, on the Savoy side, within the Genevese territory, there are some pleasant spots; but on the northern or altogether Swiss side, facing the sun, the eye rests upon a series of pleasure grounds and villas, spreading uninterruptedly for miles. It is not alone the positive rural beauty of such a scene that delights us, but its association in the mind with peaceful industry and security—the industry which realised wealth to establish these retreats, and the consciousness of security from depredation which a condition of civil tranquillity affords.

Writers differ with respect to the changes which have been effected in the religious condition of the Genevese, and as a transient visitant, I am not able to say which is in the right. The day after our arrival was Sunday, and we had at least an opportunity of seeing how it was kept in comparison with other places we had visited. It did not appear that the estimate formed generally of the religious character of that day differed in any material degree from what is observable in most other parts of the continent. The churches were poorly attended, and mostly by women. Coaches and caleches rattled along the streets with parties sallying out of town; steam-boats departed from the quay loaded with passengers, engaged in a holiday excursion to a place somewhere on the lake, at which there was to be a fête; coffee and billiard rooms, and a number of shops for the sale of light articles, were open; and in one of the streets there were congregated some hundreds of rustic labourers, each with a flail over his shoulder, waiting to hire themselves, as in a market. In the evening all was gaiety and life in the public promenades outside the walls; at the same time we saw nothing like disorder, and as night closed in upon a sultry day, crowds of well-dressed men, women, and children, poured homeward through the gateways, apparently pleased with the recreations in which they had been indulging. What Calvin would have thought of this mode of keeping Sunday, it is not easy to say. That reformer, austere as were his views, protested, I believe, against the idea of transferring the formalities of the Jewish Sabbath into the scheme of Christian ordinances; and therefore the Genevese, as far as harmless recreations are concerned, have perhaps, after all, less departed from the customs of their fathers than one might be inclined to suppose. At the same time, it is tolerably evident that, as in other countries which had been swept and kept possession of by French troops, religion has been reduced to a meagre outline of what it formerly was, and is now little better than a formal arrangement supported by the state. Miss Sedgwick, a late tourist, speaks favourably of the moral qualities of the Genevese, particularly the female part of the community. Conversing with her intelligent friend Madame Sismondi (an Englishwoman), that lady informed her of an institution to which much virtue was to be imputed. "This is the *Société des Dimanches* (the Sunday Society). When a girl attains the age of five years, she is made a member of a *Société des Dimanches*, consisting of the children of her mother's friends. They meet every Sunday afternoon, attended only by a nurse or governess, who does not prescribe their amusements, and only interferes in cases of necessity. The first girl of the community who marries gives her name to the society, and as soon as there is a married woman among them, young men are admitted, on application, by vote of the sisterhood. Their meetings continue through life. Madame Sismondi says this association supplies to the lonely the attachments and aids of a family circle; that if a girl falls into misfortune, she is succoured by her companions; if her father's fortunes are ruined, there is no apparent change in her condition. This institution is confined to the native Genevese; of course Madame S. is excluded, and her favourable opinion is the result of her observation of its effects, and not of an *esprit de corps*. Sismondi is a member of three societies, Decandolle of every one in the place."

The account of these arrangements conveys a favourable idea of the morals and simplicity of manners of the Genevese. Nothing of the kind could exist in our highly artificial state of society. Some persons express a fear that the institutions spoken of will not flourish any length of time in Geneva, where society will gradually get into the condition it is in this country; in other words, that the progress of manufacturing industry will probably split society into two unequal portions—wealthy capitalists on the one hand, and a mass of employed artisans on the other. But though there be a tendency this way, it is more than probable that the universal equality of political privileges will prevent the degradation which is painfully observable in the large towns of Britain. Independently of the chance of benefit on this score, it is fortunate that the working classes of Geneva, among whom many able foreigners are included, are remarkable for a prudential economy and foresight, which will save them from descending low in the scale of existence. Dr Bowring, in his Report, presents some agreeable information on this interesting subject. He mentions that a Savings' Bank in the town is well supported; the number of depositors in 1835, out of a general population of 28,000, being 7279. This would show the extraordinary fact, that every fourth person was a depositor; but it is probable that many belonged to the country. The total deposits amounted to 5,136,171 florins (about L.450,000). The working classes also supported a sick-allowance society, an institution useful in its way, but equalled in importance by another, consisting of a union of all classes of operatives for mutual instruction in general literature and science, and the staple arts and manufactures in which they are engaged. Not having the slightest reason for spending time on political grievances, the whole mind is left to be bent on matters of practical and personal concern; and no city in Europe of its size could exhibit a greater amount of artistic labour directed by skill and cultivated taste. The state being in reality the people, holds out every reasonable encouragement to education and social improvement. Although requiring to be lately re-organised to meet popular demands, the cantonal administration of Geneva is allowed to have managed affairs with sound discretion, and at all events kept the canton not only out of debt, but with a surplus revenue to dispose of on public works. According to Bowring, in 1835, when the total population of the canton was 56,655, the annual revenue, on an average of the preceding five years, was 867,000 French francs, showing a surplus over expenditure of 85,000 francs. The chief taxes were light indirect imposts, no way interruptive of a free import trade, with a small personal tax on all householders possessing the elective franchise. Every expense of administration, military defence, police, religious and secular instruction, roads, &c., was liquidated from the above income. Protestant and Catholic clergy are equally stipendaries of the state: the annual cost of the Protestant church was 62,000, and that of the Catholics 44,000 francs: the highest allowance to a Protestant pastor of Geneva was 2800 francs (£111, 13s. 4d).

For a number of years the principal trades of Geneva have referred principally to watches, jewellery, and musical boxes. We had scarcely been seated in our hotel, when a letter was handed in from a jeweller (how he got my address, unless from the Post-office, it was impossible to divine), representing how much he would be obliged by an inspection of his stock of *bijouterie*. The ladies, of course, were delighted with the invitation, and I was not disinclined to get some information on this important branch of traffic. What we saw here and elsewhere was beautiful in the extreme, native taste being incessantly spurred on to compete with foreign markets, and maintain the pre-eminence it has reached. The number of master watchmakers is above 300, and of master jewellers and mechanics nearly 200. I shall not here say any thing of the Genevese watches, of which 10,000 are said to be smuggled into England annually, as the subject may be appropriately united with what I saw and learned of the watchmaking business in the canton of Neuchatel. The manufacture of musical boxes of a delicate kind, is more particularly settled in Geneva, and deservedly commands a most extensive export trade. The art of making these articles has been greatly promoted by attention to the various tones of metal, and education in the science of harmony. Here we have another most pleasing instance of a population, infinitely less favoured in point of situation than the inhabitants of any English or Scotch town, striking out a flourishing handicraft by sheer dint of patience and culture. It would delight any one to see the many exquisitely finished little articles in gold, in value from one to a hundred guineas, fitted up as musical instruments, in the shops of the Genevese jewellers. An object was shown to us resembling a small golden vase on a stand, measuring about six inches in height, which, on being touched at a spring, fell open, and disclosed a bird of elegant plumage, little larger than a bee, that instantly fluttered its tiny wings, and strained its throat with a most melodious tune. The cost of this elegant article was 2000 francs. It may be asked, Who buys such expensive toys? Twenty thousand strangers, with money in their pockets, pass through the town annually, almost every one carrying off something or other that pleases the fancy. A golden bracelet containing a watch the size of a shilling was among the latest inventions, and it would in all likelihood excite the desires of some of the wealthy lady visitants. But the bulk of the articles is exported for foreign consumption. In France, America, England, and most other countries advanced in civilisation, there are at all times hosts of persons enjoying exuberant opulence, and able to gratify their feelings by making expensive presents of affection; and it is to such that the skilful artists of Geneva look for a patronage of their wares.

THE ROMAN SATIRIST, JUVENAL.

Of the life of this poet but few details have reached us, and these few are confused and uncertain. Unlike his communicative predecessors in the province of satire, Horace and Persius, he seldom indulges the reader with a peep into his private history; and nearly all, in consequence, that is known concerning him, is derived from an extraneous source. Decimus Junius Juvenalis was born at Aquirum, a town in Campania, about A. D. 38. His father, or foster-father, was a wealthy freedman. Being bred to the bar, the passionate energy of his pleadings speedily gained for him a high reputation. At a mature age, he began to assay that species of composition of which he is indisputably the greatest master. His first attempt was directed against an actor named Paris, an unworthy favourite of the profligate Domitian, whom he ventured to describe not only as the patron of dramatic literature, but as the all-potent dispenser of military preferment. The attack was resented by the haughty upstart, who chose facetiously to punish the author of the lampoon by procuring his banishment to Egypt, on pretext of a commission in the army. The poet, however, soon returned to Rome, and continued fearlessly his noble task of reforming the public morals. He expired A. D. 119, at the advanced age of eighty, in a fit of coughing.

Juvenal is said to have been tall in person, and seems throughout his life to have possessed a competence. His mental characteristics are inscribed, with such plainness as to preclude mistake, on every page of his writings. A hater he was of *shams*; an earnest, sturdy antagonist of vice; a rough, plain, truth-speaker; an honest, intrepid, straightforward man.

The satires of Juvenal, of which there are sixteen, containing some three thousand six hundred lines, deserve to be ranked with the most valuable remains of antiquity. The following passage from the first, embodies the author's statement of his subject, and may, perhaps, convey a good idea of his style. The version is our own.

> "Dost wish to rise? Dare something that deserves
> The dungeon: probity is praised, and starves.*
> Men owe their mansions in these precious times,
> Their gardens, citron tables, to their crimes.
> In days like ours, when guilt hath dye so deep,
> Whom will unblushing vice permit to sleep?
> Is genius wanting?—rage will rhyme supply
> Such as may Cluvienus scrawl, or I.
> From that far age, when old Deucalion found
> First for his ark undeluged resting-ground,
> Whate'er men do or feel, my verse engage!
> Their likings, joys, discoursings, terrors, rage—
> This be the staple of my motley page!
> And when was richer crop of crimes, or when
> Did avarice spread a bolder sail 'mong men?
> No more with paltry purse to play they go,
> But stake whole fortunes on a single throw.
> The rival gamesters glow with martial fire;
> Each has his steward standing by as squire:
> The monied minister of each attends,
> And each the sinews of the war he lends.
> Besotted idiots! thus a plum to lose,
> And yet your shivering slave a common cloak refuse!
> Our fathers' generous frugality
> No selfish pleasure sought; but now you see
> The costly private feast, while clients wait
> Clamorous for alms before the patron's gate:
> The cautious steward weighs each claim with care,
> Lest some impostor smuggle off a share;
> Then doles their pittance forth to them that joy
> To trace their lordly lineage back to Troy.
> For there, to rob the poor—oh! burning shame—
> Full oft are seen our men of note and name;
> Praetors and tribunes with the herd must share,
> And, candidates for alms, stand begging there!"

From this passage it appears that one of the chief symptoms of Roman degeneracy was the breaking up of the old connexion between patron and client—a sort of civic clanship which knit together, by a reciprocation of good offices, the upper and lower grades, in the best days of the Commonwealth. Luxury and arbitrary power had rendered the nobles supercilious and selfish—dispositions which proved, in the case of their inferiors, the preludes to servility and discontent. No longer, as in the olden time, admitted to the boards of their patrons, the common people were served, like paupers at a soup-kitchen, with a small basket of provisions, or a trifling sum of money in lieu of it, at the gate of the great man. Numbers who could have readily dispensed with this gratuity were

* Compare Massinger—

> "Virtue long ago,
> It was but praised and starved; but now-a-days
> 'Tis far more cold, and has nor love nor praise."

found mean enough to claim it; and the pride of independence was too often divorced from the pride of pedigree.

The seventh satire is a severe rebuke of the niggardly treatment of poets and preceptors. Our author contrasts, with the paltry compensation awarded to distinguished genius and erudition, the lavish expenditure of the Roman grandees when their own vanity or convenience was to be consulted—

> "What! shall *they* tarry till the sky be clear,
> Or splash their mule so sleek? No; rather here—
> Here rather let them ride, for here the beast
> May keep its hoofs unsullied at the least.
> Yet more: on columns of enormous size,
> They bid a spacious eating-room arise,
> Which fronts the east, wide opening to the day,
> Ere yet the sun emit too warm a ray.
> Expensive these; but cost whate'er they will,
> Sewers must be hired, and cooks of taste and skill.
> 'Midst this extravagance that knows no bounds,
> Quintilian gets, and hardly gets, ten pounds
> For all his pains: there's no possession, none,
> That costs a sire so little as a son."
>
> * * * * *

The mean practice of cheapening school fees, and the drudgery of the ill-starred instructor, are thus happily pourtrayed. Both sides of the picture might pass for modern. This and the former version are by Gifford.

> "Courage, Palæmon! be not over nice,
> But suffer some abatement in your price;
> As those who deal in rags will ask you high,
> And sink by pence and halfpence till you buy.
> Yes, suffer this! while *something's* left to pay
> Thy rising hours before the break of day,
> When e'en the labouring poor their slumbers take,
> And not a weaver nor a smith's awake:
> While *something's* left to pay thee for the stench
> Of smouldering lamps, thick hung on every bench;
> Where ropy vapours Virgil's pages soil,
> And Horace looks one blot—all soot and oil:
> Even then the salary thus reduced, thus small,
> Without a law-suit rarely comes at all."

As a sample of our poet's boldness of invective against wickedness in high places, we next translate a portion of the eighth satire. A full recital of the atrocities and follies of Nero is unnecessary to any one who is moderately read in Roman history. Suffice it to state, that this prodigy of crime put to death his mother Agrippina, his two wives, his brother Britannicus, his aunt, and his preceptor, the illustrious Seneca. Orestes, the Hamlet of ancient tragedy, the poet would therefore deem affronted by being named in the same breath with him. His freaks as a public singer are likewise commented on in a fine strain of indignant irony. In this character the emperor made the tour of Greece, challenging and compelling, wherever he went, an open competition, and using paltry arts to secure the prize—a chaplet of parsley, which no one was at all ambitious to carry off from so dangerous a rival. It was respecting his vocal powers that flattery found him most accessible; and the *divine voice*, as it was called, had actually its shrines and sacrifices. Nero, on his part, spared no pains to improve it; and when we think of his lying for hours together with sheets of lead upon his chest, and swallowing with cheerfulness the most nauseous drugs, to strengthen the organs which were naturally unfit for producing aught but shrill and discordant sounds, we might, were we not heart-sick at the enormities of the tyrant, afford to smile at the oddities of the madman.

> "Oh! could the people will who'd hold the sway,
> Which would they have—Nero or Seneca?
> The sage, or matricide whose hideous vice
> To punish, will *one* ape, snake, sack, suffice?
> Will one poor death the monster's guilt atone,
> And must so many lives be paid by one?
> Orestes-like, a mother's murderer he,
> And yet without Orestes' purging plea—
> A father's blood avenging by high heaven's decree.
> Nor took the Argive sad Electra's life,
> Nor callous butcher'd he his Spartan wife;
> Ne'er mixed he aconite, with hellish rage,
> For kith and kin; ne'er sang upon the stage;
> And folly's climax Nero left, who'd fain
> Turn bard, and write the Iliad o'er again!
> Such are his deeds, the prince, the nobly born!
> Who glories, abject! in the public scorn.
> Come, fetch thou now thy pious offering;
> His Grecian garlands let the victor bring!
> Before thy fathers pay thy duteous vows,
> And bind thy parsley round the Cæsar's brows."

An allusion in the preceding verses requires to be explained. By the Roman law, a parricide was condemned to be sewed up in a sack along with an ape, a dog, a serpent, and a cock, and thus cast into the sea. The selection of animals was doubtless significant, though we cannot tell exactly how. Cicero, in a striking though florid passage, considers the main prescription as intimating the general sense of his countrymen that those who had been guilty of such enormities were unworthy, while they yet remained in life, to enjoy its most potent blessings—unworthy to look on the same sun with other men, to touch the same earth, or to breathe the same air.

The tenth satire, which has been imitated by Johnson in his "Vanity of Human Wishes," is, perhaps, morally considered, the noblest production of profane antiquity. The various objects men set their hearts on, irrespective of higher aims, fall successively under review, and the conclusion coincides with that of inspired wisdom—"Vanity of vanities, all is vanity!" We give the extracts from this performance in the fine version of Mr Elton. Martial glory is thus anatomised—

> "The spoils of war; a coat of mail, fix'd high
> On trophied trunk, in emblem'd victory;
> A dangling beaver from its helmet cleft,
> A chariot's shiver'd beam; a pendant reft
> From boarded galley; and the captive shown
> On the triumphal arch in imaged stone;—
> Behold the sum of grandeur and of bliss!
> Greek, Roman, and barbarian aim at this!
> Hence the hot toil and hair-breadth peril came,
> For less the thirst of virtue than of fame.
> Who clasps mere naked virtue in his arms?
> Strip off the tinsel, she no longer charms.
> Yet has the glory of some few great names
> Enwrapt our country in destroying flames—
> This thirst of praise, and chisel'd titles, read
> On stones that guard the ashes of the dead."

Alexander the Great is fixed on, along with Hannibal and Xerxes, to illustrate the futility of military fame.

> "Lo! Pella's youth was cabin'd, cribb'd, confined
> Within one world too narrow for his mind:
> Restless he turn'd in feverous discontent,
> As if by Yyaras' rocks or scant Seriphum pent.
> But brick-wall'd Babylon gave ample room;
> Content he stretch'd him in a catacomb:
> Death, death alone, the conscious truth attests,
> What dwarfish frame this swelling soul invests."

The conclusion of the whole matter is thus grandly given:—

> "Shall man, then, nothing wish? Advised by me,
> Let the good gods themselves consult for thee;
> For a sane mind in a sane body pray,
> A soul that looks on death without dismay;
> That firm prepares the course of life to run,
> And thanks kind Nature when the race is done;
> A soul that strenuous toils could never tire;
> From anger calm; superior to desire;
> That rather would the Herculean labours prove,
> Than banquets, beds of down, and melting sloth of love.
> I show thee that which needs not prayer to gain,
> Which of thyself thou surely may'st obtain;
> The path of tranquil life through virtue lies;
> With prudence, thou hast all the deities:
> 'Tis we, O Fortune! who thy power have given;
> Our weak desires have set thy throne in Heaven."

In the next specimen we have a fine exposition of the progress and the tyranny of avarice. As domestic servants in this country have their fixed quantities of sugar, &c., so the Roman slave had his stated allowance of bread-corn, which was dispensed to him monthly; the usual rate was a quart per day. We use Mr Gifford's version.

> "Vice boasts its A B C, like other arts;
> These he* inculcates first; anon imparts
> The paltry tricks of saving; last inspires
> Of endless wealth the insatiable desires.
> Hungry himself, his hungry slaves he cheats,
> With scanty measure and unfaithful weights;
> And sees them lessen, with apparent dread,
> The musty fragments of his vinewed bread.
> In dog-days, when the sun, with fervent power,
> Corrupts the freshest meat from hour to hour,
> He saves the last night's hash; sets by a dish
> Of sodden beans, and scraps of summer fish,
> And half a stinking shad, and a few strings
> Of a chopp'd leek, counted like sacred things,
> And seal'd with caution; though the sight and smell
> Would a starved beggar from the mess repel.
> But why this curst avidity of gain;
> This mass collected with such toil and pain—
> Since 'tis the veriest madness to live poor,
> To die with bags and coffers brimming o'er
> Besides, while thus the streams of affluence roll,
> They nurse the eternal dropsy of the soul;
> For thirst of wealth still grows with wealth increased,
> And they desire it less who have it least."

The reader has now before him, to some extent, the means of forming his own judgment respecting the merits of Juvenal. In his own province he is unmatched. Combining the characteristic excellences of both his illustrious predecessors—Horace's profound knowledge of human nature with the lofty moral tone of Persius—he gives the "very age and body of the time—its form and pressure," while he shows himself untainted by its wide-spread profligacy. When he addresses himself to the task of laying bare

> "All thoughts, all passions, all delights,
> Whatever stirs this mortal frame,"

he is not overrating his own acquaintance with the heart. Nor does he show that his science has been too dearly purchased. If he smile at vice, it is with that sardonic expression which proves hatred to predominate over mirth. But it is his wont to launch at once into fierce, earnest, withering invective. He cannot palter with pass and parry, but deals his blows thick and heavy on the head of the foeman: others may have patience to sap, he must be forward to storm. He does not therefore affect those lighter graces, that assiduous polish, those imaginative flights, which often enfeeble while they adorn composition. If we sometimes liken the lyrist to the lark, caroling far away in the joyous sun-blaze, and the bard of elegy to the nightingale, chanting sadly in the shade, we must remember that the satirist is no singing-bird but a creature of prey. We will err egregiously, however, if we conceive of Juvenal as a clumsy or careless writer. Masters of thought, and he is one of them, are wont to be masters of language; and we find, accordingly, in his works, a diction uniformly masculine and correct, and often exquisitely delicate. His vindication from the charge of occasionally pandering, by the freedom of his descriptions, to the cravings of a prurient fancy, will be best effected in the words of Mr Gifford. "I should resign him in silence," says he, "to the hatred of mankind, if his aim, like that of too many others, whose works are read with delight, had been to render vice amiable, to fling his seducing colours over impurity, and inflame the passions by meretricious hints at what is only innoxious when exposed in native deformity; but when I find that his views are to render depravity loathsome, that every thing which can alarm or disgust is directed at her in his terrible page, I forget the grossness of the execution in the excellence of the design, and pay my involuntary homage to that integrity which, fearlessly calling in strong description to the aid of virtue, attempts to purify the passions at the hazard of wounding our delicacy and offending our taste." Juvenal, in short, felt strongly, and spoke as he felt; and of all his country's poets, to his honour be it said, it is he, beyond all question, who is most grandly Roman.

* The avaricious parent.

ADVENTURE OF A TRAVELLER.

In the year 1836, as a young surgeon of Florence, called Alberto Riquetti, was returning at a late hour to his own house, he stumbled over the body of a person who was lying near his door, and crying feebly for help. Ever anxious to succour the distressed, Riquetti, with the assistance of his servant, lifted the stranger into his surgery, where he dressed several very dangerous wounds which he found about his person; and then, as the night was too far advanced to carry him any where else, he put him to bed.

On the following morning he found the patient so ill, that he entertained very little hopes of his recovery; and as to remove him would have been indisputably fatal, he allowed him to remain where he was. On the second day he was so bad that Riquetti doubted his surviving four-and-twenty hours longer; and having acquainted him with his situation, he proceeded to inquire his name and station, and sought to ascertain if he had any friends or relations whom he would desire to see, or to whom, should his death ensue, he would wish the event to be communicated. The man answered that, with respect to his name, he was called Gasparo; but for the rest, he requested that a confessor might be sent for, to whom he would make known whatever was necessary.

This desire was complied with, and what passed between the patient and the priest, of course, remained unknown. But when the holy man came forth of the stranger's chamber, his whole demeanour denoted awe and terror; his cheeks and lips were bloodless; his hands trembled; and ever and anon he lifted them up to heaven, as if praying for the soul of a great sinner. The only words he uttered were, to desire that, when the man he had confessed was dead, he should be immediately informed.

However, Gasparo did not die. He was in the prime of life; and a good constitution, and the constant care of the surgeon, saved him. As soon as he was well enough to walk away, he left his benefactor's house, expressing the most ardent gratitude for Riquetti's kindness, and calling down blessings on his head for the persevering skill and care which had rescued him from the grave; but he went as he came, unknown; no word had he ever dropped that threw the slightest ray of light on his past history or future whereabout, and in the memory of the young surgeon he lived only as *Gasparo, the wounded stranger*.

In the winter of 1839, Alberto Riquetti was seized with an indisposition, for which, as it had been chiefly induced by too much application to his business, a little recreation was pronounced the best remedy. So with this view he resolved on an excursion to Rome, where he promised himself much pleasure in inspecting the antiquities, more especially the ancient Etruscan tombs, which had lately excited so much interest amongst the learned, and most of which were within a short distance of the city.

For the sake of those who may yet be unacquainted with the history of these curious relics, it may be as well to mention, that the Etrurians were a celebrated people of Italy, anterior to the Romans, and occupying the country west of the Tiber. The extent of territory which they possessed, though not great, was nevertheless divided into twelve different states, each of which was governed by its respective king, or, as they called him, *lucumon*; and in spite of the diminutive space they occupied on the globe, they were, relatively to their neighbours, a very powerful people, wealthy, luxurious, and refined. The taste and proficiency they had attained in the fine arts, as well as much of their manners, customs, and modes of living, have been placed before us in a very extraordinary manner by the discovery of the ancient tombs above alluded to, which are, in fact, small chambers hollowed out of the sides of hills, and which appear to have been the resting-places prepared for the mortal remains of the wealthy and the noble. Although the bodies which reposed in these ancient receptacles have long mouldered into dust, and although the Etrurians, with their kingdoms and their principalities, powers, wars, councils, commerce, luxuries, virtues, superstitions, and vices, have long passed from the earth, and some faint records only remain to tell us of their greatness, yet from their tombs they speak to us again; here, in their "very habits as they lived," they lift up their voices and cry to us, "Behold! thus did we three thousand years ago!"—for the paintings on the walls of these excavations show us this ancient people in almost every condition of life. We see them at their banquets and their diversions, at their marriages and their funerals, engaged in their athletic games, dancing, playing on various instruments, and

even on their deathbeds. Various curious and valuable specimens of their ornaments, vases, and armour, have also been found in these dwellings of the dead, as well as the sarcophagi in which the body had been deposited. The Etrurians were the most powerful and resolute enemies the rising empire of the Romans had to contend with, and were not conquered till after long wars and much effusion of blood and treasure had exhausted their strength.

Having given this little sketch of one of the most interesting specimens of antiquity in Italy, we will now return to our hero.

It was on a fine morning of the early spring that Alberto Riquetti started on his expedition to the Etruscan tombs, the first visit he proposed being to the necropolis of the ancient city of Veii—a city, by the way, which it cost the Romans many a hard battle to win, and which, after holding out a siege of ten years, was at length taken by their famous general, Camillus, about four hundred years before the Christian era.

Veii, or rather the spot where Veii once stood, is situated about twelve miles from Rome, on one of the roads to Florence. For the first nine or ten miles the way lies along the high road, but, at a village called Fossa, it diverges, and for about two miles more leads across some fields, till it terminates at a place called the Isola Farnese, where there is an inn at which travellers put up, and where, although the site of Veii is two miles further still, they are obliged to leave their horses and carriages, as beyond this point there is no practicable road.

The Isola Farnese is a quiet little hamlet, situated on a rising ground, surrounded by cliffs, and streams, and picturesque rocks, and murmuring waterfalls, adorned by a pretty inn and an ancient and venerable fortress. The inhabitants, who are all shepherds and vine-dressers, are extremely civil to travellers, and have an air of innocence and rural simplicity that, to a frequenter of cities like Alberto Riquetti, was quite irresistible.

"Here," thought he, "must the crimes, and vices, and miseries of a great city be unknown, and probably unsuspected. How few of the dwellers in this little Eden have ever extended their travels even as far as Rome! Their vines and their flocks are enough for them. Above want and below ambition, their minds must be pure and their lives happy. It is quite a subject for a poet."

The innkeeper, too, was the most civil and obsequious of innkeepers—quite a pattern of an innkeeper; and Alberto Riquetti was so charmed and fascinated by all he saw, that he resolved to make the Isola Farnese his head quarters, and thence extend his excursions to the different objects of curiosity around.

As the first day was to be devoted to the necropolis of Veii, after refreshing himself with a crust of bread and a glass of wine, he asked for a guide, who, being immediately presented to him, he set forth on his expedition, having informed his host that, as he should be occupied all day in sight-seeing, he should not care to have any dinner, but that he wished a good supper to be provided against his return at night—a request which the worthy Boniface assured him should be strictly attended to. "Indeed," he said, "he was generally in the habit of acting as cook himself, and he thought he might venture to promise his guest a ragout, the like of which he had never tasted—he was particularly famous for his ragouts; indeed," added he, "most travellers who eat them find them so good, that they are never inclined to taste another."

"Except of your making, I suppose?" said Riquetti, smiling.

"Of course—that's understood," answered the host.

"A tolerably conceited fellow," thought our traveller, as he followed his guide in the direction of Veii. The guide seemed to be of the same opinion, for he chuckled and laughed, and appeared greatly diverted with this explosion of the host's self-love.

"I suppose you have a good many travellers here?" said Riquetti.

"Not in the winter," answered the man; "you are the first we have seen for this long time. You come from Florence?"

"Yes, I do," replied Riquetti. "How did you know that?"

"I happened to hear the postilion that drove you tell the innkeeper so, and that you were making a tour for your health."

"That's true, too," said Riquetti, rather wondering how the postilion, whom he had never seen before, should have learnt so much about him.

"It's dull travelling alone," continued the man; "particularly when a person's sick and out of health; but perhaps you are a bachelor, and have nobody to look much after you?"

"I am a bachelor, certainly," said Riquetti, rather amused at the curiosity the man was exhibiting. "Unsophisticated nature," thought he, "savages, and uncivilised people, are always inquisitive;" so, without taking offence at the interrogations, he answered as many as the guide chose to put to him.

In the meantime they advanced slowly on the road to Veii, stopping ever and anon to inspect the different points of view, and examine every thing that appeared to present a vestige of antiquity; when, in rounding a point of rock, they came suddenly upon a little hovel, before the door of which stood a man scraping and tying up in bundles the sticks which, at another period of the year, are used for training the vines. At the sound of the approaching footsteps the man lifted up his head, and as his eye fell upon the surgeon, he started visibly, and an expression of surprise passed over his countenance. He even parted his lips, as if, upon the impulse of the moment, he was about to speak; but suddenly closing them again, after giving one look at the traveller, he stooped forward, and silently resumed his previous attitude and occupation; whilst Riquetti, who had cast but a passing glance at the man, and who attributed his surprise to the suddenness of their appearance, walked on, and thought no more of the matter.

It was drawing towards the afternoon, and our traveller had already spent some hours amongst the tombs, when, on emerging from one of them, he observed the same man sitting on the ground, near the entrance. He seemed to have wounded his foot, and was stanching the blood with a handkerchief. The guide approached him, and asked him what was the matter. "I hurt my foot yesterday," said he; "and being obliged to walk thus far to speak to old Guiseppe, the exercise has set it bleeding again," saying which he bound the handkerchief round his foot and arose. As he spoke, there was something in the voice and the play of the features that struck Riquetti as familiar to him; and that this approach to recognition was legible in his own face, was evident, for the man instantly frowned, and turned away his head. He, however, seemed inclined to join the party, or at least his way lay in the same direction; for he kept near them, lingering rather behind, as if his lameness impeded his activity. Presently, at a moment when the guide was a few yards in advance, and Riquetti between the two, he felt himself slightly touched upon the back, and on looking round he beheld the vine-dresser with the forefinger of one hand placed upon his lip, as if to enjoin silence, whilst in the other he held a piece of linen stained with blood, which he stretched out towards the traveller, shaking his head the while, and frowning in a manner that Riquetti was at a loss to understand, and which, as the injunction to silence was perfectly intelligible, he forbore to ask. His curiosity, however, being vividly awakened, and indeed his fears somewhat aroused, for he thought the gestures of the man seemed designed as a warning against some danger that awaited himself, he endeavoured to keep as near him as he could; whilst he kept his eye pretty constantly fixed upon his guide, whom he imagined must be the enemy he was admonished to distrust. He inquired who he was.

"That is Gasparo, the vine-dresser," was the answer.

Thus no doubt remained; but with the conviction that it was Gasparo came also the conviction that the warning had been well intended, and that the danger was real. But it was not easy to know what to do. He was two miles from the inn, in a lonely place, and the evening was drawing on; there was barely light enough to enable them to see their way back to the Isola Farnese. He saw nobody near him but his guide; but he had himself no weapon, whilst the other might be armed; besides, there might be enemies in ambush that he was not aware of. However, there was nothing to do but to return to the inn as fast as he could, and this he did, taking care to keep the guide in advance of him all the way; and to his surprise he arrived there without any alarm, or without perceiving any thing in the conduct of his companion that could have excited the slightest suspicion.

"Surely," thought he, "I must have mistaken Gasparo's intentions; he must have meant to intreat my silence with respect to himself; and the bloody cloth was for the purpose of recalling to my memory his wounds, and the circumstances under which we formerly met. He is probably, for some reason or other, afraid of being identified. This must be the true interpretation of his gestures. It would be absurd to suppose I can have any thing to fear amongst this virtuous unsophisticated people."

Comforted by this conviction, and resolved, in compliance with Gasparo's wishes, to ask no questions about him, Riquetti, having called for his supper and a bottle of wine, set himself with a good appetite to his fare. The first dish consisted of some fresh-water fish, of which he partook sparingly, reserving his appetite for the ragout, of whose merits the landlord had so confidently spoken. The odour it emitted when the cover was lifted appeared to confirm his predictions; the aroma was very savoury indeed.

"I think," said he to the host, who had placed the dish upon the table—and, as he spoke, he helped himself to an ample portion of the stew—"I think this ragout of yours seems worthy of a bottle of better wine. Have you any good Bordeaux or Florence?"

"I have no Bordeaux," answered the host, "but I have some good Florence in flasks, if you like that."

"Bring me some," said Riquetti, and the host left the room.

No sooner had the door closed upon him, than the movements of the surgeon would have extremely puzzled a spectator. Instead of conveying the savoury mess from his plate to his mouth, as might naturally have been expected, he conveyed it with inconceivable speed to his pocket-handkerchief, which, with equal celerity, he deposited in his pocket, so that, by the time the host returned, the plate was empty. "That is a capital ragout of yours—excellent, indeed!" said he, as he poured out a tumbler of the wine, and tossed it off. A suspicious eye might perhaps have observed that his cheeks and lips were blanched, and that his hand was unsteady; but the wine brought back the blood to his face, and the host perceived nothing extraordinary. The ragout being removed, some bread and cheese were next produced, of which he slightly partook, and then the table was cleared, and the host retired. As soon as he was gone, Riquetti, having set a chair against the door, to prevent his being too abruptly disturbed, took out his handkerchief, and very closely examined its contents, after which he restored the whole to his pocket, and began pacing the small room from end to end, with a countenance in which anxiety and apprehension were visibly depicted. He looked at the window, and appeared to be deliberating on the propriety of getting out of it. The thing was practicable enough; "but then," murmured he, "I could not find my way to Fossa; I should not know which way to turn;" for, as we have observed, it was yet but the early season of the year, and it had already been long dark. "Besides," added he, "who knows whether it would be safe to address myself to any one there, stranger as I am; it might be running from Scylla to Charybdis. Gasparo! Gasparo! where art thou?" These were but thoughts scarcely formed into words, and yet they seemed to be answered, for at that moment his attention was roused by two slight taps on the window. There was nothing before it but a calico curtain; this he drew aside, and then, on the taps being repeated, he gently lifted the sash.

"Go to your bed-room as soon as you can," said a hurried voice; "put out your light, and when you hear the signal, open your window, and, as quietly as you can, descend a ladder you'll find ready for you;" and the speaker, whom the light in the room showed to be Gasparo, turned quickly away, adding, "Shut down the window; be silent and cautious!" "Bravo, Gasparo!" whispered the surgeon to himself, as he obeyed his injunctions by closing the window and replacing the curtain—"Bravo! If you're a villain, you're a grateful one, at all events."

Having removed the chair from the door, and seated himself in an attitude of great ease and nonchalance, he drew a book from his pocket, which he placed before him, and then he rang the bell, and ordered some coffee; "and then," said he to the host, "I shall be glad to have my bed got ready, for I am tired with my day's work, and I mean to be off early in the morning."

The coffee was accordingly brought and drank, and then Riquetti requested to be shown to his bed-room, which proved to be a small apartment up one pair of stairs. As he expected, there was no fastening to the door of any sort; so having placed the dressing-table before it, and inspected the place all round, not forgetting to look under the bed, he took his portmanteau under his arm, put out his light, and with a beating heart sat down to await the promised signal.

He did not wait long. In less than half an hour, a few small pebbles, thrown against the window, summoned him to open it. He could not see the ladder, but he felt it, and stepping out, he carefully descended. As soon as his foot touched the ground, Gasparo, who was there to receive him, took him by the hand, and whispering, "Now, run for your life!" he dragged him forwards; and leading him up hill and down hill, across fields, over hedges and ditches, and through the water, without ever pausing to take breath or to utter a word, he at length, after some hours' flight, suddenly stopped, and Riquetti perceived that they were on the high road. "Now," said Gasparo, "you are within half an hour's walk of the city—you are safe—farewell, and God speed you! I have paid my debt!" And with that he turned, and walked hastily away; and though Riquetti called after him, and begged him to stay and speak to him for a moment, he never so much as turned his head, but departing as rapidly as he could, was soon out of sight.

The surgeon looked after him as long as he could see him, for it was now the dawn of day; and when he could see him no longer, having breathed a prayer for his preserver, with a grateful heart he took his way to Rome, where, before ever seeking the rest and refreshment he so much needed, he requested an interview with the chief officer of the police.

"I have," he said, "most important communications to make; but before I say a word, you must obtain for me a promise, that, whatever discoveries may ensue from my disclosures, the life of one individual shall be spared. He has saved mine, and I cannot endanger his."

This condition being acceded to by the government, Riquetti proceeded to detail his adventures, and to display the contents of his handkerchief; and the consequence of his communication was, that these innocent, virtuous, obliging, and unsophisticated vine-dressers and shepherds were proved, on investigation, to be leagued banditti, of whom the innkeeper was the chief. In the month of March 1839, no fewer than forty of them were brought to Rome and condemned to death or other punishments, according to the amount of crime proved against them. The worthy host, so celebrated for his excellent ragouts, expiated his enormities on the scaffold. Besides the evidence of the surgeon, many circumstances combined to show, that, when short of provisions, he had been in the habit of supplying the deficiency by compounding his dishes of human flesh. Riquetti's apprehensions had been awakened by recognising on his plate part of a hand, which circumstance

furnished the interpretation to Gasparo's warning gestures, and opened his eyes to the danger of his situation. These wretches admitted that they never attacked the English, as the investigations that would have been set on foot by their countrymen, had any of them been missing, would infallibly have led to a discovery of their iniquitous proceedings. It was some satisfaction to the surgeon that Gasparo was not found amongst the troop; he had not been seen at the Isola Farnese since the night they had fled together.

It appears wonderful that within so late a period, and within twelve or fourteen miles of a great city, such a villanous combination could have subsisted; in England, such a nest of scoundrels would be exposed and extirpated in a month.

DOG PERFORMANCES.

A SERIES of instances of the educability of animals, which appeared in a previous number of the Journal, has awakened the recollection of a friend respecting an exhibition that excited no small astonishment, and afforded great satisfaction to the admirers of canine sagacity.

About fifty years ago, a Frenchman brought to London from eighty to a hundred dogs, chiefly poodles, the remainder spaniels, but all nearly of the same size and of the smaller kind. On the education of these animals their proprietor had bestowed an immense deal of pains. From puppyhood upwards, they had been taught to walk on their hind legs, and maintain their footing with surprising ease in that unnatural position. They had likewise been drilled into the best possible behaviour towards each other; no snarling, barking, or indecorous conduct, took place when they were assembled in company. But what was most surprising of all, they were able to perform in various theatrical pieces of the character of pantomimes, representing various transactions in heroic and familiar life with wonderful fidelity. The object of their proprietor was, of course, to make money by their performances, which the public was accordingly invited to witness in one of the minor theatres.

Amongst their histrionic performances was the representation of a siege. On the rising of the curtain, there appeared three ranges of ramparts, one above the other, having salient angles and a moat, like a regularly constructed fortification. In the centre of the fortress arose a tower, on which a flag was flying; while in the distance behind appeared the buildings and steeples of a town. The ramparts were guarded by soldiers in uniform, each armed with a musket or sword, of an appropriate size. All these were dogs, and their duty was to defend the walls from an attacking party, consisting also of dogs, whose movements now commenced the operations of the siege. In the foreground of the stage were some rude buildings and irregular surfaces, from among which there issued a reconnoitring party; the chief, habited as an officer of rank, with great circumspection surveyed the fortification; and his sedate movements, and his consultations with the troops that accompanied him, implied that an attack was determined upon. But these consultations did not pass unobserved by the defenders of the garrison. The party was noticed by a sentinel, and fired upon; and this seemed to be the signal to call every man to his post at the embrasures.

Shortly after, the troops advanced to the escalade; but to cross the moat, and get at the bottom of the walls, it was necessary to bring up some species of pontoon, and accordingly several soldiers were seen engaged in pushing before them wicker-work scaffoldings, which moved on castors towards the fortifications. The drums beat to arms, and the fearful bustle of warfare opened in earnest. Smoke was poured out in volleys from shot-holes; the besieging forces pushed forward in masses, regardless of the fire; the moat was filled with the crowd; and amid much confusion and scrambling, scaling ladders were raised against the walls. Then was the grand tug of war. The leaders of the forlorn hope who first ascended, were opposed with great gallantry by the defenders; and this was perhaps the most interesting part of the exhibition. The chief of the assailants did wonders; he was seen now here, now there, animating his men, and was twice hurled, with ladder and followers, from the second gradation of ramparts; but he was invulnerable, and seemed to receive an accession of courage on every fresh repulse. The scene became of an exciting nature. The rattle of the miniature cannon, the roll of the drums, the sound of trumpets, and the heroism of the actors on both sides, imparted an idea of reality, that for the moment made the spectator forget that he was looking on a performance of dogs. Not a bark was heard in the struggle.

After numerous hairbreadth escapes, the chief surmounted the third line of fortifications, followed by his troops; the enemy's standard was hurled down, and the British flag hoisted in its place; the ramparts were manned by the conquerors; and the smoke cleared away—to the tune of "God Save the King."

It is impossible to convey a just idea of this performance, which altogether reflected great credit on its contriver, as also on the abilities of each individual dog. We must conclude, that the firing from the embrasures, and some other parts of the mechanique, were effected by human agency; but the actions of the dogs were clearly their own, and showed what could be effected with animals by dint of patient culture. By proficients in the military art, the performance was allowed to be as perfectly in conformity with the science of war as it was animated in appearance, and wonderful as an example of the intelligence of the lower animals.

Another specimen of these canine theatricals was quite a contrast to the bustle of the siege. The scene was an assembly room, on the sides and the farther end of which seats were placed; while a music gallery, and a profusion of chandeliers, gave a richness and truth to the general effect. Livery servants were in attendance on a few of the company, who entered and took their seats. Frequent knockings now occurred at the door, followed by the entrance of parties attired in the fashion of the period. These were, of course, the same individuals who had recently been in the deadly breach; but now all was tranquillity, elegance, and ease. Parties were formally introduced to each other with an appearance of the greatest decorum, though sometimes a young dog would show a slight disposition to break through restraint, but only to the increased amusement of the beholders. Some of the dogs that represented ladies, were dressed in silks, gauzes, laces, and gay, tasteful ribbons. Some wore artificial flowers, with the flowing ringlets of youth; others wore the powdered and pomatumed head-dress of riper years, with caps and lappets; in ludicrous contrast to the features of the animals. Doubtless, the whole had been the result of judicious study and correct arrangement, for the most animated were habited as the most youthful. The animals which represented gentlemen were judiciously equipped; some as youthful and others as aged beaux, regulated by their degrees of proficiency, since those most youthfully dressed were most attentive to the ladies. The frequent bow, and return of curtsy, produced great mirth in the audience; but when the noses of the animals neared each other, it produced a shriek of delight from the youthful spectators. On a sudden, the master of the ceremonies appeared. No doubt he was the chief in the battle fray. He was now an elegant fellow, full of animation; he wore a superb court-dress, and his manners were in agreement with his costume. He approached many of the visiters: to some of the gentlemen he gave merely a look of recognition; to the ladies he was generally attentive; to some he projected his paw familiarly; to others he bowed with respect; and introduced one to another with an air of elegance that surprised and delighted the spectators. There was a general feeling of astonishment at some of the nicer features of the scene, as at the various degrees of intimacy which individuals expressed by their nods and bows of recognition. Some considered the exhibition too much a burlesque of human life to be pleasing; but these were greatly outnumbered by those of a different opinion.

As the performance advanced, the interest increased. A little music was heard as from the gallery, but it was soon interrupted by a loud knocking, which announced the arrival of some important visiter, and expectation was raised; several livery-servants entered, and then a sedan-chair was borne in by appropriately dressed dogs; they removed the poles, raised the head, and opened the door of the sedan; forth came a lady, splendidly attired in spangled satin and jewels, and her head decorated with a plume of ostrich feathers! She made a great impression, and appeared as if conscious of her superior attraction; meanwhile, the chair was removed, the master of the ceremonies, in his court-dress, was in readiness to receive the *elegante*, the bow and curtsy were admirably interchanged, and an air of elegance pervaded the deportment of both.

The court of Lilliput was presented to the imaginations of many who witnessed the scene. It was well lighted; there was a diffusion of brilliancy and courtly splendour well calculated to heighten the illusion, and it was impossible to withhold expressions of gratification at the total surrender of all canine propensities on the part of the performers; they appeared absorbed in the execution of their various parts, and all they did was so far beyond expectation, that applause was loud and frequent. It is remarkable that the animals appeared not unconscious of the admiration which these plaudits expressed. The band now struck up an air of the kind to which ball-room companies are accustomed to promenade, and the company immediately quitted their seats and began to walk ceremoniously in pairs round the room. Three of the ladies placed their arms under those of their attendant gentlemen. On seats being resumed, the master of the ceremonies and the lady who came in the sedan-chair arose; he led her to the centre of the room; Foote's minuet struck up; the pair commenced the movements with an attention to time; they performed the crossings and turnings, the advancings, retreatings, and obeisances, during which there was a perfect silence, and they concluded amid thunders of applause.

There were other performances of a domestic nature, the simplicity of which was not so well adapted to the talents of these animals as seeking reputation in the cannon's mouth, or in the refinements of an assembly room. What ultimately became of the ingenious manager with his company, our informant never heard; in time his exhibitions were superseded by fresh novelties, and perhaps he returned to his own country, we hope with some tangible proof of John Bull's generosity.

NOTES OF A RESIDENCE IN THE BUSH.

BY A LADY.

INTRODUCTION.—GOING TO SETTLEMENT.

[THE wilds of Australia present at this time some strange scenes. Persons of all characters, and every variety of previous habits, are there planting themselves as sheep farmers, each family being generally placed in some rude hut in the centre of its "run" or sheep-walk, rarely at less than five miles' distance from another. Thus transferred all at once from parlour life in this country, perhaps from some learned or elegant profession, into a primeval solitude, and left to their own resources, a change of life and occupation is induced such as we have no experience of in civilised climes. Young men who once figured here in quadrille parties, are there seen driving cars and drays, or milking cows; while ladies, who once presided over a refined hospitality in some better part of a British city, are, in "the bush," fain to cook victuals for their husband and his shepherds. Occasional adventures with the savage aborigines streak the homeliness of the picture with something like the hues of romance. But all is not hardship and vexation. Labour and exposure in that country are attended with an excitement which prevents any thing like low spirits, and, joined to the fine climate, tend to keep up a tone of health which few in civilised life ever enjoy. Then there is no eye of fashionable neighbour to look pityingly or quizzingly on the mean details of the mud-house and the life which passes within it. Above all, the star of hope is present, instructing how to bear with the present for the sake of the future. It is readily to be supposed that a picture of this strange kind of life, drawn on the spot, must possess some interest, and such we have now to introduce to the notice of our readers. A married pair of our acquaintance, in the bloom of life, emigrated four years ago to Australia, taking with them their infant daughter, a shepherd, his wife, and a female servant. They were accompanied by two brothers of the lady, who were associated with the husband in his proposed new course of life. They were upwards of two years upon a "run" in the inland parts of the Port Philip settlement, where they realised, without mitigation of any kind, the whole hardships, difficulties, and troubles, and also the whole of the pleasures, of bush life. The lady lately returned to her native country, and has communicated to us a journal, in which we find a remarkably interesting account of this wild kind of existence. In presenting some portions of it to our readers, we only deem it necessary to remark, that the name is, for obvious reasons, fictitious; and that, from our recollections of the amiable writer, we could scarcely suppose any one of her sex less prepared by education and habits for bush life, than she must have been at the time when her husband emigrated.

The family arrived at Hobart Town in October 1838, and her husband and brother soon after proceeded to Port Philip, in order to secure a sheep walk. They obtained one which was considered of a highly advantageous nature, except that it was a hundred and twenty miles back from the settlement. Meanwhile, at a farm near Launceston, Mrs Thomson gained some insight into dairy management and other branches of rural economy. Having purchased at Launceston a dray and bullocks, also some horses, goats, pigs, geese, ducks, hens, rabbits, tubs, buckets, and a number of small tin utensils of various kinds, together with some flour and other provisions, they sailed for Port Philip, which they were eleven days in reaching. It is pleasant to hear of neighbourly kindnesses exercised in that remote part of the world. Mrs Thomson mentions that, at her departure from Launceston, she had presents of poultry from various persons; and one lady, whom she had only seen once, made her several large jars of preserves. While lying off George Town, a lady, hearing that one of her own sex with a young child was on board, sent her a box of eggs for the child—a very useful present. "I was fortunate," says Mrs T., "in meeting with kind friends wherever I went." It may here be mentioned, that Mrs T. left her female servant at Hobart Town, so that the only female now with her was the shepherd's wife.]

We landed [January 1839] at Point Henry, about eight miles from Corio, which is intended to be a town some future day. I did not go on shore the first day, as my husband, as soon as possible, got the mare and bullocks landed, which he took to Mr Fisher's station, near Geelong. The poor bullocks looked miserably thin, but the mare looked very well, and we were glad they were alive. It took a long time to land all the stock in the vessel. Some of the bullocks made a great noise, but no wonder; they were all down in the hold during the voyage, and when about to be

landed, a broad belt was passed round their body, and they were hoisted up high in the air by a pulley, so as to clear the vessel. They were then lowered into the water near a small boat, in which some men were waiting to catch the animal by the horns, and the others rowed quickly to shore, singing as they went. The poor sheep were not so troublesome; they were just thrown overboard, and allowed to make the best of their way to shore. While my husband was away with the large animals, I remained to look after the small stock. Next morning he came back to the vessel, and my brother James with him, also Mr Yuille, who had left home only a few months before us; but, indeed, I scarcely recognised him, he was such a strange figure. He had allowed his beard to grow to a great length; he wore very rough-looking clothes, and a broad black leather belt round his waist, with a brace of pistols stuck in it. I afterwards found out that the settlers pride themselves in dressing and looking as rough as possible. Our vessel could not get nearer the land than a quarter of a mile, consequently we went out in a small boat; but even in that we could not get near the shore, on account of the water being so shallow. I was carried out by my husband, and all our goods had to be brought ashore in the same way; but every one helped, and we seemed rather to like the *ploy*.

When landed, we looked like a party thrown on a desert island, the shore was so barren, and not a trace of human habitation to be seen, or any of the works of man. All was in a state of nature; and I kept looking round, expecting every moment to see some of the dreaded savages rushing upon us. I did not feel comfortable on account of the natives, I had heard such accounts of them in Van Diemen's Land.

When all our luggage and animals were landed, we began to pack our own, and Messrs Donald and Hamilton's dray; this took us a long time. The Messrs Baillie were also with us with their drays, so we made up a strong party. When all were ready to start, I got into a spring cart which Mr Thomson had borrowed from Mr Fisher for me; but indeed my share of it was very small. It was already so well filled that I could scarcely find a seat. Our shepherd's wife, who was no light weight, took up more than her share of the seat; she carried Agnes [the infant] on her knee. I took possession of the other seat. At my feet were four little dogs of Mr Baillie's, also three cats, some cocks and hens, and a pair of rabbits; at our back were three pigs, and some geese and ducks. We were a noisy party, for at times our road was very rough, and some of our animals were rather inclined to be quarrelsome. The spring cart went first, then came the five drays, and all the gentlemen walking alongside, with the dogs running beside them. Most of the gentlemen had either pistols at their sides or a gun in their hands. Little Nanny followed behind, accompanied by old Billy, who had a wonderfully long beard. The country seemed very scrubby and barren, and the trees so dark and ugly, that I was disappointed in the appearance of them. I expected to see beautiful large trees, but I saw none to compare with the trees of my own country. My husband told me to have patience till I went further up the country; but, after being three years in it, I am still of the same opinion.

We got to Mrs Fisher's about seven o'clock; she received us very cordially. We found tea awaiting us, and I there tasted *damper* for the first time. I liked it very much; it is like bread, but closer and heavier. I said to Mrs Fisher that she must think we had taken a great liberty in coming in such force upon her; but she did not at all seem to think so. She said she was quite accustomed to have many gentlemen visiters, but she never had had a lady before. I could not at all fancy how she would manage in regard to giving us beds; however, she soon disposed of us very easily. A bed was made up for me, little Agnes and her maid, on the parlour floor, and all the gentlemen were sent to the wool-shed, to sleep as they best could: fifteen slept in it that night. A few of them had blankets or rugs, but most of them had nothing.

In the morning, I asked my husband how he had slept; he said, never better. We remained a week here. Next day we saw some of the natives; they are very ugly and dirty. Some of them wore skins sewed together and thrown over their shoulders; a few had some old clothes given them by the settlers; and some were naked. They kept peeping in at the windows to see us, and were always hanging about the huts. Mrs Fisher called them *civilised* natives, and said they were always about the place. One day I went out to walk with little Agnes in the bush. I was keeping a good look-out for snakes, and was just stepping over what I fancied, by a slight glance, to be a burnt log of wood, but a second look showed me my mistake; it was a native lying on the grass, grinning in my face with his large white teeth. I was rather afraid, but he looked very good-tempered, and laughed. He seemed too lazy to move, so I gave him a nod, and walked on, well pleased he did not think it necessary to accompany me home. My servant Mary was very much afraid of the natives. She would scarcely move out of the hut, and was always crying and wishing herself at home. She said she was determined to make her husband send her home with the first money he made. She wondered why I did not think as she did. She would take comfort from no one, and was quite sure she would be killed by the wild natives when she got up the country.

The township of Geelong consisted of three buildings, all of them stores, where every thing was sold at a most extravagant profit. On Sunday, we went to church in Mr Fisher's wool-shed, and had a sermon from a Wesleyan missionary. His wife commenced the psalm tunes.

We had fixed to begin our journey up the country, and the gentlemen had gone to Geelong to load the drays. I waited for them in Mr Fisher's hut, when in a moment it got quite dark, and the wind roared most tremendously. It was the most awful sight I ever witnessed; we were afraid to move. The storm passed over in about ten minutes, but many a tree had been torn up by the roots during that time. When the gentlemen came with the drays, they were so covered with dust, that I could scarcely tell one from the other. Some of them had been knocked down by the tornado, and one of the drays blown over. It was now too late for us to begin our journey, so we remained another night at Mr Fisher's, and started early in the morning. On this occasion, we had much difficulty in getting the horses to start; they were ill broken in, and many times they stopped on the road, so that we had often to take some of the bullocks out of the other drays to pull them on again. We travelled the first day thirty miles, quartering for the night at Mr Sutherland's hut, which he kindly gave up for our accommodation. Next day we had to rest the bullocks, so we walked over to Mr Russell's station, about three miles distant, and remained there a night. In the evening we went to see a meeting of the natives, or a *corobery*, as they call it. About a hundred natives were assembled. They had about twenty large fires lighted, around which were seated the women and children. The men had painted themselves, according to their own fancy, with red and white earth. They had bones, and bits of stones, and emu's feathers, tied on their hair, and branches of trees tied on their ankles, which made a rushing noise when they danced. Their appearance was very wild, and, when they danced, their gestures and attitudes were equally so. One old man stood before the dancers, and kept repeating some words very fast in a kind of time, whilst he beat together two sticks. The women never dance; their employment is to keep the fires burning bright, and some of them were beating sticks, and declaiming in concert with the old man. The natives, when done with their corobery, were very anxious that we white people would show them how we coroberied; so we persuaded Mr Yuille to dance for them, which he did, and also recited a piece of poetry, using a great many gestures. The natives watched him most attentively, and seemed highly pleased. After giving the natives some white money, and bidding them good night, we returned to Mr Russell's hut.

Next morning our bullocks were lost—a very common occurrence, it being impossible to tie them, as in that case they would not feed; and unless one has a very good bullock-driver who will watch them, it generally takes several hours to find them in the morning. Numbers of natives came this forenoon to see us; they examined my dress very attentively, and asked the name of every thing, which they tried to repeat after me. They were much amused with my little Agnes, and she was as much pleased with them. I wondered what her grandmamma would have thought, could she have seen her in the midst of a group of savages, and the life of the party. Whenever Agnes spoke, they all laughed loud, and tried to imitate her voice; and the *pickininny lubra's* dress was well examined. I put a little nightcap on a native baby, with which its mother was much pleased, and many a little black head was thrust out for one also.

I now began to be a little disgusted and astonished at the dirty and uncomfortable way in which the settlers lived. They seemed quite at the mercy of their hut-keepers, eating what was placed before them, out of dirty tin plates, and using a knife and fork *if* one could be found. Sometimes the hut-keepers would cook the mutton in no way but as chops; some of them would only boil it, and some roast it, just as they liked; and although the masters were constantly complaining of the sameness, still it never seemed to enter their heads to make their servants change the manner of cooking; but the truth was, they were afraid to speak, in case the hut-keeper would be offended and run away. The principal drink of the settlers is tea, which they take at every meal, and indeed all the day. In many huts the tea-pot is always at the fire; and if a stranger comes in, the first thing he does is to help himself to a panikin of tea. We had neither milk nor butter at any station we were at; nothing but mutton, tea, and damper, three times a-day; every meal was alike from one week to another, and from year's end to year's end. I was so sick of it, I could scarcely eat any thing.

Next day, we had our bullocks ready in good time, as we had a long journey before us; at least we hoped to get on a good way. The heat this day was very intense, and we had no shade. I could scarcely bear it; and before evening we had drunk all the water we brought with us. I thought I should have died of thirst; and we were all suffering alike. Poor little Agnes cried much; at last we got her to sleep and forget her wants. My husband was driving one of the drays, and was so thirsty, that when we came to a muddy hole of water on the path, which the dray had passed through, he lay down on the ground and drank heartily. One of our party, who knew some thing of the roads, told us we were near water holes, which raised our spirits. At last we came to them, and both people and animals took many a long drink, although the water was bad, and quite bitter from the reeds which grew in it. We filled our cask, and continued our journey a few miles farther, to a place where we were to sleep in the bush. When we got out of the dray, one of the little kittens could not be seen; but on a nearer inspection, it was found squeezed flat on the seat where our servant Mary had sat; it looked as if it had gone through a mangle. Poor Mary was much distressed and annoyed by the gentlemen telling her she must be an awful weight.

We had soon lighted a fire at the foot of a tree, and put on a huge pot of water to boil; when it did boil, two or three handfuls of tea were put into it, and some sugar. One of the men made some thick cakes of flour and water, and fried them in grease. We had also some chops cooked, which we all enjoyed, as we had not stopped to eat any thing on the road. The tea was not poured out; every one dipped his panikin into the pot and helped himself. Mary, Agnes, and I, had a bed made with some blankets under the dray, and all the others slept round the fire, taking by turn the duty of watching the bullocks. Before going to rest, the bullock-driver made a large damper, which he fired in the ashes, for our provision next day.

We got up at day-break, had breakfast, and went on again, and travelled through a forest on fire for forty miles. I was often afraid the burning trees would fall upon us; and we had sometimes to make a new path for ourselves, from the old tracks being blocked up by fallen timber. The fires in the bush are often the work of the natives, to frighten away the white men; and sometimes of the shepherds, to make the grass sprout afresh. A conflagration not unfrequently happens from some one shaking out a tobacco pipe (for every one smokes); and at this season the grass is so dry that it soon catches fire.

We rested for two hours and cooked some dinner, chiefly that our bullocks might feed and rest during the heat of the day. Mr Yuille and I made some fritters of flour and water; I thought them the best things I had ever ate. The Scotch clergyman from Melbourne passed us on the road; he rebuked our bullock-driver for swearing at his bullocks; but the man told him that no one ever yet drove bullocks without swearing; it was the only way to make them go. We lost a very fine kangaroo dog by one of the drays falling back upon it.

This night we slept at Mr Anderson's hut; he was from home, but had an old woman as hut-keeper, who made us as comfortable as she could; but it was a cold night, and the wind whistled very keenly through a door made of rushes. This was one of the most neatly kept huts I saw, and the owner of it one of the few gentlemen who kept himself always neat and clean in the bush.

Next day we went over to Mr Yuille's station, where I remained six weeks, until our own hut was put up; the gentlemen kindly gave up their sleeping apartment to me. While at Mr Yuille's station, I gathered a great many mushrooms, the finest I ever saw. I had fortunately a bundle of spices in my trunk, and I made a good supply of ketchup, both for Mr Yuille, and to take to our own station.

I felt distressed to see so much waste and extravagance amongst the servants. Many a large piece of mutton I have seen thrown from the hut door that might have served a large family for dinner; and unfortunately there is no remedy for this: if the masters were to take notice of it, it would only make them worse, or else they would run away, or, as they call it, *bolt*. I saw plainly that there would be neither comfort nor economy to the masters so long as the country was so ill provided with servants; *they* were the masters; they had the impudence always to keep in their own hut the best pieces of the meat, and send into their masters the inferior bits. I was sorry my servant Mary should have so bad an example, but hoped that she had too much good sense to follow it, as she appeared as much shocked at it as myself.

I was glad when my husband came to take us to our own station, which was about thirty miles farther up the country. Part of the country we passed through was the most beautiful I ever saw, while other portions were very cold and bleak. We stopped at one or two huts, and had mutton, tea, and damper, at each of them. We passed an immense salt lake, which is gradually drying up; its circumference is forty miles. Many lakes, both salt and fresh, have dried up lately. The natives say it is the white people coming that drives away the water; they say, "Plenty mobeek long time, combarley white fellow mobeek gigot"—in English, "Plenty water for a long time, but when the white people come, the water goes away." The natives have some strange ideas of death; they think, when they die, they go to Van Diemen's Land, and come back white fellows. I know a young man who receives many a maternal embrace from an old black woman. She fancies he is her son, who died some time before; she saw him come back, and she calls him always by her son's name. They also believe in a good and evil spirit, and that fire will keep away the bad spirit; consequently, at night, when urgent business prompts them to move about, they always carry a fire-stick; but they do not like moving in the dark.

When we passed the salt lake, the country began to improve. I thought we should never come to our

own station, the bullocks travel so very slowly. At last Mr Thomson told me to look forward as far as I could see; we were now at the end of a large plain or marsh. I looked, and saw our pretty little hut peeping through a cluster of trees. I cannot say how it was, but my heart beat with delight the first time I saw that place. I took it for a presentiment of good fortune; and Mary, who had now got over her fear of the natives, seemed to participate in my feelings, for she said, "It's a bonny place, and my heart warms to it."

MRS LOUDON'S YEAR BOOK OF NATURAL HISTORY.*

It must be agreeable to many parents to know, that Mrs Loudon has begun to apply her excellent talents and extensive knowledge of natural history to the service of the young. This volume is the first present she has made to the juvenile world, and it is a very delightful one. Its structure is simple, consisting merely of conversations between herself (under the name of Mrs Merton) and her own daughter Agnes, though the scene of the dialogue is often shifted, and one or two friends are admitted occasionally, as interlocutors. It is beautifully embellished with wood-engravings, and altogether is one of the best books of its class which we have happened to see. A few bits, taken here and there from its pages, will justify our opinion, and perhaps lead some of our young readers to form a more intimate acquaintance with it.

On some British field birds.—"'Now we are talking about birds, mamma; do you remember, when we were in the country last summer, our finding a nest in some reeds that grew near a brook, with the little birds that had crept out of it, clinging with their claws to the reeds, while their parents were feeding them?'

'Yes. These little birds were reed warblers, or, as they are sometimes called, reed wrens (*Sylvia arundinacea*), and it is a peculiarity in that species for the young birds to leave the nest before they can fly. The nest of the reed warbler is very deep, to enable it to retain the eggs, when the reeds on which it is fixed are blown about by the wind; and the poor little birds would be almost smothered, if they did not contrive to crawl out. It is very curious to see the female bird sitting on her eggs with the most perfect confidence, while the reeds which form its support are tossed to and fro by the wind, and sometimes blown down to the level of the water. The nest is very curiously contrived, being formed of moss and dry grass, neatly and very strongly interwoven, like basket-work, round the reeds; and where practicable, round the branch of some neighbouring poplar or willow, as if the bird knew that, by fastening its nest in this manner to a tree, it would be rendered more steady.'

'Can't you tell me any more about it, mamma?

'I can tell you something of another bird that very closely resembles it in appearance and its place of living. This is the sedge warbler (*Sylvia phragenites*), a bird so remarkable for its song, that it has been called the English mocking-bird.'

'What is meant by a mocking-bird?'

'A bird that can hardly be said to have any note of its own, but which imitates every bird it hears. I can tell you a curious tale that I have heard of one of these sedge warblers. A young man, whom I shall call George, a native of Northumberland, happened to be staying with some friends near Stanmore, and having boasted of his skill in catching birds, the young lady of the house asked him to get her a linnet. A few days afterwards, George, while walking with the son of his host, whom I shall call Edward, heard a sedge warbler imitating a linnet. He was delighted, and hastened forward to catch the bird; but before he reached it, the mocking-bird had changed its song to an imitation of the swallow's chatter of self-satisfaction, when one of those birds has been building a nest in a barn. George was rather puzzled, and stood still; but in a few moments, hearing the triumphant *wee-wee-wee*, with which the linnet generally concludes its song, he darted forward and caught at the bird, which, to the great amazement of Edward, flew away, uttering *churr-churr*, and prolonging the sound of the *r*, in which the Northumbrians are so very deficient, as if in ridicule of its enemy.'

'How droll!'

'In this manner the sedge warbler will imitate the songs of perhaps a dozen birds in succession; running from one to another in a gay and lively manner, as though it enjoyed its mimicry; and changing perpetually, as though from caprice.'

They had now returned to the house; and they were ascending the steps which led to the terrace under the veranda, when they saw a robin redbreast hopping along the flags. He did not fly away when he saw them, but turned his little head on one side with such a curious mixture of pertness and simplicity in his bright black eyes, as he looked up in their faces, that he quite delighted Agnes.

'What a little dear he is,' cried she; 'I do really think he would almost let me stroke him.'

'There are some people,' said Mrs Merton, 'who assert, that the tameness and sociability of the robin should be attributed to boldness: but there is something so agreeable and confiding in the habits of this bird that I never could bring myself to think ill of it. Bobby does, it is true, look rather saucily up in one's face, as though he defied us to do him any harm; and people do say that he is terribly given to fighting with other birds of his own kind.'

'Oh, I'm sorry to hear that!'

'A gentleman, wanting to entrap a wild robin, placed a tame robin in a cage, tying it to the bars by its leg. The cage was then placed with the door open on the ledge of a balcony, and only a few minutes elapsed before a wild robin, attracted by the fluttering of the captive, approached the cage, and hopped round it several times, uttering a fierce note of defiance. The imprisoned robin ceased its fluttering, and answered this note with another of the same kind; when the stranger rushed into the cage, and so furious a combat took place between the two birds, that the stranger robin permitted the gentleman to close the door of the cage, and remove it into his room, where he took the two little furies out in his hand, and put them into separate cages.

'I am quite shocked to hear such an account of any robin. But perhaps that happened to be a very quarrelsome bird: you know there are some quarrelsome men.'

'I am sorry to say that the fact of the robin's pugnacity does not rest upon this solitary instance. A friend of mine in Wales had an arbour in his garden, where he and his family were frequently in the habit of taking tea; and whenever they did so, a robin redbreast was sure to perch upon the table, to peck whatever crumbs might be left. The children were very fond of this bird; and it, at last, became so tame, that it would perch on the shoulder of one of them, a little girl of about your age; and when it saw her coming into the arbour, it would hop up the gravel-walk to meet her. This continued several weeks, till one day the gardener caught another robin, which was put into a cage, and hung up in the arbour to see what the children's Bobby would say to it.'

'Well, and what happened?'

'I am quite sorry to tell it. The moment the tame Bobby discovered his rival in the cage, he flew at it with the greatest fury, beating himself against the bars with such violence that he fell down evidently much hurt. The little girl whom he was so fond of, picked him up in her hand, and endeavoured to tempt him to eat, but he would not touch any thing. He was evidently pining with rage and jealousy; and she no sooner let him go than he again flew furiously against the cage, and beat himself against the bars so violently, that in a very short time he fell down dead.'

'And what did the other bird do?'

'He fought as furiously as he could inside the cage; and after Bobby was dead, he pecked so violently at the bars to get through them, that it is supposed he hurt himself also; for he would not eat any of the food that was brought to him, and he died in a few days.'

'What a melancholy history!'

'It is a fearful example of the effects of ungoverned passion, even in a bird.'

Eliza now brought some crumbs of bread and small bits of meat for Agnes to give the robin; and the little girl strewed them on the flag-stones under the veranda, Bobby sitting all the time on a vase close by, and eyeing her proceedings.

'Why does he not fly down, and begin to eat?' cried Agnes, after waiting some time. 'See how he keeps bowing and quivering his tail. Perhaps he is afraid of me;' and the little girl crept close to her mother, as far as possible from the place where the crumbs were.

'I think he is afraid of the cat,' said Mrs Merton; 'and that his bowing is not intended to thank you, but to intimate that he wishes to decline the honour of Sandy's acquaintance.'

Agnes looked round, and saw Sandy sitting behind them, as intently watching the bird as Bobby himself had watched the crumbs of bread. 'Oh, do take Sandy away!' cried she to Eliza.

'I am sure, Miss Agnes,' said Eliza, 'Sandy would never think of touching a robin.' And apparently hurt at the imputation thrown upon her favourite, she called the cat away. Bobby only waited till they were out of sight, before he flew down to his crumbs; and while he was eating them, Agnes asked her mother why Eliza had appeared so indignant at its being supposed that her favourite Sandy would kill a robin.

'There are several strange superstitions respecting the robin current in different parts of the country,' said Mrs Merton, 'that I believe have never been satisfactorily accounted for. For instance, in the county that Eliza comes from, any cat that was detected killing a robin, would be supposed to be a witch in disguise, and would immediately be hanged or drowned without mercy. When I was a child, I have often heard that a cat would never eat a robin, even if it had killed it; and I am sure no boy in the village, however wild or mischievous he might be, would have killed either a robin or a wren.'

'And is no reason known for this?'

'None that ever I heard of, except the fable of two robin redbreasts covering the Children in the Wood with leaves after their death: and the old distich, 'The robin and the wren are God's cock and hen.''

'I am glad that any feeling prevails to save robins: they are such pretty creatures, in spite of their faults. Do they sing sweetly, mamma?'

'The song of the robin is very different at different seasons; in the spring, it is cheerful and mellow; in autumn, it becomes more melancholy, and often stops abruptly; and in winter, it is only a kind of chirp. It has been observed that in summer, after rainy and unsettled weather, if a robin is heard to sing loudly and cheerfully, and to continue his song for a long time, the following day is generally the commencement of a long series of fine and sunny days; and on the contrary, if in dry warm weather the robin be observed to perch low in a hedge, and to sit brooding and chirping mournfully, wet and gloomy weather is sure to be near at hand.

'I wish Bobby would begin to sing now.'

'Robins seldom sing in very cold weather; but I certainly think he might chirp, to thank you for his dinner.'

'Did you ever see the nest of a robin, mamma?'

'Yes; and I know of no other bird that will build in such strange places. When it makes its nest in the open air, it is constructed of moss, dry grass, and dead leaves; and it is generally placed on a bank sheltered by a low hedge, or a thick bush, or in a hole in a wall, covered with ivy. As to the strange places in which it builds sometimes, a pair near Manchester built in a saw-pit, where the female sat and hatched her young, though two men were sawing timber in the pit every day close to her. Another pair built under the horse in a child's cart, which had been hung up against the wall in a lumber room; another in the folds of a curtain; and another under a large Bible in the pulpit of a church. But the strangest of all, was what happened to a friend of ours in Ireland.'

'And what was that, mamma?'

'Our friend had a museum of stuffed birds and beasts, to which it was necessary to admit the air every day; and he was very much annoyed to find, that every time the window was opened, a pair of robins flew into the room, and all about it, as if they were looking for a place to build a nest. The robins were repeatedly driven out; but as they returned as repeatedly, and as our friend could not spare the time to stay all day to watch them, he removed some of the most fearful-looking creatures in his museum to the window, hoping to frighten the robins away. For this purpose he placed an alligator, with open jaws, and frightful rows of teeth, on one side, and an equally terrific-looking shark on the other, while in the middle stared a very fierce-looking tiger. When our friend had completed his barricade, he could not help looking with some satisfaction at his work. The robins will fancy these creatures alive, thought he, and it must be a bold bird indeed that will venture to pass by them. Thus satisfied, our friend left the room with the window open, and did not return to it for several days, and when he did, what do you think he saw? The female robin's bright eyes peeping at him through the spaces between the alligator's teeth; for she had built her nest in the fearful creature's mouth. Our friend, though very much provoked, could not help laughing; and he was so amused with the ingenious manner in which the robin had contrived to obtain her end, that he suffered her to hatch her eggs and rear her young, without attempting to disturb her.'"

* The Year Book of Natural History for Young Persons. By Mrs Loudon. John Murray, Albemarle Street. 1842. Small square 8vo., pp. 264.

JUVENILE LABOUR.

There is much truth in the following observations on the employment of young persons in factories. We quote from an article on the manufacturing population in a new periodical, to which we wish every success—"The North of England Magazine" (Manchester: Simms and Dinham):—

"'Juvenile labour is a grievance;' we confess it, but there is one thing worse, and that is juvenile starvation. We have seen with some pain the little piecers and cleaners employed in their monotonous routine, when the sun was high in heaven, when the skies looked smilingly upon the earth, and earth answered with its own smile of loveliness and fertility; we thought how much more delightful would have been the gambol of the free limbs on the hill side, the inhaling of the fresh breeze, the sight of the green mead, with its spangles of butter-cups and daisies, the song of the bird, and the humming of the bee. We could give as much sentimentality on the subject as would serve three generations of boarding-schools. But we have seen other sights; we have seen children perishing from sheer hunger in the mud hovel, or in the ditch by the wayside, where a few sods and withered boughs had formed a hut, compared to which a human wigwam were a palace. We have seen the juvenile mendicant, and the juvenile vagrant, with famine in their cheeks and despair in their hearts; we have seen the juvenile delinquent, his conscience seared by misery, his moral nature destroyed by suffering, his intellectual powers trained to perversity by the irresistible force of the circumstances that surrounded him. It is a sad confession to make, but, owing perhaps to some peculiar obliquity of intellect or hardness of heart, we would rather see boys and girls earning the means of support in the mill than starving by the roadside, shivering on the pavement, or even conveyed in an omnibus to Bridewell.

Most worshipful and compassionate philanthropists, to whom such a declaration will probably appear the very consummation of cruelty, and perhaps of iniquity, we pray of you to reflect upon the simple words, 'earning the means of their support.' It is a physiological fact, of which you probably are not aware, that these young people have mouths and stomachs; it is absolutely true that they require to be fed as well as your lap-dogs and fox-hounds. It is probable, also, that they may require some few articles of clothing, if not for the sake of keeping them warm at least for the protection of delicate nerves; complete nakedness might shock fastidious people. Far be it from us to blame your sympathies for the over-worked children, we only ask you to extend some share of such honourable feelings to their more miserable parents.

The question of juvenile labour is one that concerns the parents infinitely more than the employers of the children. Manufacturers have not created the system; it has been forced upon them. There never was such a thing as a levying of children by conscription for the service of the mill-owners; there is not one recorded instance of a piecer or cleaner being kidnapped in Manchester by any wholesale dealer in human flesh; negroes have been stolen and purchased to cultivate the estates bequeathed to religious societies in the West Indies, but no such system has ever been adopted in recruiting for the factories. The children are sent to work with the full knowledge and approbation of their parents. It may be said,

'Their poverty and not their will consents;'

and when this is said, we have got to the very pith and marrow of the question. The operative labours to procure food for himself and his family; if his toil does not bring in a sufficiency for their maintenance, the other branches of the family must give additional labour, in order to increase the common stock, or they must starve. It is sufficiently easy to join in the senseless howl against philosophy and political economy, but there is no getting over the plain fact, that neither man nor boy, woman nor girl, can eat, unless they have food. * * *

Every body has laughed at the French princess, who,

hearing that the poor had an insufficiency of bread, proposed to feed them with plum-cake; but her proposition was absolute wisdom, when compared with the schemes broached by the humanity-mongers of the present day. They tell us to abolish juvenile labour; they reflect not that labour brings wages, and that wages bring bread; their charity is starvation; their humanity a sentence of extermination.

It is offensive to fine sensibilities that children should work at factories, but is it equally offensive to such delicate feelings that these children should be in existence? There they are, and fed they must be. The mode is to be settled, not with the manufacturer, but with the father and mother. We should gladly see our precious philanthropists setting about it. Suppose one of these humanity-mongers going into the cottage or lodging of a working family, and gravely proposing that the boys and girls should be prevented from going to the mill for the future. The father declares, that already their united wages are barely sufficient for decent support, and that, in the present state of trade, a reduction of wages is far more probable than a rise. If he could procure food at a cheaper rate, if taxation did not indirectly sweep away more than half of his earnings, he might be able to afford his children more leisure for instruction and amusement; but to propose as a remedy for a poor man's sufferings the increase of his outgoings, accompanied by the diminution of his incomings, is sheer mockery and insult on the part of a man in his senses, and worse than the drivellings of idiocy when proposed by anybody else."

ANATOMICAL STUDY.

Persons who imagine that medical men might be sufficiently instructed for all useful purposes without a knowledge of anatomy gained in the dissecting room, will perceive the fallacy of such an opinion on perusal of the following passages from a lecture by Dr M. S. Buchanan, lately delivered to the students of Anderson's University, Glasgow:—

"I shall shortly state the case of a man of the name of Stewart, who was admitted into our infirmary on the 19th of April, 1830. While superintending some boiling solution at the Hurlet Alum-works, he had fallen by the side of the vat, by which his arm had been so destroyed, that, shortly after his admission, notwithstanding all the means which were adopted to arrest the progress of the mortification, amputation of the arm, immediately below the shoulder-joint, was obliged to be had recourse to. The operation was ably performed by my friend Dr Weir; and though the wound was in a sloughy condition for some days after, still, when I took the charge (according to the regulations of the house), on the 30th of April, there was no cause for serious alarm. On the morning of the 1st of May, however, profuse arterial hemorrhage took place from the surface of the stump; and after consultation, it was unanimously decided that I should place a ligature on the subclavian artery above the clavicle, on the distal side of the *scalenus anticus* muscle. The operation did not occupy more than ten minutes—scarcely a table-spoonful of blood was lost during its performance—and I may add, that the patient was by this means secured from further hemorrhage.

Now, this was an operation which I was almost daily in the habit of performing in the dissecting room, and in consequence, knew well the relative position of the parts; but in the case narrated, I experienced that it is one thing to perform an operation on the dead, and a very different matter to handle the knife on the living subject; more especially where inflammation had been present, where mortification and suppuration had caused so much displacement: and, above all, where the movements of the patient exposed him, at every step of my progress, to fresh hemorrhage; but, gentlemen, if such were my feelings with all my previous knowledge of the parts, what would they have been had I been groping in the dark? And so you will all soon find, that, unless your eye and hand are accustomed to trace accurately the connexions and relations of such parts on the dead, you will never be able to operate with confidence or success on the living. Some of you may say, however, 'Oh! we shall never need to perform any such dangerous or difficult operation as that now adverted to, as we do not intend to become hospital surgeons.' But how do you know at present what situations in life you may be called on to occupy? You go to the Highlands of your own country, to India, or to Canada, it may be, and how do you know but that, on your very first entrance on practice, as happened to myself in the case alluded to—for it was my very first hospital operation—some poor unfortunate may get himself injured in the thigh or arm, and bleed so profusely that no time may be left you for consultation. You apply your tourniquet, but this fails to arrest the arterial current; you try compression and stiptics of various kinds, but all will not do; and sad must be your state of mind, if, in such a case, from ignorance of anatomy, you allow a valuable life to be lost; and blasted for ever must be your professional reputation, if you do not by ligature arrest the progress of that hemorrhage, an operation which a knowledge of anatomy alone can enable you to accomplish.

How frequently is it the case, that the student of divinity is obliged to labour either in remote parts of his own country, or, as a missionary, is called on to migrate to foreign climes, where, besides unfurling the banner of the cross, and prosecuting his godlike labours, he may give medical advice, and thus many a valuable life may be saved. Indeed, so indispensable do I think a knowledge of anatomy to the divine, that, instead of enforcing an attendance on natural history, as is now the case, the time, I sincerely trust, is at hand when anatomy will take its place; and nothing will afford me more satisfaction than in affording every facility in my power to accomplish so very desirable an object.

To lawyers of every grade, how necessary and important is a knowledge of anatomy, all of you must have remarked who have ever been present at a coroner's inquest in either of the sister kingdoms (for no such court, to the disgrace of Scotland, exists in our own country), and in our justiciary courts; more especially in all cases of murder or homicide how superior does the advocate appear, who, having a knowledge of this important science, elicits all that information so necessary to the elucidation of his case, and so important to the life of his client! To every reflecting mind, indeed, the wonderful mechanism of the human body must ever be a subject of the most interesting contemplation. What curiosity can be more natural, what can more nearly concern us, than to be intimately acquainted with that framework which is the organ of mind, the instrument by which it acquires all its ideas, which it employs in all its operations, and on the order or derangement of which so much of our happiness depends? To those among you—and I hope there are not a few who take pleasure in contemplating the Deity in his works—what study can be more gratifying and pleasing than the investigation of the structure and functions of the animal machine, which everywhere exhibits so many proofs of divine wisdom and benevolence? So convinced, indeed, have been the virtuous and talented in all ages of the aid which natural theology derives from anatomy, that this has been of all arguments the most convincing in proof of the power, wisdom, and goodness of the Almighty; and has produced, of late years, one of the most able of the Bridgewater treatises on this interesting theme—I allude to that one by Sir Charles Bell, on the Structure and Functions of the Hand of Man—a fractional part only of that wonderful machine which we are about to contemplate."

THE DULCIMER.

A short time ago, the Edinburgh public was delighted with the music of a rare and ancient species of instrument, the dulcimer. Two brothers, Messrs Nelson, were performers, each playing on an instrument placed before him, and the charming sounds they produced were not less gratifying than the extraordinary dexterity of their execution. A newspaper, *The Observer*, describes the dulcimer as follows:—"It consists of a flat box about three feet long, nearly the same in breadth, and four inches in depth; and in shape it somewhat resembles the cushion of an ordinary chair, the front, or side next the performer, being wider than the opposite or farther side. The top or *belly* of the instrument is of thin wood, perforated with two sounding holes. On the belly, and respectively parallel to the ends of the instrument, there are fixed two rows of wooden pins, about a dozen in each row, each pin being about two inches high, with a space of about half an inch between every two. Each row stands about one-third of the whole length of the instrument from its contiguous end, the two rows thus dividing the belly into three compartments. These pins being bevelled, or brought to an edge at the top, serve as bridges to elevate and support the strings. The strings are of thin metallic wire, four to each note, tuned, of course, to the same pitch. The wires are fastened at one end of the instrument by means of small brass jaggs, and at the other by iron pegs, which can be turned round by a key to tune the instrument, as is done in the pianoforte. Although there are two rows of bridges, the strings composing one note do not pass over two pins, for the pins are so placed, that one stands opposite the space between two on the other side, thus giving room to the strings upon it to run, without interruption, the whole length of the instrument from the bridge to the opposite end. By this arrangement, the several notes present a surface of alternate elevations and depressions similar to the appearance of the warp threads in a loom, when moved by the treadles to receive the woof. The compass of the instrument extends to two octaves and a half, tuned in the chromatic scale. When played upon, it is placed on a table, and is slightly inclined to face the performer, who sits opposite to it, and beats upon it with both hands by means of slight slips of cane, about six inches long, and curved at one end. The strings are struck with the curved end, which is muffled by a thread being twisted round it. The Messrs Nelson play on two instruments, the one playing the subject, and the other the accompaniment."

PUNISHMENT OF DRUNKARDS.

The laws against intoxication are enforced with great rigour in Sweden. Whoever is seen drunk is fined, for the first offence, three dollars; for the second, six; for the third and fourth, a still larger sum, and is also deprived of the right of voting at elections, and of being appointed a representative. He is, besides, publicly exposed in the parish church on the following Sunday. If the same individual is found committing a like offence a fifth time, he is shut up in a house of correction, and condemned to six months' hard labour; and if he is again guilty, to a twelvemonth's punishment of a similar description. If the offence has been committed in public, such as at a fair, an auction, &c., the fine is doubled; and if the offender has made his appearance in a church, the punishment is still more severe. Whoever is convicted of having induced another to intoxicate himself, is fined three dollars, which sum is doubled if the drunken person is a minor. An ecclesiastic who falls into this offence loses his benefice; if it is a layman who occupies any considerable post, his functions are suspended, and perhaps he is dismissed. Drunkenness is never admitted as an excuse for any crime; and whoever dies while drunk, is buried ignominiously, and deprived of the prayers of the church. It is forbidden to give, and more explicitly to sell, any spirituous liquor to students, workmen, servants, apprentices, and private soldiers. Whoever is observed drunk in the streets, or making a noise in a tavern, is sure to be taken to prison, and detained until sober, without, however, being on that account exempted from the fines. Half of these fines go to the informers (who are generally police officers), the other half to the poor. If the delinquent has no money, he is kept in prison until some one pays for him, or until he has worked out his enlargement. Twice a-year these ordinances are read aloud from the pulpit by the clergy; and every tavern-keeper is bound, under the penalty of a heavy fine, to have a copy of them hung up in the principal rooms of his house.—*Flowers of Anecdote.*

CHANGE OF TIMES.

When the late Mr John Newberry, of St Paul's Churchyard, projected the publication of a weekly newspaper in 1758, now about 80 years ago, to be called *The Universal Chronicle*, he employed the celebrated Dr Johnson to furnish a short essay on such subjects of a general or temporary kind as might suit the taste of newspaper readers, and distinguish the new paper from its contemporaries. The reason assigned for printing this essay is not only extremely curious to the caterers of public news of the present day, but is a remarkable fact in the history of newspapers. The printer stated that *the occurrences of the week were not sufficient to fill its columns.* Those who now publish weekly newspapers find it not only difficult but impossible to insert half the articles which have entertained other readers during the intervals of publication, and which, from the common impulses of domestic or public curiosity, their readers think they have a right to expect. It is also worth mentioning, that the essays written for the purpose of filling a vacant column in the above-mentioned paper by Dr Johnson, were afterwards collected into a volume, and form the well-known work called *The Idler.—Flowers of Anecdote.*

OIL OF COD'S LIVER IN SCROFULA.

Dr Roesch (a medical writer in Germany) adopts as his grand hypothesis, the fact that scrofulous humours show a predominance of acid, and recommends, after the practice of the ancients, the use of absorbents, alkalies, and greasy substances. He declares that, in countries where fat bacon is used, scrofula is rare, and recommends strongly the use of cod's oil, which, having a chemically neutralising action, is stimulating, strengthening, and nutritious.—*Medical Times.*

[We know nothing of the correctness of the above theory, but seeing that it issues from a respectable quarter, we should think it well worthy the attention of medical practitioners, and also of those afflicted with the disease mentioned. The eating of fat bacon or the incorporation of cod oil with food, is so simple a remedy that it could do no harm to try it.]

TO RELIEVE CHOKED CATTLE.

A neighbour of mine called on me one morning, a few years since, to assist him in relieving an ox of his that was choked some time since during the night, in consequence of breaking into an orchard. The ox was much bloated and in great distress, and, it appeared, could not live many minutes. While making active preparations in order to relieve him, an elderly lady belonging to the family emptied part of the contents of a small snuff-box into her hand, and applied it to the nose of the ox. The relief was almost instantaneous. The bloat rapidly diminished, and the ox in five minutes after ate some hay laid before it. I never heard of the remedy before, nor have I known it tried since; but in that case it was effectual.—*From a Correspondent of the American Silk-grower's and Farmer's Manual.*

ZOOLOGY.

A treatise on this subject, of which it offers a complete view, according to the most approved authorities, has just been added to "Chambers's Educational Course." The following is now the list of works issued in the series, all designed for use in schools, and neatly and strongly bound in coloured cloth:—

Infant Treatment Under Two Years of Age,	1s. 3d.
Infant Education From Two to Six Years of Age,	2s. 0d.
First Book of Reading,	0s. 1½d.
Second Book of Reading,	0s. 3d.
Simple Lessons in Reading,	0s. 10d.
Rudiments of Knowledge,	0s. 10d.
Introduction to the Sciences,	1s. 0d.
The Moral Class-Book,	1s. 6d.
A Geographical Primer,	0s. 8d.
Text-Book of Geography for England,	0s. 10d.
Introduction to English Composition,	0s. 6d.
English Grammar, Part I.,	1s. 6d.
First Book of Drawing,	1s. 6d.
Second Book of Drawing,	1s. 6d.
Animal Physiology,	1s. 9d.
Rudiments of Zoology,	4s. 0d.
Rudiments of Chemistry, by Dr D. B. Reid—a new and greatly improved edition,	2s. 3d.
Natural Philosophy, First Book,	0s. 10d.
Natural Philosophy, Second Book,	0s. 10d.
Natural Philosophy, Third Book,	0s. 10d.
Elements of Algebra, Two Parts, each	2s. 6d.
Elements of Plane Geometry,	2s. 6d.
Solid and Spherical Geometry,	2s. 6d.
History and Present State of the British Empire,	2s. 6d.
History of the English Language and Literature,	2s. 6d.
Principles of Elocution, by W. Graham,	3s. 0d.
History of Greece,	3s. 0d.
Exemplary and Instructive Biography,	2s. 9d.

To the foregoing is added a Series of SCHOOL-ROOM MAPS of a very large size—Maps of England, Ireland, Scotland, Europe, Asia, Palestine, North America, South America, Africa, and the Hemispheres, designed by James Fairbairn, Esq., Rector of Bathgate Academy. Each Map measures 5 feet 8 inches in length by 4 feet 10 inches in breadth. Price, coloured on cloth, with rollers, 14s. each; the Hemispheres (including Astronomical Diagrams), 21s.

Published by W. and R. Chambers, 339 High Street, Edinburgh. *Agents*—W. S. Orr and Co., Amen Corner, London; and W. Curry Jun. and Co., Dublin; John Macleod, Glasgow; and sold by all Booksellers. In cases where Teachers find a difficulty in getting supplies from Booksellers, they may apply direct to Messrs Chambers or their chief Agents, as above.

London: Published, with permission of the proprietors, by W. S. Orr, Paternoster Row.

Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

CHAMBERS'
EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 543. SATURDAY, JUNE 25, 1842. PRICE 1½d.

THE BEAUTIFUL.

MOST minds above the rudest condition are sensible of beauty in certain objects and trains of ideas. They see with one consent the loveliness of flowers, of elegant buildings, and of the best productions of their native literature. A beautiful young woman, ushered into society, never fails to command general admiration. Thus, there seems to be no room for doubt that such a thing as beauty exists, or at least that there is something which the human mind recognises as such. Yet, strange to say, this is not only doubted, but, in the philosophical world, the predominant theory at present is, that there is no such thing as beauty. Perhaps we should not say that this is strange; for philosophers, as we have hitherto known them, are a race remarkably ill to satisfy about any thing that appears tolerably obvious. When a thing looks clear, plain, and above board, they suspect it only all the more of being not as it seems. It is only when they have got it wrapped up in an immense mist of abstruse inquiry and speculation, that they feel quite at their ease about it. At length, when they have made it pretty nearly unintelligible to simple minds, they pronounce the question as settled, and then set about mistifying or mystifying something else. One would almost suppose them to have the same opinion about philosophical truths as the old woman had about tooth-drawing, namely, that unless the ascertainment of them is attended by a vast deal of trouble, difficulty, and pain (analogous to the said old woman being dragged an hour round the farrier's shop), there is no philosophy in the matter.

Accordingly, they have endeavoured to find the sources of our notions of beauty just as far from the place where they lie as possible. They hold our feeling of beauty to be something entirely reflective in and through the mind of the beholder. A pretty girl is not really pretty. We only *associate* with her fine mixture of red and white, and her well-chiselled features, ideas of the innocence and loveableness of her character at that period of her life; and it is these notions of her innocence and loveableness which make us call her beautiful. Take, again, a choice piece of landscape, such as is to be found in Wales, where we have "lofty mountains and rocky and lonely recesses—tufted woods hung over precipices—lakes intersected with castled promontories—ample solitudes of unploughed and untrodden valleys—nameless and gigantic ruins—and mountain echoes repeating the scream of the eagle and the roar of the cataract." Be on your guard, my friends, against supposing this to be beautiful. "It is sympathy with the present or the past, or the imaginary inhabitants of such a region, that alone gives it either interest or beauty. The leading impressions here are those of romantic seclusion and primeval simplicity; lovers sequestered in these blissful solitudes, 'from towns and toils remote;' and rustic poets and philosophers, at a distance from the low pursuits and selfish malignity of ordinary mortals." There are also "images connected with the monuments of ancient magnificence and extinguished hostility—the feuds, the combats, and the triumphs of its wild and primitive inhabitants, contrasted with the stillness and desolation of the scenes where they lie interred—and the romantic ideas attached to their ancient traditions, and the peculiarities of their present life; their wild and enthusiastic poetry—their gloomy superstitions—their attachment to their chiefs—the dangers, and the hardships, and enjoyments of their lonely huntings and fishings—their pastoral shielings on the mountains in summer—and the tales and the sports that amuse the little groups that are frozen into their vast and trackless valleys in winter. Add to this the traces of vast and obscure antiquity that are impressed on the language and habits of the people, and on the cliffs, and caves, and gulfy torrents of the land—and the solemn and touching reflection perpetually recurring, of the weakness and insignificance of perishable man, whose generations thus pass away into oblivion, with all their toils and ambition, while nature holds on her unvarying course, and pours out her streams, and renews her forests, with undecaying activity, regardless of the fate of her proud and perishable sovereign." It requires all these things, we are told by Lord Jeffrey,* to make us think a show-place in Wales pretty. "The mere forms and colours that compose its visible appearance, are," says he, "no more capable of exciting any emotion in the mind, than the forms and colours of a Turkey carpet!"

Now, did no man ever see beauty where there was neither innocence nor loveableness? Let the ladies painted by Sir Peter Lely at Windsor, or any street in the west end of London, answer the question. Have pretty women a monopoly of any of those moral qualities which our authority would represent as the causes of our sense of their beauty? Are not women possessed of "youth and health," of "innocence, gaiety, sensibility, intelligence, delicacy, and vivacity" (the detailed range of qualities presented by Lord Jeffrey), without the least regard to the comparatively rare accident of their possessing beauty? Was any ordinary human being ever conscious of going through a train of associations as to youth, health, &c., before making up his mind to think this or that a pretty girl? The question as to the piece of Welsh scenery is even a clearer case. Wales has a romantic history, tales, traditions, harpers, and so forth; the lake scenery of Cumberland has not. Yet did any one ever refuse admiration to the latter on account of this want? Or was any one (not a philosopher) ever sensible, in looking at either, of any thing but a pleasing impression from the landscape before him? There are parts of the world which never were inhabited, yet which exhibit equal beauty to the finest of these scenes. Suppose any man above the condition of a savage to be brought into these parts of the earth, can we imagine that he would think them tame and ugly, because there was no romance associated with them? Would he not, in such a district, be as fully alive to the difference between a wood-bordered lake, with its adjacent rocks and waterfalls, and a common moor or tame hill-side, as he would be in his own country? It may be said, he has been accustomed in his own country to associate romantic ideas with such scenery; and it would therefore be from the habit of such associations, that he would pronounce the fine scene in the new country to be beautiful. But could any unprejudiced person seriously allow weight to this objection? The fine scenery of our own country, with which romantic ideas are associated, is not extensive, or much under observation. Most persons acquire their ideas of beautiful scenery from places which, like the knife-grinder, have no story to tell; and many have no means of becoming acquainted with beauty of scenery from actual observation. Can it be for a moment supposed, that only those who have visited Wales or Perthshire, would be capable of appreciating the beauty of the Llangollens and Loch Katrines of an American wilderness?

The latest, and, we would hope, the *last*, supporter of this theory, is Sir Thomas Dick Lauder, in a new edition of Sir Uvedale Price's *Essay on the Picturesque*. He brings forward Mr Crabbe's tale of the *Lover's Journey* as an illustration irresistible. "The poet," he says, "describes a youth mounting his steed gaily in a fine summer morning, to ride to a neighbouring town, and meet, by appointment, the lady of his love. He travels over a barren heath, through lanes of burning sand, over a common, through fens and solitary salt marshes; in short, through a wretched country, remarkable for its tedium and monotony, devoid of trees, meagrely covered with herbage of the worst description, and thinly animated with figures in themselves any thing but agreeable. Full of joyful anticipation, he sees nothing but beauty and exhilaration in all he looks upon. He reaches the town, and arrives at the house of his fair one, where, instead of finding her, he receives a note informing him that she had been carried off by a friend on an excursion to her country house. Her note bids him follow her. Again he mounts, though in very bad humour; and, accordingly, while he now rides through a range of scenery which is naturally as rich and beautiful as the former was poor and ugly, and although all the accidental circumstances connected with it are of the most pleasing and enlivening description, his eye, jaundiced by his unlooked-for disappointment, turns all he beholds into gall, and he sees nothing but deformity, both physical and moral, in the scenes through which he passes. He meets his charmer at her friend's house, and returns with her through the same lovely scenes to the town where she lives. They gave him actual pain before, but now he is too much occupied with her conversation, and delighted with her smiles, to notice them at all, more than if he were passing through them blindfolded. On the morning of the ensuing day, he returns home through the same dull scenery he had previously traversed on his way to visit the lady, but having now left his imagination behind with her who has his heart in keeping, he passes by all its monotonous and naturally disagreeable features, as if the shades of night veiled them from his view. I think that a happier illustration than this tale affords of the fact, that our emotions of beauty are altogether dependent on the imagination, cannot be produced. To use the poet's own words:

> 'It is the soul that sees; the outward eyes
> Present the object, but the mind descries;
> And thence delight, disgust, or cool indifference rise.
> When minds are joyful, then we look around,
> And what is seen is all on fairy ground;
> Again they sicken, and on every view
> Cast their own dull and melancholy hue;
> Or if absorbed by their peculiar cares,
> The vacant eye on viewless matter glares,
> Our feelings still upon our views attend,
> And their own natures to the objects lend.'"

Now, there is no doubt that we think well or ill of things just as we may be agreeably or disagreeably affected by them, or as our minds may be agreeably or disagreeably affected by other things at the moment; but what has this to do with the question of beauty? The lover—Mr Crabbe himself, we think his son tells us in his life—passed over the moor and fen without being conscious of their ugliness; or grant that he even thought them beautiful. He afterwards passed over a fine piece of country without being conscious of its charms, or perhaps condemning it as uninteresting. But will any man seriously pretend that the character of a piece of scenery is to depend on such accidents as the mood of the person passing over it? We appeal from Mr Crabbe in love to Mr Crabbe not in love, and ask him, with a steady mind and judgment, to say if he thinks the fen a paradise, and the fine district a desert. What will be his answer? Why, that, to tell the plain truth, he thinks the fen a fen, and the fine district a beautiful piece of country; but on that agitating day when he made his journey, he

* Article *Beauty*, in the "Encyclopædia Britannica."

was not in a condition to judge rightly. His poem, he will add, was only designed to show that things appear to us very much as the mental medium through which we see them may be at the time; but he was not writing a treatise on the beautiful.

Sir George Mackenzie has lately published an essay, designed to show the baselessness of the association theory; and that there is an absolute character in things, and in the way in which things exist, which a faculty of our mind, specially devoted to the purpose, recognises as beautiful.* Some of the propositions by which Mr Alison, in his essay on Taste, has supported that theory, are very ably met and refuted by Sir George. Mr Alison says, that the forms of warlike implements and furnishings are in general sublime, in consequence of the ideas of danger and power which we associate with them. Sir George Mackenzie points out that, on this ground, we should see greater sublimity in the stumpy mortar than in the elegant thirty-two pounder; and asks, "What can make us consider the form of a grain of gunpowder, a piece of rope-match, or a drumstick [he might have added, the sound of a drum], as sublime or beautiful?" "If the theory of association be correct," says Sir George, "every thing should be felt to be sublime as soon as we can attach to it scenes, events, or circumstances, which are said to be calculated to raise emotions of sublimity. No one, however, can prevail on himself to consider the stump of a pen as a sublime object. Nevertheless, we can associate it with certain circumstances, the whole sublime force of which is most sensibly felt. In a goose-quill, Bacon found means to teach us the genuine method of pursuing science, and Shakspeare to raise every emotion of which the mind is capable."

Mr Alison, in the opinion of his followers, has completely refuted the idea of men of artistic taste, that there is any thing intrinsically beautiful in Grecian architecture. "While," says Lord Jeffrey, "he admits, in the most ample terms, the beauty of the objects in question, he has shown, in the clearest manner, that it arises entirely from the combination of the following associations:—1st, The association of utility, convenience, or fitness, for the purposes of building; 2d, Of security and stability, with a view to the nature of the materials; 3d, Of the skill and power requisite to mould such materials into forms so commodious; 4th, Of magnificence, and splendour, and expense; 5th, Of antiquity; and, 6th, Of Roman and Grecian greatness." On this subject, Sir George Mackenzie's remarks are extremely acute, and quite conclusive:—"As men unacquainted with the theories of philosophers have been appealed to in support of the theory of association, I propose to take a person of that description to a proper point, within view of a building presenting all the elegance of the Grecian architecture, but of the existence of which he had no previous knowledge, nor of the rules and proportions followed. Will this person admire the structure, or will he not? Will he instantly feel an emotion? Or will he take time, before he utters a word, or allows himself to be moved, to find out for what purpose it was erected; and whether, according to his own ideas, it be adapted for that purpose? Does he suspend his feelings till he has examined the kind of stone, and learned its qualities; till he has probed the thickness of the walls, and dug down to the foundation to ascertain whether it be rock or sand? Will he pause to consider whether much skill and much power were exerted in the erection? Will he hesitate till he calculates the expense? Will he approach the portal till he searches for the date? Will he sit down to meditate quietly on the greatness of Rome and of Greece? If he did all this, no one would be astonished at his being called little better than insane. So far from such an operose process being consequent, we should find the effect instantaneous—and although it should be discovered, after a painful search, that, in its interior arrangement, this fine building was ill adapted to its purpose—that it was constructed of a stone far from durable, and on an unstable foundation—that it cost but little money, and was but a month old—the only feeling which such circumstances are likely to excite, is regret that so imposing an exterior had not been formed of more durable materials, and that the accommodations were ill contrived; it would never be said that the elevation was ugly. * * To prove that association has little connexion with the admiration which architecture excites—that there is something in our minds which directs us to prefer certain forms, and certain proportions in one form relatively to another—I have only to go back to the individual who invented any of the orders belonging to Greece, or to him who invented the Gothic style, or to any one who has improved on the first idea of them; and to ask, what could have led an individual to construct what he had never seen or heard of? What could have induced him to fix on certain proportions for one part of a building to bear to another? Nothing, surely, but his own innate powers. He must have felt certain forms to be more pleasing than others; certain arrangements of these forms to be more satisfactory than others. To him certain proportions in columns were irresistible, and he reduced them to practice. Subsequent ages have felt that they cannot be altered without giving offence."

Sir George brings up other arguments of equal cogency; but we are tired already of quoting from a refutation of what is self-evidently absurd. We remember reading a theory as to sucking in children, making it out to be, not the result of an instinct, as it obviously is—an instinct created because it was needed—but the effect of an irritation of the gums, by which the child was induced to grasp the nipple that he might allay the pain. This luminous idea is much like the association theory. Both seem to have been the effect of that peculiarity in some minds which leads them to reject all ready, accessible, and simple solutions, and take up with those only which no common mind would light upon or can well understand. The theory has given rise to much beautiful and ingenious writing; and for the name of him who may be called its author, the late Mr Alison, there can be but one feeling of something more than respect amongst all who set a value on high intellectual and moral qualities. But the theory is error, for all that; and, like all other errors, deserves nothing but ridicule and condemnation.

We have no hesitation in giving in our adhesion to the rational views advocated by Sir George Mackenzie, which regard the beautiful as an absolute character in things, and in the mode of their existence, recognised and delighted in by a special faculty of the mind. The great argument of the association party against this hypothesis is, that if there were a special faculty of the mind to cognise the beautiful, all human beings would think the same things beautiful; whereas, it is notorious that some see beauty in objects which to others are disgusting. But it does not necessarily follow, that, where there is a special faculty of the mind, all are to possess and manifest it alike. Reason is an attribute of man, and one of his faculties; but we know very well that some individuals of the race, and even whole nations, show very obscure traces of judgment. So do some individuals and races show very obscure and doubtful traces of the faculty for the perception and appreciation of the beautiful. The taste of the Moor in favour of women who are monsters of fat, is a fact precisely analogous to the notion of a boor or savage, that a piece of stick or stone will cure a disease, if hung round the neck of the patient. The faculty is there rude and undeveloped; and we require to have undergone some general mental cultivation before we can manifest its full power. Strictly speaking, the value which these low natures are found to put upon ungraceful objects, is not an exercise of this faculty at all, but an emotion of some other feeling, perhaps, which has nothing to do with it, or possibly a mere caprice, or eccentricity; the sense of the beautiful all the while lying dormant within them. So, also, we believe, it is with many of the so-called contrarieties of taste amongst educated men. About fifty years ago, a plain country girl arrived in Edinburgh, and became house-maid to a gentleman, who soon after rose to be a judge of the supreme civil court. Black and uncomely, and possessed of no mental attraction above her compeers, she somehow impressed her master so favourably, that, to the great distress of his relations, he made her his wife. Left a widow, this woman obtained a second husband, also of respectable condition in life, a wealthy West India planter. The world would say, that both of these gentlemen had seen some beauty in the woman which other people could not see; and the association gentlemen would hold the case to be a capital illustration of the non-existence of absolute beauty. But we rather say that this woman was in reality plain—an object possessing no beauty—and that it must have been owing to some peculiarity entirely independent of that quality that she was so highly preferred. The preferences which men show with regard to the opposite sex, or articles of food, styles of music, or forms in art, appearances in natural scenery, and in a thousand other matters, are said to be their taste; but taste does not refer to beauty alone. The preferences of all the various feelings of the mind are included in taste; and the sense of the beautiful is only one of these. Association also comes in to add some perplexity to the subject. A Scotchman will be found seriously preferring one of his simple native airs to the finest pieces of Mozart, Haydn, and Rossini: the native melody is, indeed, beautiful; but the judgment of Europe at large says, that the works of the great modern masters are more beautiful; and no Scotchman who, like us, prefers truth to Scotland, can doubt that Europe is right. Here the preference must mainly be owing to the many pleasing recollections and affections which are associated with the native melody. But, then, this is not the sense of the beautiful which is judging; it is association. And it is because few things are presented to us which are not more or less connected with associations, that the idea of association being the sole cause of the feeling of beauty, has arisen. It is altogether a delusive mistake of one thing for another.

It is almost melancholy to think of the great misexpenditure of talent and eloquence upon this subject, and the great extent to which the original delusion has affected the judgments of the higher class of reflecting intellects during the two last generations. Even yet, the theory of association is that which would pass current in a university or any other authoritative quarter; while the true explanation would be regarded as a most unscholarly heresy. But, fortunately, error is necessarily of a transient nature, and truth ever tends to a mastery. While the men who were brought up in this delusion continue to live, the prestige of their names will probably keep it more or less in vigour; but it will perhaps be their fate, even before they leave the stage, to see their favourite doctrines beginning to be generally condemned and forsaken; and very surely, ere they have long been withdrawn from the scene of life, all the elegant writings by which the delusion has been supported, will be swept aside as only so much rubbish, though rubbish sparkling with the fragments of fine thought.

* The Theory of Taste founded on Association, Tested by an Appeal to Facts. By Sir George Stewart Mackenzie, Bart., F.R.S.S.L. and E., &c. Edinburgh: Maclauchlan and Stewart. London: Simpkin, Marshall, and Co.

BURNES ON CABOOL.

The late Sir Alexander Burnes had sent home, it would appear, previous to his unfortunate decease, an account of his "Journey to, and Residence in, the City of Cabool, in the years 1836, 1837, and 1838."* His general object in this expedition was to examine the capabilities of the river Indus for commercial voyaging, and, with the like ulterior views, to conciliate the chiefs of Sinde, Cabool, and other districts on the line of that great stream and its feeders. The journey was undertaken at a period considerably antecedent to the commencement of the struggle yet going on in Cabool; but Sir Alexander's description of that region and its inhabitants cannot fail, notwithstanding, to possess much interest under present circumstances.

It may be observed, by way of introduction, that the modern province of Cabool—otherwise called Affghanistan, throughout the greatest part, at least, of its extent—forms only a petty remnant of the vast kingdom of the same name, which once extended from Meshid to Delhi, and from the ocean to Cashmere. It lies on the western side of the upper half of the Indus, having Persia on the west, Beloochistan and Sinde on the south, on the east the territory of the Punjaub, and on the north the country of the Tartars and the deserts of Bokhara. The whole extent of the existing Affghan empire is estimated, by a late author, to amount to 18,000 square miles, and its population to one million; but this is probably below the mark in both instances. The country is elevated and mountainous, the average height of its plains above the sea being betwixt five and six thousand feet. This elevated position renders the cold extreme in winter; while, lying little more than thirty degrees north from the equator, the defiles of the region are also pervaded in summer by heat to an equally oppressive extent. Affghanistan, moreover, is most peculiarly situated as regards natural strength, being only accessible by passes of great length and the most rugged character.

With the city of Cabool, the capital of this region, Candahar, and various other places of consequence, Affghanistan fell a number of years ago under the sway of Dost Mahomed Khan, one of those able adventurers who, as in the case of Hyder Ali and others, have so often wrested from the hands of the imbecile legitimate princes of India their abused place and authority. The legitimate prince of Cabool, Shah Shoojah ool Moolk, applied to the British for aid to reinstate him in power; and, partly to support an ally, and partly to punish some aggressions on the part of Dost Mahomed, Sir John (Lord) Keane took the field, and reduced him to submission. But a short tranquillity only followed. Though Dost Mahomed remained quiet, his son raised the Affghans against Shah Shoojah and the British, and Cabool seems destined to become the scene of a new, lengthened, and dangerous contention.

The principal towns whose names have from this cause become interesting, are Cabool, Jellalabad, Ghuznee, and Candahar. Cabool lies about six thousand feet above the sea, in a triangular gorge of the mountains, and on a feeder of the Indus, called the Cabool River. It contains one or two good streets and bazaars; and the houses are high, flat-roofed, brick erections. A mud wall, of trifling strength, encompasses the city. The population, according to Burnes, amount to 60,000 persons, and the whole of them depend greatly on commerce for subsistence. The shawls of Cashmere pass through Cabool to Persia and Turkey, and English goods come to the city, to be sent into Bokhara and other internal places. Jellalabad is an insignificant village, consisting of about four hundred houses, and lying at no great distance to the east of Cabool. But in the intermediate space is a frightful pass, where 13,000 British bodies already lie bleaching in the sun. Ghuznee is a town and fort, situated a short way to the south-west of Cabool, and contains about 16,000 persons. The fort is held by a small British force, but the town is hostile. Candahar, again, is a city of some antiquity and considerable strength, lying still farther to the south-west of Cabool. It contains a population of about 25,000 souls.

This notice of Cabool has kept us too long from Sir Alexander Burnes. He describes the Affghan territory as containing various races of men, mixed and unmixed, from the Toork, the genuine Hindoo, and the Affghan mountaineer, to the Kaffir, or infidel, the Tartar, and the Persian Kuzzilbash. The Affghans have an idea that they are of Jewish descent. Dost Mahomed himself said to our author, "Why, we marry a brother's wife, and give a daughter no inheritance; are we not, therefore, of the children of Israel?" Some hazy fancy about the ten lost tribes seems to have found its way among them; but it is

* London: John Murray.

certainly true that they have many customs similar to those of the Jews, and have even genealogical trees directly tracing their affinity to that nation. Before he reached Cabool, Sir Alexander Burnes had to make his way from the Indus through the Khyber Pass, a close and frightful defile, not less than *ninety miles* in length, and which, in present circumstances, is a spot of no common interest. A battle between the Affghans and the Sikhs had recently taken place at the mouth of the pass, and the effluvia from the unburied dead was revolting. However, depending on the friendliness of Dost Mahomed, and having written to the chiefs of the pass, Sir Alexander Burnes ventured among the numerous robbers of the defile, attended by a small escort of a dozen Arabs. "Our march was not without a degree of anxious excitement: we were moving among a savage tribe, who set the Sikhs at defiance, and who paid but an unwilling allegiance to Cabool; we had no guard of our own, except about a dozen Arabs, and we had considerable property with us. We were also stopped at every by-road and defile, as we came among the different subdivisions of the tribe. At Jubugee, they, in conclave, requested us to halt for the night, and pointed out the rock near which Nadir Shah had slept on his advance to India; but not even the historical association attached to the sleeping place of that 'Persian robber,' as Gibbon calls him, could convince me of the propriety of halting there; and, after a good deal of parleying, we were allowed to advance, and reached Ali Musjid about eleven o'clock, all our baggage preceding us—a very necessary precaution in journeying among Khyberees. By the road they showed to us many small mounds, built to mark the spots where they had planted the heads of the Sikhs whom they had decapitated after the late victory: on some of these mounds locks of hair were yet to be seen.

We had scarcely pitched our camp in the confined ground below Ali Musjid, and in the dry bed of the river, when the rolling thunder gave notice of rain; and it soon came down in such torrents as must have washed us back to Jumrood, had it not been for the great activity of our own people and the assistance afforded us by the Khyberees. Tents, boxes, and every thing, were dragged by main force up the steep sides of the defile, on which we were constrained to remain, drenched to the skin, and totally without shelter; and by no means in that placid state of mind which would enable us to have enjoyed the sublimity of the scene; for sublime it certainly was—the water rolling in a torrent down the bed of the pass, driving bushes and every thing before it, whilst water-falls, in all directions, and of all hues, came rushing down around us, some of them in an unbroken fall of more than three hundred feet—all of these bursting out, one after another, from unseen crevices in the towering rocks by which we were surrounded. In all this confusion, and, indeed, throughout our previous march, we had a good opportunity of studying the Khyber Pass, which must always be formidable, and more especially so in rainy and boisterous weather. We had found the road as good as it had been represented; and the people, lawless as their habits undoubtedly are, had been more friendly than we could have hoped for. Next morning we were joined by Agha Jan, the governor of Jellalabad—the Momund chief, Sadut Khan—and a *shahghassee*, or officer of the court, who came with about five thousand men; and the hills rang with shouts and noise of men and arms, during all which din and tumult we remained looking on as patiently as we could, but heartily wishing ourselves fairly out of the defile. This we effected on the following morning by a march of twenty miles to Duka, and at length cleared the far-famed pass of Khyber without an accident. The last half of the pass is the most formidable; but even there it is pervious to heavy artillery. The formation is black slate and limestone rock, with deep beds of conglomerate, in which are rounded pebbles. At Ali Musjid, the water jets beautifully out of the rock, and flows towards Jumrood; but for some distance between these two places it has a subterraneous course. There is something in this water which renders Khyber extremely unhealthy in the hot weather; and we were told that after standing for a night, it is covered with an oily substance.

In the last part of the road, at Lundee Khanu, a village composed of thirty or forty small forts, and built where the pass opens, we saw a 'tope' in good preservation, and in a commanding position. Farther on, and before reaching a place named 'Huft Chah,' or the seven wells, we passed to our left a hill crowned by a long fort, and called by the inhabitants the 'Kaffir Killa,' or Infidel's Fort, to which tradition assigns a very ancient date. There is a ruin of a similar kind north of the Cabool river; and my inquiries led me to the conviction that there are many such remains in Affghanistan. They are, doubtless, the relics of former kings, whether the word 'infidel' has reference to a Bactrian, a Greek, or a Hindoo.

At Duka the whole of the chiefs of Khyber visited us; there are four principal and several petty ones. They asserted, that in the time of the kings of Cabool they received a lac and 32,000 rupees as pay for guarding the pass, besides the transit-duties; and they offered, on a renewal of this, again to open the road to commerce. I found, however, that it was at this time actually open, and that Dost Mahomed had satisfied all their demands by the payment of some 15,000 or 20,000 rupees a-year; but their religious animosity towards the Sikhs was the best safeguard against an advance of that nation on Cabool in this direction. There are, besides, more obstacles to commerce in the Punjaub than in the mountains of Khyber. The easy terms on which we were enabled to satisfy the Khyberees for the friendly and really important services which they had rendered us, did credit to their moderation. A few coarse gun-locks, some still coarser loongees and pelisses (choghas), with 375 rupees in cash, making the total value of the payment about 500 rupees, satisfied all parties."

The long and terrible pass which Burnes thus traversed, and which is flanked with immense precipices throughout, while in parts the level road-way measures but a few feet in width, must be forced ere the British in Cabool can be relieved directly from the *east*, or from Calcutta, and the difficulty of doing so can scarcely be over-estimated. The wild Affghan occupants, sashed, belted, and loosely robed, lie secure among the rocks, and either pick off the passers-by with their long matchlocks, or send them to inevitable death by hurling down stones upon their defenceless heads.

Dost Mahomed was in power, and friendly to Britain, when Sir A. Burnes reached Cabool on this occasion. "On the 20th of September we entered Cabool, and were received with great pomp and splendour by a fine body of Affghan cavalry, led by the ameer's son, Akbar Khan. He did me the honour to place me on the same elephant upon which he himself rode, and conducted us to his father's court, whose reception of us was most cordial. A spacious garden, close by the palace and inside the Bala-Hissar of Cabool, was allotted to the mission as their place of residence. On the 21st of September, we were admitted to a formal audience by Ameer Dost Mahomed Khan, and I then delivered to him my credentials from the governor-general of India. His reception of them was all that could be desired. I informed him that I had brought with me, as presents to his highness, some of the rarities of Europe; he promptly replied that we ourselves were the rarities the sight of which best pleased him. Seeing our draughtsman, Mr Gonsalvez, he asked of what country he was, and, upon being told that he was a Portuguese, made many inquiries as to the present power and prospects of that nation. When he heard that the Portuguese had intermarried with Indians, he observed, that their spell as Europeans was broken, and their fall certain. From the ameer's audience-chamber, we proceeded to the Nawab Jubar Khan, who received us in his bath, and invited us to breakfast. As we passed through the city, some of the people cried out, 'Take care of Cabool!' 'Do not destroy Cabool!'—and wherever we went, in this fine bustling place, we were saluted with a cordial welcome. Our visits were soon returned, both by the ameer and his brother the nawab. Power frequently spoils men, but with Dost Mahomed neither the increase of it, nor his new title of ameer, seems to have done him any harm. He seemed even more alert and full of intelligence than when I last saw him." From the portrait of Dost Mahomed given in the work before us, we derive a favourable idea of the ameer's character. He is a long-bearded man of advanced years, with a Roman nose, and mild expression of face; and his brow is fine, particularly in the under region, where great rounded projections above the eyes speak of acute perceptions and well-exercised faculties.

Dost Mahomed, through necessity, ruled the Affghan tribes with sternness, yet could not tame their fierce passions, as the following observations on the sub-tribe of Tajiks will show:—"It is a source of deep regret that this beautiful country should be inhabited by a race of men so turbulent and vindictive as the Tajiks have here proved themselves to be; and yet, throughout Affghanistan generally, these same Tajiks form the most peaceful classes of the population. Here, however, their blood-feuds are endless: a week never passes without strife or assassination; and I have been assured, on the best authority, that a man frequently remains immured in his own tower for two or three years from a fear of his enemies, leaving his wife to take care of his property and discharge his duties; nay, that in some instances this durance has lasted for eight and ten years. It is rare to see a man go to bathe, hunt, or even ride out, without a part of his clan attending him as a guard. Lately, a strong government has in some respects softened down these asperities; but the retribution of blood, which the Mahomedan law allows, fatally perpetuates these sanguinary habits. 'Blood for blood' is their motto and their rule; and as they still rigidly follow it up, every fresh act of violence increases the number of feuds, and extends the misery resulting from them still more widely. In time of need, as many as twenty thousand of them have taken the field, well armed with flint-lock muskets." These Affghans are indeed a fearless race; and if our soldiers have found a degree of difficulty in combating them unknown in the wars of Clive, it must be remembered that his opponents, the Hindoos, were no more like these hill-men, than the blacks of the Niger are like the Arabs of northern Africa.

We have not attempted to form any connected sketch out of a work consisting, in a great measure, of loose notes, as the present does. Yet the information which it contains is very valuable, and will add to the high estimation in which the name of Burnes is already held. War found him in the regions he has described, and there he closed his unfortunate career.

NOTES OF A RESIDENCE IN THE BUSH.

BY A LADY.

SECOND ARTICLE.

COMMENCEMENT OF BUSH LIFE—JAUNT TO MELBOURNE.

[THE first of this series of papers brought the lady, with her husband and family (including her two brothers), to their hut, a hundred and twenty miles *back* from Melbourne. We are now to see them settled in their run.]

I now hoped that my travels were ended for some time. As we approached the hut, my brother Robert came running to meet us, to my great joy, for I had not seen him for nearly two months. When we arrived, we found my other brother busy making himself a bed-stead. Our house was not nearly finished, as it had neither doors nor windows, nor could we get these luxuries for some months, as many things more immediately necessary were yet to be done; but I did not mind it much—I was getting inured to these little inconveniences. We had plenty of daylight in our hut, as it was built of slabs, or split boards, and every slab was about an inch apart from the next. We passed the winter in this way; but it was never very cold except in the mornings and evenings: we were more annoyed by the rain coming down the chimney and putting out our fire than by any thing else. Our hut consisted of three apartments—a sitting-room, our bed-room, and a store in the middle, which was afterwards converted into a bed-room for my brother; at first he slept in the sitting-room, until we built a detached store. Mary and her husband had a little turf hut, built a short way behind our hut, which was also used as a kitchen.

It may seem strange, but I now felt very happy and contented. Although we had not many luxuries, we all enjoyed good health, and had plenty to keep us employed; we had no time to weary; the gentlemen were always busy building huts or fences. The first two years of a settler's life are very busy ones, so much is to be done in settling on a spot where the foot of a white man had never been before. I was the first white woman who had ever been so far up the country. I found Mary very ignorant in cooking; however, in a short time, she managed pretty well: she was always delighted when I taught her any new dish out of "Meg Dods." I did not know much of cooking myself, but necessity makes one learn many things. We had many visiters, who seemed often to enjoy any little new dish we had; it was a change from that everlasting mutton and damper, and many a receipt I gave away; and to my great delight, I got Mary to do as *I* liked, not as *she* liked. Sandy, our shepherd, generally came home in the evening loaded with wild ducks; they were exceedingly good. We also sometimes got wild geese, turkeys, and swans—all good eating; they were a great saving to us as well as very delightful food. In Melbourne, wild ducks sell at twenty shillings a-pair, and we sometimes had thirty in a week. We had no milk or butter, which I missed at first, but we hoped some time soon to have a few cows: it is very difficult to drive cattle so far up, and we could get none near us. Our nearest neighbours were Messrs Donalds and Hamilton; they were within four miles, and were pleasant neighbours—we often saw them. The Baillies were eight miles on our other side; we also saw them often, and liked them much.

When we had been in our hut about a week, a number of settlers happened to come from different parts of the country. Before it was dark eight had assembled, with the determination of remaining all night of course. I felt much anxiety about giving them beds; but that was impossible, as we had only one spare mattress. I think they guessed my thoughts, for they told me never to think of giving them any thing to sleep on; that no one in this country ever thought of beds for visiters, and that they would manage for themselves. However, I collected all the blankets, pea-jackets, and cloaks, I could find, and they all slept on the floor; I heard them very merry while making up their beds. Every settler, when riding through the bush, carries either a kangaroo rug or a blanket fastened before him on his horse, so that, wherever he goes, he is provided with his bed; and as it is not an uncommon circumstance for one to lose himself in the bush, and be obliged to sleep at the root of a tree, he then finds his rug or blanket very useful. William Hamilton lost himself in the bush one night. It became dark, and he gave up hopes of reaching any station that night, as he had not the least idea where he was. He fastened his horse, and lay down at the root of a tree, far from being comfortable, as he had unfortunately no blanket, and still worse, no tobacco, or the means of lighting a fire. It was a very cold night, and when daylight came, he got up covered with frost; he heard some dogs bark, and soon found out that he was not more than half a mile from Mr Baillie's hut, where he might have passed a much more comfortable night; but he was glad he had not to look long for a breakfast and a fire: no one seems ever to catch cold from sleeping out at night.

We were rather unfortunate in frequently losing our bullocks, which kept back all the buildings. Our bullock-driver was very careless; his only work seemed

to be finding his bullocks one day, and losing them the next; he was a melancholy-looking little man, and went by the name of "Dismal Jamie." Mary told me she was sure he had been a great man at home, he read so beautifully, and knew so much; but certainly he knew little about bullock-driving. At this time our dray was often a month away upon a journey to and from the settlement. "Dismal Jamie" broke the neck of a beautiful bullock when he was yoking it up, and next trip he drowned another in a water-hole; but new settlers always meet with a few such accidents. Although bullocks often disappear, and wander far from home, I never heard of any one losing a bullock entirely: they are always found some time, though it may be months after they are missed, having in general gone back to the run they were first put upon.

Buying and selling are favourite amusements in the bush, more particularly if a new settler arrives: every one wants to buy something of him; and, in general, all bring so many more clothes, &c., than they require, that they are glad to dispose of them. I have seen some rather amusing scenes in this way. No one keeps any money in the bush; so a bill is generally given on some store in town for whatever is bought. The old settlers would give an enormous price for good fire-arms; indeed, I used to think they would buy any thing.

It is a beautiful sight to see a number of emus running across a plain; they run so quickly that a horse can scarcely overtake them. I saw seven one day run across our marsh; but we could get none of them, as we had no horse at hand. Sometimes the natives run like the emu to deceive the white people; and they imitate them so well, that it is difficult, at a distance, to know them from a flock of emus. Occasionally they take a fancy to stand in such an attitude that you cannot, at a little distance, tell them from the burnt stump of a tree: I used often, when walking in the bush, to fancy a burnt stump was a native, and made myself believe I saw him move. Mr Neven came one evening to our station; he was in search of a new run, his old one at Boning-yong being too small for his increasing stock; he had his dray along with him, carrying provisions, so we gladly exchanged with him mutton for beef; it was a mutual benefit, as we had always mutton and he had always beef. His bullock-driver always took his little son with him, as he was as good as a native in finding the bullocks for him in the morning. The little boy was about seven years old; little Agnes was in the servants' hut when he arrived, and she came running to tell me to "come and see the *wee wee man* in Mary's hut;" she had been so long separated from children, that I suppose she thought there were none but herself in the world. The little boy was very ill pleased with Agnes, as she kept walking round him to examine him, asking him many questions, to which he made no reply, till at last she said, "Can no' peak any?" when he answered, "Yes," and then sat down to take his supper, accompanied by his tormentor, who was most hospitable in pressing the *wee man* to eat heartily. I got a present of a quart-potful of butter from Mr Neven, which was a great treat to us, as we had seen none since we came up the country; it made us long to have some cows. We had now enclosed a little garden, and Mr Thomson and James tasked themselves to dig up a little bit every day. The ground was very hard, being dug for the first time. We put in many seeds which we had brought from home, also some from Van Diemen's Land, as we were told the home seeds seldom grew.

In the month of September I had to proceed to Melbourne, as I expected to be confined, and we were too far up to ask a medical man to come. I was much grieved at leaving my little girl; but Mary promised faithfully to take great care of her. The weather was very unsettled and rainy, and the roads very bad. I was in a dray, covered by a tarpauline, which made it very comfortable; it was like a covered waggon; and when we could not get to a station at which to sleep, I slept in the dray. My husband was with me, and read to me very often; but we had often to come out of the dray, to allow it to be pulled out of a hole. I have seen the bullocks pull it through a marsh when they were sinking to the knees every moment; we were often in dread of the pole breaking. We received much kindness at every station we were at. We remained at Mr Reid's hut two days, as both I and the bullocks required rest. We always met with much kindness from Mr Reid: he is a most hospitable person; and as he is much liked, his hut is generally well filled, although off the main track. At this time his hut was full of company; but one room was prepared for us, and about twelve gentlemen slept in the other.

I here met our friend Mr William Hamilton. As he came from the settlement, he brought all the news; but he gave us a sad account of the state of the rivers. He said he was sure we could not cross them —it was difficult for him to cross them three days before, and it had rained ever since. Mr Reid sent off a man on horseback to see the river: he did not bring back a favourable account; but I was determined to try it. Mr Reid and several gentlemen went with us to help us over our difficulty. We crossed one river without much difficulty, though the water was so deep that both bullocks and horses had to swim; but when we came to the next river, the "Marable," it was so deep, that we were at a loss how to get over. It was thought decidedly dangerous for me to remain in the dray while it was crossing. Many plans were talked of: at last it was fixed to fell a tree and lay it across, that I might walk over; but in looking about for one of a proper size and position, one was found lying across, which, from appearance, seemed to have been there for years; it was covered with green moss; it stood about twenty feet above the water; notches were cut in it for me to climb up and give me a firm footing, and I walked over, holding Mr Reid's hand. On landing, I received three cheers. Many thanks to Mr Reid and others for their kindness to me on that journey. My husband was too nervous to help me across—he thought his foot might slip. The gentlemen then went to see the dray across, while little Robert Scott and I lighted a fire at the root of a large tree, which we had in a cheerful blaze before the gentlemen came. We then had tea in the usual bush fashion, in a large kettle: it did not rain, and we had a very merry tea-party. I retired to the dray soon after tea; the gentlemen continued chatting round the fire for some time, and then laid themselves down to sleep, with their saddles at their heads, and their feet to the fire.

We breakfasted at daybreak, and started again after taking leave of the gentlemen, except Mr Anderson, who was going to Melbourne: he rode on before to the settlement, to tell Mrs Scott (who expected us at her house) that we were coming. Mrs Scott was a particular friend of my husband at home; she came out to meet us, and I really felt delighted to see her. I had not seen a lady for eight months. Mrs Scott was exceedingly kind to me, and would not allow me to go to lodgings, as I had intended. Next day being Sunday, I went to church—at least to the room where the congregation met, as no church was yet built in Melbourne. The ladies in Melbourne seemed to consider me a kind of curiosity, from living so far up the country, and all seemed to have a great dread of leading such a life, and were surprised when I said I liked it. I spent Monday evening at Mrs Denny's, a Glasgow lady; but I really felt at a loss upon what subjects to converse with ladies, as I had been so long accustomed only to gentlemen's society; and in the bush, had heard little spoken of but sheep or cattle, horses, or of building huts.

My little boy was born four days after I came to Melbourne; but my husband did not get down from the station for two months, as it was sheep-shearing time—a very busy time for the settlers. He came down with the wool in our own and Mr Scott's dray. Mr Clow christened our baby out of a basin which at one time belonged to the Barony church in Glasgow: it belonged to Mr Scott, whose grandfather had been minister of that church, and he had got the old basin when the church was repaired and a new one substituted. I met with much kindness and attention from the people in Melbourne, particularly Mrs Clow. Our dray was again covered with saplings and tarpauline, and Mrs Scott and her family went along with us as far as their own station. I could not persuade Mrs Scott to go on to our station to remain with us till her own hut was put up; she lived for many months in a tent. We were again much detained on the roads on account of rain, which had rendered them extremely soft; but we got well over the rivers. We had to remain for two days and nights in the bush, for it rained so heavy that the bullocks could not travel; but by this time our party was increased by two drays belonging to another settler, and we had often to join all the bullocks to pull each dray through the marshes and up the hilly ground. We had, at one time, ten pairs of bullocks in the heavy dray with luggage and provisions, and we were in constant dread of the poles breaking. At last one of Mr Elm's drays broke down, and had to be left in the bush, with a man to watch it, till a new pole could be got. I believe the man did not watch it long; he ran off to Melbourne, and left it to its fate. Mrs Scott, her little daughter and servant, myself and baby, always slept in the dray, and Mr Scott and my husband under it. One morning I got into a little hut with the roof half off; it was empty, and I thought I could wash and dress my baby more comfortably than in the dray. I had not been long in the hut when we were surrounded by natives, all anxious to see what we were about. One or two of the women came into the hut, and touched the *pickaninny cooley*, as they called it; they seemed much amused at his different pieces of dress, and all the little black pickaninnies tried to cry like him. I seldom ever heard a black baby cry, and when it does so, the mother has little patience with it, but gives it a good blow with her elbow to make it quiet. The women carry their children at their backs in a basket or bag; and when they suckle them, they generally put their breast under their arm, and I have seen them put it over their shoulder. The natives whom we met here knew me; they said they had seen me before, when I went up the country with a *pickaninny leubra*, though I did not recollect any of their faces. When a black woman has a second child before the first can run about and take care of itself, it is said they eat the second one. I have been told this several times, but am not certain if it is really the case, it is so very unnatural; but it is well known they are cannibals, and I know they will not submit to any thing that troubles them. They are very lazy, particularly the men; they make their leubras go about all day to dig for maranong, or find other kinds of food for them, while they amuse themselves by hanging about idle. In the evening they meet at their *mi-mi*; the men eat first, and whatever they choose to leave, the leubras and pickaninnies may eat afterwards; sometimes a very affectionate cooley may now and then, while he is eating, throw a bit to his leubra, as we should do to a dog, for which kindness she is very grateful. Maranong is a root found in the ground; it is white, and shaped like a carrot, but the taste is more like a turnip; the leubras dig for it with long pointed sticks, which they always carry in their hands. I have often eaten maranong; it is very good; and I have put it in soup for want of better vegetables, before we had a garden. Vegetables of all kinds now grow here most luxuriantly; we could have peas all the year round, except in June.

When we were within six miles of Mr Scott's station, our pole broke; we got a dray from Mr Neven's station, a few miles off, and went in it to Mr Scott's station, where my husband and I remained two days; we then took our leave, and went on to Mr Baillie's station. Five miles from his hut, our dray broke down again in crossing a creek; I had no alternative but to walk to Mr Baillie's, which I did not much like, as I was far from being strong; we left the dray in charge of our bullock-driver. My husband took out the bullocks, and drove them on to bring back Mr Baillie's dray to carry our goods and drag the dray; I carried the baby, and the way did not seem so long as I expected. We could see Mr Baillie's huts for nearly a mile before we came to them; so I begged my husband to go on quickly, to send the bullocks for our dray before it got quite dark. I felt myself quite safe when in sight of the huts; but before I got to them I had a sad fright: four or five great kangaroo dogs attacked me, almost pulled my baby out of my arms, and tore my dress to pieces; my cries were heard at the hut, and my husband and two or three others soon came to my assistance. I was told the dogs were only in fun, and would not bite; that they seldom saw a woman, which made them tear my clothes. I thought it was rather rough fun; but I received no harm from them except a torn dress. My long walk had given me an appetite, and I enjoyed my supper very much, and was amused by some of Mr G. Yuille's eccentricities. We got home to our own station next day, after being eleven days on the road. My baby and myself were both very delicate when we left the settlement, and I dreaded much either of us being ill on the road; but we never had a complaint from the day we entered the dray, although the weather was very bad, and our dray sometimes wet through. Such a journey in Scotland would, I am sure, almost kill a strong person; but in Port Philip, so far from killing one, a little delicate baby of two months old could stand it, and gained more strength during that rough journey than he did during a month before with every comfort. I often thought of the words of Sterne—"God tempers the wind to the shorn lamb." I found little Agnes at the hut in high health. Mary, in her over-zeal, had fed her and made her so fat that I scarcely knew her. I suppose she thought the fatter Agnes was the more I should be pleased.

THE AMISTAD CAPTIVES.

A YEAR or two ago, the case of the "Amistad Captives," as they were termed, created considerable sensation in the United States; and as little or nothing is known respecting them in England, we offer the following account, which we have collected from materials in the lately published work of Mr Sturge.

During the month of August, 1839, public attention was excited by several reports, stating that a vessel of suspicious and piratical character had been seen near the coast of the United States, in the vicinity of New York. This vessel was represented as a long, low, black schooner, and manned by blacks. Government interfered, and the steamer Fulton and several revenue cutters were dispatched after her, and notice was given to the collectors at various sea-ports.

The suspicious-looking schooner proved to be the Amistad, and it was eventually captured off Culloden Point, by Lieutenant Gedney, of the brig Washington. On being taken possession of, it was found that the schooner was a Spanish vessel, in the hands of about forty Africans,* one of whom, named Cinque, acted as commander. They described themselves, with truth and consistency, to be persons who had been originally carried off from their own country as slaves, and taken to Havana to be sold; bought there by two Spaniards, Jose Ruiz and Pedro Montez, who shipped them on board the Amistad, to be conveyed to a distant part of Cuba, at which was Ruiz's estate; and that, when at sea, they overpowered their oppressors, killing the captain and part of the crew in the effort to regain their liberty, and now wished to navigate the vessel homeward to Africa. Ruiz and Montez they had not injured, but only placed in confinement, till an opportunity occurred for liberating them. Lieutenant Gedney at once secured the whole as prisoners, and sent them to Newhaven county jail, where they were detained by Ruiz and Montez, who claimed them as their property, and caused them to be indicted for piracy and murder. This was almost immediately disposed of, on the ground that the charges, if true, were not cognisable in the American courts; the alleged

* The exact number is not clearly stated by Sturge; he speaks first of forty-four, and afterwards of thirty-five; as it appears there were several children, perhaps thirty-five was the number of individuals who took a share in the fray.

offences having been perpetrated on board a Spanish vessel. The whole were, however, still kept in confinement; the question remaining to be determined, whether they should be handed over to the Spanish authorities of Cuba, who loudly demanded them, or transmitted to the coast of Africa.

It may be supposed that these proceedings excited a lively sensation among all friends of the blacks in America; and every proper means were adopted to procure the liberation of the unhappy Africans. The American government finally came to the resolution of delivering them up either as property or assassins; and Van Buren, the President, issued an order, January 7, 1840, to that effect. But, after all, the order did not avail. The district judge, contrary to all anticipations of the executive, decided that the negroes were freemen; that they had been kidnapped in Africa, and fully entitled to their liberty. They were, accordingly, set free, and allowed to go where they pleased. This event gave great satisfaction to the anti-slavery societies throughout the States; and many persons kindly volunteered to assist the late captives in their homeless and utterly penniless condition. Lewis Tappan, a member of a committee of benevolent individuals, took a warm interest in their fate, and was deputed by his brethren to make an excursion with some of the Africans to different towns, in order to raise funds. In this he was aided by Mr Deming, and one or two others; and by their united efforts, several highly interesting public exhibitions were accomplished, and some money collected. The Africans, it appears, were natives of Mendi, and possessed no small degree of intelligence. Ten were selected from among the number as being considered the best singers, and most able to address an audience in English. These were named Cinque, Banna, Si-si, Su-ma, Fuli, Ya-bo-i, So-ko-ma, Kinna, Kali, and Mar-gru. Taken to Boston, they made a deep impression on the large audiences who came to hear them sing and tell the story of their capture. In a narrative written by Mr Tappan, we find the following account of what occurred at one of these exhibitions. After some preliminary statements, "three of the best readers were called upon to read a passage in the New Testament. One of the Africans next related, in 'Merica language,' their condition in their own country, their being kidnapped, the sufferings of the middle passage, their stay at Havana, the transactions on board the Amistad, &c. The story was intelligible to the audience, with occasional explanations. They were next requested to sing two or three of their native songs. This performance afforded great delight to the audience. As a pleasing contrast, however, they sang immediately after one of the songs of Zion. This produced a deep impression upon the audience; and while these late Pagans were singing so correctly and impressively a hymn, in a Christian church, many weeping eyes bore testimony that the act and its associations touched a chord that vibrated in many hearts. Cinque was then introduced to the audience, and addressed them in his native tongue. It is impossible to describe the novel and deeply interesting manner in which he acquitted himself. The subject of his speech was similar to that of his countryman who had addressed the audience in English; but he related more minutely and graphically the occurrences on board the Amistad. The easy manner of Cinque, his natural, graceful, and energetic action, the rapidity of his utterance, and the remarkable and various expressions of his countenance, excited the admiration and applause of the audience. He was pronounced a powerful natural orator, and one born to sway the minds of his fellow men.

The amount of the statements made by Kinna, Fu-li, and Cinque, and the facts in the case, are as follows:—These Mendians belong to six different tribes, although their dialects are not so dissimilar as to prevent them from conversing together very readily. Most of them belong to a country which they call Mendi, but which is known to geographers and travellers as Kos-sa, and lies south-east of Sierra Leone, as we suppose, from sixty to one hundred and twenty miles. With one or two exceptions, these Mendians are not related to each other; nor did they know each other until they met at the slave factory of Pedro Blanco, the wholesale trafficker in men, at Lomboko, on the coast of Africa. They were stolen separately, many of them by black men, some of whom were accompanied by Spaniards, as they were going from one village to another, or were at a distance from their abodes. The whole came to Havana in the same ship, a Portuguese vessel named Tecora, except the four children, whom they saw, for the first time, on board the Amistad. It seems that they remained at Lomboko several weeks, until six or seven hundred were collected, when they were put in irons, and placed in the hold of a ship, which soon put to sea. Being chased by a British cruiser, she returned, landed the cargo of human beings, and the vessel was seized and taken to Sierra Leone for adjudication. After some time, the Africans were put on board the Tecora. After suffering the horrors of the middle passage, they arrived at Havana. Here they were put into a barracoon for ten days—one of the oblong enclosures without a roof, where human beings are kept, as they keep sheep and oxen near the cattle markets in the vicinity of our large cities, until purchasers are found—when they were sold to Jose Ruiz, and shipped on board the Amistad, together with the three girls, and a little boy who came on board with Pedro Montez. The Amistad was a coaster, bound to Principe, in Cuba, distant some two or three hundred miles.

The Africans were kept in chains and fetters, and were supplied with but a small quantity of food or water. A single banana, they say, was served out as food for a day or two, and only a small cup of water for each daily. When any of them took a little water from the cask, they were severely flogged. The Spaniards took Antonio, the cabin-boy, and slave to Captain Ferrer, and stamped him on the shoulder with a hot iron, then put powder, palm-oil, &c., upon the wound, so that they 'could know him for their slave.' The cook, a coloured Spaniard, told them that, on their arrival at Principe, in three days they would have their throats cut, be chopped in pieces, and salted down for meat for the Spaniards. He pointed to some barrels of beef on the deck, then to an empty barrel, and by significant gestures—as the Mendians say, by 'talking with his fingers,'—he made them understand that they were to be slain, &c. At four o'clock that day, when they were called on deck to eat, Cinque found a nail, which he secreted under his arm. In the night they held a counsel as to what was best to be done. 'We feel bad,' said Kinna, 'and we ask Cinque what we had best do.' Cinque say, 'Me think, and by and by I tell you.' He then said, 'If we do nothing, we be killed. We may as well die in trying to be free, as to be killed and eaten.' Cinque afterwards told them what he would do. With the aid of the nail, and the assistance of another, he freed himself from the irons on his wrists and ankles, and from the chain on his neck. He then, with his own hands, wrested the irons from the limbs and necks of his countrymen.

It is not in my power to give an adequate description of Cinque when he showed how he did this, and led his comrades to the conflict, and achieved their freedom. In my younger years I saw Kemble and Siddons, and the representation of Othello, at Covent Garden; but no acting that I ever witnessed came near that to which I allude. When delivered from their irons, the Mendians, with the exception of the children, who were asleep, about four or five o'clock in the morning, armed with cane-knives, some boxes of which they found in the hold, leaped upon the deck. Cinque killed the cook. The captain fought desperately. He inflicted wounds on two of the Africans, who soon after died, and cut severely one or two of those who now survive. Two sailors leaped over the side of the vessel. The Mendians say, 'They could not catch land—they must have swum to the bottom of the sea,' but Ruiz and Montez supposed they reached the island in a boat. Cinque now took command of the vessel, placed Si-si at the rudder, and gave his people plenty to eat and drink. Ruiz and Montez had fled to the hold. They were dragged out, and Cinque ordered them to be put in irons. They cried, and begged not to be put in chains, but Cinque replied, 'You say fetters good for negro; if good for negro, good for Spanish man too; you try them two days, and see how you feel.' The Spaniards asked for water, and it was dealt out to them in the same little cup with which they had dealt it out to the Africans. They complained bitterly of being thirsty. Cinque said, 'You say little water enough for nigger; if little water do for him, a little do for you too.' Cinque said the Spaniards cried a great deal; he felt very sorry; only meant to let them see how good it was to be treated like the poor slaves. In two days, the irons were removed, and then, said Cinque, we gave them plenty water and food, and treat them very well. Kinna stated, that as the water fell short, Cinque would not drink any, nor allow any of the rest to drink any thing but salt water, but dealt out daily a little to each of the four children, and the same quantity to each of the two Spaniards! In a day or two, Ruiz and Montez wrote a letter, and told Cinque that, when they spoke a vessel, if he would give it to them, the people would take them to Sierra Leone. Cinque took the letter, and said, 'Very well,' but afterwards told his brethren, 'We have no letter in Mendi. I don't know what is in the letter—there may be death in it. So we will take some iron and a string, bind them about the letter, and send it to the bottom of the sea.'

At the conclusion of the meeting, some linen and cotton table-cloths and napkins, manufactured by the Africans, were exhibited, and eagerly purchased of them by persons present, at liberal prices. They are in the habit of purchasing linen and cotton at the shops, unravelling the edges about six to ten inches, and making, with their fingers, net-fringes, in imitation, they say, of 'Mendi fashion.' Large numbers of the audience advanced, and took Cinque and the rest by the hand. The transactions of this meeting have thus been stated at length, and the account will serve to show how the subsequent meetings were conducted, as the services in other places were similar.

These Africans, while in prison (which was the greater part of the time they have been in this country), learned but little comparatively; but since they have been liberated, they are anxious to learn, as they said 'it would be good for us in our own country.' Many of them write well, read, spell, and sing well, and have attended to arithmetic. The younger ones have made great progress in study. Most of them have much fondness for arithmetic. They have also cultivated, as a garden, fifteen acres of land, and have raised a large quantity of corn, potatoes, onions, beets, &c., which will be useful to them at sea. In some places we visited, the audience were astonished at the performance of Kali, who is only eleven years of age. He could not only spell any word in either of the Gospels, but spell sentences, without any mistake; such sentences as, 'Blessed are the meek, for they shall inherit the earth,' naming each letter and syllable, and recapitulating as he went along, until he pronounced the whole sentence. Two hundred and seven dollars were received at this meeting."

Mr Tappan concludes as follows:—"On Wednesday, there is to be a large farewell meeting at Farmington; and in a few days the Mendians will embark from New York. May the Lord preserve them, and carry them safely to their native land, to their kindred and homes. Su-ma, the eldest, has a wife and five children; Cinque has a wife and three children. They all have parents or wives, or brothers and sisters. What a meeting it will be with these relations and friends, when they are descried on the hills of Mendi! We were invited to visit other places, but time did not allow of longer absence. I must not forget to mention, that the whole band of these Mendians are teetotallers. At a tavern where we stopped, Ban-na took me aside, and with a sorrowful countenance, said, 'This bad house—bar house—no good.' But the steam-boat is at the wharf, and I must close. The collections in money, on this excursion of twelve days, is about a thousand dollars, after deducting travelling expenses. More money is needed to defray the expenses of the Mendians to their native land, and to sustain their religious teachers."

Being unanimous in the desire to return to their native country, the Mendian negroes, thirty-five in number, embarked from New York for Sierra Leone, November 27, 1841, on board the barque "Gentleman," Captain Morris, accompanied by five missionaries and teachers; their stay in the United States, as Mr Sturge observes, having been of immense service to the anti-slavery cause; and there was reason to hope, that, under their auspices, Christianity and civilisation may be introduced into their native country.

A FEW WEEKS ON THE CONTINENT.

COPPET—FERNEY—FRIBURG.

One of the days which we devoted to Geneva and its environs was spent in an excursion to Coppet and Ferney, both lying within the compass of that villa-clad region on the northern borders of the lake to which I alluded in the previous article. As we designed also to visit the source of the small river Versoix, the walk was too long for the ladies; and a caleche, hired for the jaunt, carried us along, in cheerful mood, through scenes well calculated to amuse and refresh the mind. The weather was clear, and permitted us, at openings in the trees, to catch glimpses of the whitened peaks of Mont Blanc; while, on our left, the country, rising by easy gradations to the base of the Jura range of mountains, was observed to be laid out in trimly kept fields, in which an industrious peasantry were busily at work.

Coppet is a neat but rather old-fashioned village, situated close upon the lake, at a few miles from Geneva, and is visited by tourists for no other purpose than to see the house which had once been inhabited by M. Necker, and afterwards by his daughter, Madame de Staël. It is a plain mansion, of large size, quite in the style of a French chateau, standing behind the village, and environed on the north and west by some fine pleasure-grounds, suitable to the retirement of a meditative mind. We were admitted to view the grounds; but the house being at the time occupied by the family of the Duke de Broglie, was of course not open to the inspection of strangers. Within the park in front, and near the pathway in driving from Geneva, is a walled enclosure thickly planted with trees; and in this spot repose the remains of Necker and his daughter. It was pointed out to us with no small solemnity by a gossiping attendant, who prided herself on having, for the last forty years, been a domestic in the family.

And, so, here has mouldered into dust the hand which kindled the flame of revolution in France, and produced such wide-spread changes. Necker, however, neither anticipated nor desired that extraordinary political conflagration. Born at Geneva, in 1734, he rose, by diligence in commercial pursuits, to considerable local eminence as a banker and financier; and, about the year 1770, was appointed resident for the Genevese republic at the court of France. Here he distinguished himself by his writings, and was appointed controller-general. He did not possess sufficient duplicity to disguise the true state of affairs from the king or the nation; and for the freedom with which he canvassed measures, he received permission to retire from the country (1781). Necker now proceeded to Switzerland, where he purchased Coppet. The mismanagement of his successors ren-

dered it necessary to recall him to the helm of financial affairs; and returning, he advised (1788) the convocation of the states-general. This move, as is well known, accelerated the universal upbreak. In the midst of the civil commotions, he projected various plans for saving the national credit; but the moderateness of his views, and the accusation of being favourable to aristocracy, made it necessary for him to leave France to its fate, and he retired to Coppet: his death took place at Geneva in 1804. Necker appears to have been an active and acute, but not a profound, man; and he was unfortunate in falling on evil times. His wife, Susanna, a Bernese lady, possessed, it is said, a much stronger mind; she was the authoress of several able works of local importance, and figured in the best literary circles of Paris prior to the Revolution. Under the auspices of so accomplished a mother, Anna Louisa Necker, who was born at Paris in 1766, was carefully educated and introduced to the great world; and it was at the urgent request of her mother that the young lady consented to unite herself with the Baron de Staël-Holstein, Swedish ambassador at the court of Louis XVI., and with whom she never lived happily. I need here say nothing of the literary career of Madame de Staël, for no one who reads these pages can be unacquainted with it. She was warmly attached to her father, and, holding his memory in the highest veneration, she was fond of Coppet, where he had spent the latter years of his life; and at her death, in 1817, her body was removed hither, and placed in an adjoining tomb. Her daughter, the Duchess de Broglie, and her family, now inherit the property.

The country in the neighbourhood of Coppet is divided in a somewhat confused manner, undistinguishable in the map, between France and Switzerland, several projecting and detached pieces of the former country coming downward from the Jura range and approaching the circumscribed Genevese territory. Coppet is Swiss; but in driving round from it, we had occasion to cross the French lines, which are here quite arbitrary and loosely guarded, the grand barriers being judiciously placed some miles distant among the mountain passes. At the village of D'Ivoune, lying within the French territory, we had the pleasure of stopping a few hours, for the purpose of dining and walking to the source of the small river Versoix, which forms a sight of some interest to strangers. Conducted by a little lively French girl as guide, along some pleasant rural byways, and across a pretty green field, we arrived at a secluded spot shaded with trees; and here, from among the small stones on a sloping bank, the mass of water gurgled out, which immediately assumed the character of a mountain stream, and ran off to drive a mill at a short distance beneath. By the good taste of the proprietor of the domain, the scene has been much beautified by art, and pathways are cut to afford a full view of the phenomenon. Such copious springs, however, are by no means rare in the neighbourhood of the Jura, which, being a mass of calcareous stone, intermixed with softer materials easily washed away, it is not difficult for the water of mountain lakes to work for itself an outlet at a distance of many miles and a lower level. That the stream of the Versoix, which is tributary to Lake Leman, originates in this way, there cannot be a doubt.

A few miles farther on, and nearer Geneva, is the far-famed Ferney, once the abode of Voltaire, which, as a matter of course, we took in our way to the town. The house, situated at the head of an avenue of trees, and on the face of a slope commanding a noble view of the lake, is of the old villa fashion, with a dash of theatrical ornament that marks it as French. The upper floor is inhabited, and kept private; but the lower, containing three or four apartments, is public, and, in fact, is a show-place in the hands of a couple of greedy domestics. The antiquated and partly gilt furniture, faded silk hangings on the walls, the emblematic pictures, and some other fanciful objects, all remind us of the artificialities of a taste now passed away. The main object of curiosity is the bed-room of Voltaire, which is entered from the adjoining public apartment. The bed is one of the small French sort, and had been shaded by silk hangings depending from the roof; but all have been cut away, piece by piece, by relic-hunters, till only the upper part of the festooning is left. Against the wall is erected an object resembling a tall stove, of the shabbiest possible taste, designed to form a sarcophagus to hold the heart of the philosopher, and bearing the inscription—"Mes manes sont consolés, puisque mon cœur est au milieu de vous." (My manes are consoled, since my heart is in the midst of you.) Underneath is another inscription—"Son esprit est partout, et son cœur est ici." (His spirit is everywhere, and his heart is here.) Alas, for the vanity of all such balderdash! A few prints in common frames hang about on the walls, that of Franklin being the only one in which an English visiter could take any interest—the others being mostly of persons who, after fretting their hour, have passed into general oblivion.

The windows of these apartments are towards the west; and stepping out by one which opens to the ground, we find ourselves in a plantation of firs, bounded by a covered or berceau walk of elms, which had formed a favourite promenade of Voltaire, and where he composed some of his works. Openings in the closely shaven trees disclose fine glimpses of the country beneath, and the lake in the distance. On the other side of the mansion, at the head of the avenue by which we approach, is a dismal-looking edifice, shut up and falling to decay, which Voltaire erected as a church: the inscription "Deo erexit Voltaire" (Erected to God by Voltaire), which once figured upon it, is altogether gone, having disappeared in the uproar of the Revolution. Opposite the church stood a theatre, which has been completely removed.* Entertaining little respect for the being who had planned these crudities, we left Ferney without regret, and proceeded on our way to Geneva. Near the foot of the avenue, we passed through the village of Ferney, and a short way farther on crossed the boundary into Switzerland.

When the time arrived for our departure from Geneva, our arrangements were frustrated in a way we had not foreseen, but which will not be without its use if the circumstance affords a warning to others. Our intention originally was to have proceeded through Savoy into the Austrian territories, and our passport had been carefully *visé* for that purpose at Frankfort. Now, we found, by the shortening of the days, that the season was too far advanced to extend our trip in that direction, and we settled upon returning homeward through France, taking Lyons in our route. But, alas! our unfortunate passport had not the signature of the French ambassador, and that could only be obtained at Berne. This was somewhat provoking, no doubt; but in continental excursions one must submit to these annoyances, which, in the present instance, amounted to travelling nearly a hundred miles to go through a piece of mere official formality. As we were determined to be amused, whichever route we adopted, the circumstance was in the main of little moment; but the reader can easily imagine what must be the obstacles to commercial intercourse which such arrangements respecting passports present!

I need not enter into an account of our journey back to Lausanne, or of our progress thence to Berne, further than to mention, that, for the sake of variety, we adopted a route through the canton of Friburg, one of the most beautiful and fertile portions of Switzerland. The country here, as usual, consists of irregular slopes and winding valleys, overhung by lofty hills; but, as in the adjoining canton of Vaud, the land is cultivated, and as well enclosed as some of the best parts of England. Dairy-husbandry is a principal pursuit of the inhabitants of some of the more pastoral hills and vales; and although few farmers have more than three or four cows, the cheese produced—ordinarily called *Gruyere*—is reckoned as excellent in quality as that made in the largest Dutch or English dairies. This arises, I understand, from a common practice among the small farmers of clubbing and mixing their stock of milk, and each receiving a proportionate quantity of cheese at the end of the season—an ingenious plan, by which a set of comparatively poor cow-keepers can compete with wealthy capitalists, and that might not be unworthy the attention of English cottage farmers.

It is customary for tourists in Switzerland to observe, that in the Roman Catholic cantons things are conducted in a more slovenly and backward scale than in those professing the Reformed faith. I cannot say we saw any remarkable difference in these respects. One thing particularly struck us—that if the Protestant states are the most industrious and wealthy, the Roman Catholic are the most devout, and at the same time the most merry. Friburg is Roman Catholic, perhaps more intensely so than Lucerne, and this we noticed immediately on our entering it from Vaud. In different places the peasantry, who had just finished their harvests, were enjoying themselves, dancing to well-performed instrumental music. In one small village which we passed through, the scene was one of great gaiety. Along the road men were hastening to the dance, dressed in their best attire, and generally with ribbons twined round their hats; while the women were coming up in bands, decked in white or parti-coloured gowns, and singing with glee some of the songs of the country. In other quarters, preparations were making out of doors for dancing on an extensive scale. Platforms, about a foot in height, and of large dimensions, were in the course of erection, with awnings overhead to shelter the performers from the glare of the mid-day sun; and the musicians, as we passed, were busily preparing their instruments for the coming contest.

That the popular merriment, of which these were the tokens, has no great effect in impoverishing the country, was tolerably evident on our arrival in the town of Friburg, the capital of the canton. This ancient city, containing about 10,000 inhabitants, is built chiefly on an elevated ridge overhanging the left bank of the Saane, or Sarine, and partly in the hollow through which that river winds in a serpentine direction; a portion is also on the opposite or right bank. A more awkward situation for a town could scarcely be conceived; but it was chosen for its defensible position in days of feudal strife, and is still bounded on one side by walls and turrets of defence. Irregular as are the streets, and antique as are many of the buildings, there is a great air of substantiality throughout. The place swarms with ecclesiastics, belonging to different monasteries and churches; and here and there are seen a few aged nuns, in their dark dresses and white coifs, creeping about on their vocations of charity and mercy.

It was market day, and the town was literally crammed like a fair by country folk and their cars, waggons, and live stock for sale; likewise a vast array of travelling merchants with their booths for the disposal of all sorts of goods. I feel very certain there could not be fewer than six thousand strangers in the town; and among the whole—for we pushed our way hither and thither for hours, making divers inquiries and examinations—we saw nothing in the slightest degree indicative of misery or poverty of circumstances. The men were plainly but substantially dressed in the ordinary home-made-looking cloths of Switzerland; and the women, attired with great spruceness in lighter materials, were, with few exceptions, provided with large chip gipsy hats, which stuck out all round the head. The ladies were of opinion that each of these bonnets, which were finer than any thing they had ever before seen, would have sold for at least £2 in England. A considerable number of the stalls in the fair were for the sale of jewellery, lace, ribbons, and fine articles of female apparel, mostly, as far as we could judge, of native manufacture. The prices sought were in all cases higher than they would be in England; but then, the articles were substantial and worth the money. The scamping way in which many of the printed goods of England are now got up—for sale, not for use—must doubtless be sorely against them in such markets as that of Friburg. A Swiss girl knows too well the value of money to lay it out on a gown which the first visit to the tub will probably rob of its colours.

In walking about the fair, we were interested in seeing the venerable remains of a lime-tree growing in the market-place, opposite the Hotel de Ville, and whose history is associated with that of Swiss independence. According to tradition, a young native of Friburg, who had been engaged in the famous battle of Morat (June 22, 1476), keenly desirous of being the first to carry home tidings of the victory, ran the whole way, a distance of from ten to twelve miles, and with such overhaste, that, on his arrival at the market-place, he dropped with fatigue, and, barely able to shout that the Swiss were victorious, immediately expired. A twig of lime-tree, which he carried in his hand, was planted on the spot, in commemoration of the event; and there, as the story goes, is the tree into which it afterwards grew. Whatever truth there may be in the tradition, it is certain that the lime-tree bears marks of great antiquity, and has been of immense size. From a stem of nearly twenty feet in diameter, there shoot out several thick branches, very much decayed, but still in leaf; and such is the anxiety to preserve them from ruin, that they are supported by stone pillars. Around the massive trunk is an ample seat, which, on the occasion of our visit, was crowded by aged and youthful peasants in full holiday conversationé.

As a change of scene from the hilarity and bustle of the fair, we paid a visit to several churches, all of which were as usual open for the accommodation of whoever chose to enter. The most attractive of these edifices is the church of St Nicholas, a Gothic building, of apparently five or six centuries old, and adorned with some remarkably fine sculptures over the grand entrance. This church is celebrated all over Europe for its organ, which exceeds in magnitude that of Haarlem, and is not surpassed for the compass and delicacy of its tones. It is of modern construction, by Aloyse Mooser, a native of Friburg, having been erected in the place of one which was damaged by lightning in 1818. To listen to this splendid instrument a crowd of strangers is daily collected at a certain hour; and taking our place among others, we had the satisfaction of hearing some grand pieces played by the organist Voght, designed to bring out all the various qualities, from the sublime to the most tender and pathetic. We were first favoured by an imitation of a storm—thunder rolling, winds blowing and whistling, and the dashing of rain: then a softer piece, a touching melody, which combined an echo as if from a distance: now there was a mass, including the jingling of a bell: next followed an anthem full of the most glorious harmony, and interspersed, at certain pauses, with the semblance of a hymn sung by human voices. This latter performance on the *vox humana* pipes was indescribably exquisite, and showed, in a striking manner, the skill of the ingenious artist who formed the

* A French work of recent date, full of gossip about dramatists, written by a M. Fleury, affords some insight into the private theatricals of Ferney and the personal appearance of its proprietor. "Voltaire attended our rehearsals, as well as our performances, at Ferney. I can fancy I see him now, in his every-day dress, consisting of grey stockings and grey shoes—a large waistcoat of *bazin*, descending nearly to his knees—a large wig, squeezed into a little black velvet cap, turned up in front—the whole completed by a *robe-de-chambre*, likewise of *bazin*, the corners of which he would sometimes tuck into the waist-band of his small-clothes. Arrayed in this costume, any other person would have looked like a caricature; but the appearance of Voltaire, so far from suggesting any idea of the ridiculous, was calculated to command respect and interest. On ordinary occasions, when he happened to enter into conversation with any of the members of our theatrical troop, his manner was marked by good-humoured familiarity. But when he superintended our rehearsals, there was a truce with pleasantry; then he was all in all the dramatic poet; and one, too, whose correct judgment and refined taste were not to be easily satisfied. He required that every actor should enter heart and soul into his part; this earnestness of feeling he used to call dramatic probity. The observations which I heard from the lips of Voltaire, first gave me an idea of the importance which belongs to the accurate conception of a character."

structure, as well as of the performer. Reader, if you ever go to Friburg, do not on any account miss the organ; if it do not charm and leave a deep impression on your feelings, you are beyond the influence of sweet sounds.*

The grand curiosity of Friburg is its suspension-bridge, the largest and highest of the kind in the world. I wish I could convey a proper idea of this stupendous erection. The town, as I have said, is chiefly built on a ridge of ground on the left or west side of the Saane, divided from the opposite bank by a broad gulf of great depth, and at the bottom of which the river is seen winding among clusters of antique buildings, and beneath three bridges, covered as usual with brown-tiled roofs. Except by these ancient bridges, there was formerly no access to the town from the eastern bank, and the passage up or down the steep streets was a work of extreme difficulty for carriages of every description. In certain states of the weather, as much as an hour was occupied by a coach in first descending on one side and then ascending the other. I can compare the bed of the Saane at this point only to that of the Esk near Hawthornden; and the cause of deepening is in both cases the same. The banks are a soft sandstone, which in the course of ages have been worn down by the action of the water, leaving high and romantic cliffs and shelving braes, now covered with vegetation, unless where fashioned by the hand of art into pathways and commodious sites for buildings. To throw a suspension-bridge across this romantic but very inconvenient gulf, was an act of daring temerity; for the width to be spanned was nearly 300 metres, or upwards of 900 English feet, with a depth fully half as great. Many projects for the erection of stone or wooden bridges were devised, but none being suitable to the resources of the canton, they were respectively abandoned, and the design of a wood and iron suspension-bridge was finally agreed upon in 1830, and the work commenced in 1832. The person to whom the undertaking was assigned was M. Chaley, a French engineer, who agreed to complete the bridge, in all its details, for the sum of 300,000 francs, with the right of exacting a small toll upon it for the term of forty years.† The work was completed in 1834; and on the 15th of October of that year, previous to opening by the authorities of the town and canton, its powers were put to a severe test. Fifteen pieces of cannon, drawn by fifty horses, along with nearly 300 people, proceeded across it at one time, and the whole fluctuating mass afterwards separated and united at different points, in order to try it in every possible way. On the 19th, the official inauguration took place, and then about 2000 persons crossed it in grand procession, accompanied by military music. The depression and oscillation of the fabric on each of these occasions were very trifling. Since this period till the present time it has been constantly in use, in every respect answering the expectations formed of it.

The bridge is entirely of one span, and perfectly level. The roadway, which is of wood, is supported not by solid iron rods, as is usual with such fabrics, but by four cables of small iron wires, each cable being composed of 1056 wires, bound in close union by bands of wires at regular distances; the thickness of each cable may be about ten inches. At each extremity, the cables are conducted over a handsome stone pier, and thence, in a sloping direction, down into excavations in the rock, where they are fastened by blocks of masonry. The total length of the roadway is 905 feet, its elevation above the bed of the Saane 174 feet, and its breadth 28 feet; dimensions which may be compared with those of the famed Menai bridge, whose length is only 580 feet, its elevation 130 feet, and its breadth 25 feet. The whole of the operations on the bridge of Friburg were performed by Swiss artisans, and all the materials were of Swiss produce, except the wires for the suspending cables, which were imported from England.

Since the erection of this stupendous structure, another bridge of a similar character has been thrown across the Saane, about a quarter of a mile farther up the river, at a point where the cliffs are exceedingly steep, and beautifully clothed with shrubbery from the summit to the green vale below. This bridge, called the Pont de Gotteron, is suspended by only two cables, both from one side, and extends a length of 700 feet, with an elevation of 285 feet. The view from it down into the romantic and solitary glen on the one side, and towards the town and Grand Pont on the other, is exceedingly striking. The interest of the spectacle is not diminished by the consideration, that we are upon the boundary between German and French Switzerland. On the eastern side of the river, or that towards Berne, the language is altogether German, while on the west it is French. And so exact is the distinction, that each portion of population in the town, separated by this small river, speaks a language generally unknown to the other.

* The organist, I believe, does not play without receiving a fee of ten or twelve francs. On the occasion of our visit, a charge of a franc each was made by the keeper of our hotel from all who attended the performance from his house—a convenient and lucrative mode of collecting the fees from strangers. The hotel at which we resided was the Zahringer Hof, close by the Grand Pont, and I feel great pleasure in recommending it as one of the best houses in Switzerland. The landlord is a most obliging young man, who speaks English fluently.

† I gather these particulars from an account written by M. Chaley, published at Paris in 1839, under the title "Pont Suspendu de Fribourg (Suisse)." A small toll is exacted from passengers, and for the passage of carriages.

THE DIRECTOR.

The theatrical vacations are important seasons to the managers, or, as the French say, *directors*, of theatres, as well as to all who may have attached themselves to that profession. Then it is that managers run about in search of performers to be employed, and performers in quest of employing managers. To the metropolis, in general, all parties fly on such occasions, eager to have an early chance for success in their speculations. There are usually rendezvouses where transactions of this nature are completed—places which the histrionic profession hold sacred to themselves and their affairs. It is rather curious, that in Paris the gardens of the Palais-Royal should have been a spot devoted to such purposes by the continued practice of many years. Perhaps the case is altered somewhat of late years; but, in the days to which the anecdote now to be related refers, the gardens of the Palais-Royal were the meeting-place of the whole theatrical profession, and there engagements without number have been entered into by its members.

One day, in the times of the great Revolution, a young lady, of elegant figure and captivating air, was walking backwards and forwards in the Palais gardens. She was an object of observation to many of the numerous loungers around, and, among others, to a gentleman in the prime of life, of distinguished appearance, and attired with much attention to neatness. Considering the freedom of French manners, at that time in particular, it is nothing wonderful that this gentleman should have made an endeavour to enter into conversation with the lady whose figure had caught his admiring glance. She, however, drew back immediately on being accosted by him, and with a "You are in a mistake, sir," walked away from the spot. But this repulse seemed to the gentleman to be uttered in a tone not so very forbidding as to render all chance of making the fair one's acquaintance hopeless, and he was about to follow in her footsteps, when a hand was laid upon his arm. "A thousand pardons, sir," said the intermeddler; "you will excuse me for interfering in this affair; but the truth is, that it is partly my affair also."

The personage who made this remark was a man of sixty, of round figure, healthy complexion, and dressed in mournings which had seen some little service. "Pardon me, sir," continued he, "but really I am interested in this matter, and I believe my claim is the preferable one." The gentleman thus accosted made a hasty answer. "I do not understand you, sir," said he; "explain yourself, and tell me how this claim entitles you to take me by the arm, and interrupt me in any movements I choose to make." "I have been a little rude, I confess," said the elderly stranger, "but my interest is here concerned. I have observed your intentions. You wish to carry off Madame Lucile." "Is the lady who has now left us named Madame Lucile?" asked the gentleman. "Lucile Desrosiers is her name," said the other; "but why this feint? Do you imagine I have not detected you? You are a brother in trade." "Ay, how do you make that out?" answered the gentleman. "Why, it is easily enough seen," was the reply; "it was plain to me at the first glance that you were a *director*." "What!" cried the gentleman, with an air of surprise; "you found out this without knowing me? And you call me brother and colleague?" "Yes, I am Monsieur Florville, director of the theatre at Carcassone. You are a director, also; may I ask of what theatre?" "What theatre!" returned the other; "you ask of what theatre?" "Yes," said M. Florville; "why be mysterious with me? You know the gardens are full of our people just now, and your reserve would be of little avail, as I might learn in one moment who you are by making inquiries. You are new, I think, to business?" "Yes—I have just entered upon my present position," said the gentleman. "Ah! that is the reason I have never met you at our reunions," answered M. Florville; "may I inquire your name?" "Nicolas," was the reply. "Nicolas!" said the provincial director; "that is very like the name of my friend Nicolet. And what establishment have you taken in charge?" "My theatre is in Paris," answered the other. "In Paris!" cried M. Florville; "that is a serious place for your debut in directorship. And your theatre?" "I have undertaken the management of *La Republic*," said the gentleman. "Oh! that is the place once called the *Theatre Français?*" returned M. Florville; "and you will, no doubt, play there the high pieces—Corneille, Moliere, and so on. Well, there may be money to be gained there, but it is a serious undertaking for an inexperienced man. I, who now speak to you, have been thirty-six years a theatrical director, and yet I should shrink from trying such a place; though, truly, I know all the resources of a director as well as most people."

The gentlemanly stranger evidently began to like his frank companion, and the feeling was reciprocal. "I should be happy if my counsels could be of any service to you," said M. Florville. "I shall accept them with gratitude," answered the other. "It is said to be an easy matter to direct a theatre," said the provincial manager in continuation; "but I can tell any one that it requires as much talent and address as it does to manage a kingdom. The thing, indeed, is the same; there are the same factions, the same intrigues, the same difficulties every way; the scale only is different. Permit me, sir, to ask you a question. That gentleman who bowed just now to you was"——"M. Cambaceres," answered the other. "Ah! I need not ask you if he is a comedian," continued the self-satisfied Florville, after this little interruption; "it is easy to see that from his look, manner, and gait. Is he of your establishment?" "He was," answered the gentleman, "but he is not attached to us at present. He is not without talent, but he had pretensions of too high an order." "Ah! I see," said M. Florville; "but one is sometimes obliged to bow to these people. The public—the public—takes a fancy to them, and what can a director do? For example, sir, this Madame Lucile Desrosiers, whom we are both anxious about"—— "I yield her to you willingly," said the stranger. "Thank you, thank you," answered the Carcassone director; "she would not suit you at any rate. Her forte lies in the comic opera and vaudeville. In these departments she made an immense impression on the people of Carcassone some time since, and I have been compelled to make advances to her. Our engagement is not yet completed, but nearly so. I have had to make sacrifices to her, sir, great sacrifices, for she knows my position, and is most exacting; but I have only to make the best of it now; and he is a poor director who cannot turn such sacrifices to account. A concession of this kind, sir, whether in a theatre or in a state, may be made much of. The expensive engagement of Madame Lucile will give me an answer to all malcontents for the whole season to come. A dozen of other performers may be necessary to carry on well; but if I am blamed for not employing them, the answer is, 'Madame Lucile.' Improvements in scenery may be called for; I do not make them, and my apology is, 'Madame Lucile.' You see, sir, a concession of this kind may be made a most useful thing by a little address. And then, when I really wish to get rid of her, the press will do it for me when I choose."

"Ah!" said the auditor of M. Florville, "the press is a serious thing for us directors."

"All as matters are managed," said the provincial director of Carcassone; "I have but one journal at Carcassone, and I turn it any way I wish by a little adroitness. I make the managing journalist my confidant, or appear to do so. I appeal to his judgment on all occasions but those of importance, and half make him believe he is director of the theatre. Why, sir, he will do any thing for me under these circumstances. He would feel any blame cast upon me as blame to himself."

"Ay, but the public," said the other, "the public! severe judge—obstinate in its fancies, capricious, and never satisfied, let one do what they will!"

"I agree with you," said the Carcassone director; "the public is all that you say. But it has one great quality—*it pays*."

"Yes, it certainly is the paymaster, and that is something."

"That is all in all," said M. Florville; "there can neither be theatre nor government of any kind without it. Since the public pays, therefore, it is necessary, not to give them value for their money, but to give them just so much as to make them believe that one is not getting their money for nothing. Human language is so rich in words of a doubtful and double sense, that it is not difficult so to shape all your addresses to the public as to give the most magnificent anticipations, while the reality may be far below it, yet not a word of absolute untruth be discoverable in the promises made. Of course, this must not often be carried too far."

"No, certainly," said the gentleman, "else the public may be apt to make disturbances."

"Sometimes they do so, even at Carcassone," answered M. Florville; "and as you are new to the profession, I shall point out to you what I think the best mode of proceeding under such circumstances. Always have a deputy, a sub-manager, who may serve as a scape-goat to you; who may front the public ire, and bear off all the blame. This is easily managed, and will usually prove perfectly successful as regards the acquittance of yourself."

"But if the public will not be so satisfied?" asked the gentleman.

"Call in the police or the military at once," said M. Florville, with great coolness.

At this part of the discourse, M. Florville beheld Madame Lucile Desrosiers enter the gardens. "Ah! pardon me," cried he to his new acquaintance, "I see Madame Lucile, and must endeavour to complete our treaty."

"I am afraid that you are deceiving me, M. Florville," said the other, "and that your treaty with the lady is one in which the heart is concerned."

"Ah! young man," said the manager of Carcassone, "if you were as old in the profession as I am, you would not suspect me of making favourites amongst my company. Look on all alike; let all partake of your affections."

"What! all!" cried the other, "that would be too much." "Then your theatre is very large, and your company numerous," said M. Florville. "Larger than you can imagine," was the answer. "Yet I have seen the Opera before the Revolution," said the Carcassone director. "The Opera is nothing in com-

parison with the scene which I direct." "Truly! I should like to see this wonderful establishment of yours," said M. Florville.

"I shall with pleasure give you a ticket," said the stranger, "because I think I owe you something for the admirable counsels and lessons which you have given me in the art of *directing*. I shall profit, citizen Florville, by them; and I hope to have an opportunity of testifying my gratitude to you. Come to see me to-morrow morning."

"Where do you reside?" said Florville.

"At the Luxembourg," was the reply.

"Shall I ask for citizen Nicolas?" said the Carcassone director.

"Yes, for Nicolas—Nicolas Barras," returned the stranger.

"What!" cried M. Florville, "you are" ——

"Barras, THE DIRECTOR!"

[This little feuilleton affords a curious exemplification of the fact that the maxim, "All the world's a stage," is not only directly but conversely true.]

NO INQUIRY WITHOUT ITS USE.

It seems to be a necessary condition of human science, that we should learn many (apparently) useless things, in order to become acquainted with those which are of service; and as it is impossible, antecedently to experience, to know the value of our acquisitions, the only way in which mankind can secure all the advantages of knowledge is to prosecute their inquiries in every possible direction. There can be no greater impediment to the progress of science than a perpetual and anxious reference at every step to *palpable* utility. Assured that the general result will be beneficial, it is not wise to be too solicitous as to the immediate value of every individual effort. Nor is it to be forgotten, that trivial and apparently useless acquisitions are often the necessary *preparatives* to important discoveries. The labours of the antiquary, the verbal critic, the collator of mouldering manuscripts, the describer of microscopic objects (labours which may appear to many out of all proportion to the value of the result), may be preparing the way for the achievements of some splendid genius, who may combine their minute details into a magnificent system, or evolve from a multitude of particulars collected with painful toil, some general principle destined to illuminate the career of future ages. To no one, perhaps, are the labours of his predecessors, even when they are apparently trifling or unsuccessful, of more service than to the metaphysician; and he who is well acquainted with the science, can scarcely fail to perceive that many of *its inquiries are gradually converging to important results*. Unallied as they may appear to present utility, it is not hazarding much to assert, that the world must hereafter be indebted to them for the extirpation of many mischievous errors, and the correction of a great part of those loose and ill-founded opinions by which society is now pervaded.—*Essays on the Formation and Publication of Opinions.*

LORD BROUGHAM ON "GOOD BREEDING."

The same observations which were made on the arts are applicable to a certain refinement of manners, which is common to all highly-civilised states, but which, perhaps, arises in despotic countries at an earlier stage of society. This refinement is in itself of little merit or value, if, indeed, it is not rather to be accounted a defect. Its chief characteristic is luxurious indulgences of various kinds, and a politeness which consists so much in suppression of the natural feelings that it is nearly akin to falsehood. Never to say any thing that may give pain, unless where our duty requires it, is a rule of sound morals as well as good manners. But never to say any thing which those present may dislike, nay, from which they may dissent, is the rule of refined and courtly breeding. Absolute command of countenance and figure, calm, placid deportment, unbroken ease, sustained dignity, habitual smiles, indiscriminate respect, nay, the semblance of esteem or even love for every thing that approaches, and the taking a ready interest in whatever concerns every one, but showing none at all in what regards ourselves merely—these are the constituents of highly-refined and courtly manners; and these imply such an unnatural suppression of feelings, such an habitual restraint upon the emotions of every kind, such a false position of the mind at all times, as is most easily learnt under the sway and the dread of a despotic prince or his provincial representative. Accordingly, the manners of the orientals are known to be polite in an extravagant degree; while there is a want of polish in the subjects of free states which has made the roughness of a republican almost proverbial.

STEAM NAVIGATION ON THE THAMES.

There are now sixteen steam-vessels working daily between Gravesend and London; the same number to Woolwich; twenty to Greenwich; numerous small steamers, the boats of the Waterman's Company, and of the Old Woolwich Company, between Greenwich and Blackwall; there are eight steam-vessels constantly going up and down the river on their way to and from Dover, Ramsgate, Margate, Herne Bay, Southend, and Sheerness. The General Steam Navigation Company muster forty-nine first-class steamers, all sailing from London, a fleet superior to the steam fleet of any of the continental powers, and which carry merchandise and property to the amount of a million sterling weekly, and whose consumption of coal exceeds in value L.50,000 per annum. There are not less than fifty other large steamers trading between London and various parts in Great Britain and Ireland; twenty-three steam-tugs, varying from 30 to 100 horse-power each, exclusively engaged in towing ships between Gravesend and the Pool; twenty iron and wooden steamers navigating the river above bridge between London-bridge and Chelsea; two constantly running between the Adelphi pier and Putney; and five to Richmond. This is a vast amount of steam power, unequalled upon any river in the world. There is never less at any one time than 5000 persons afloat in the steamers during the summer season on the river Thames. Among the novelties lately introduced in steam navigation, is a vessel with locomotive engines similar to those on a railway, working at high pressure; and the Waterman No. 7, with Stevens's patent paddles, which enter the water at an angle of 35 degrees, produce very little swell, avoid the back water thrown up by the ordinary paddles, and produce little vibration. With two or three exceptions, the steam-engines in our river vessels are worked at a low pressure, hence explosions are never heard of.—*Times newspaper.*

LINES TO HER GRANDAUGHTER.

[SOPHIA JOANNA BAILLIE.]

Beautiful baby, where art thou?
What is thy little pastime now?
Who at this moment is caressing
The fondly-loved, the first-born blessing?

Is it papa, with vigorous dancing,
Thine eyes with timid pleasure glancing,
While added bloom adorns thy cheek,
And seems of "fearful joy to speak?"
Ah! soon with pain is pleasure bought,
And early is the lesson taught!

Or seated on thy mother's knee,
Dost thou some new discovery see—
Some sight thou'st never seen before,
Some object glitt'ring on the floor,
Some little scrap of gaudy hue,
Some toy just placed within thy view?
Or do sweet sounds attract thine ear,
Some words of fondness whispered near,
Some pretty song of ancient story,
Some tale of pussy and her glory,
While thou display'st thy little store
Of knowledge and of learned lore?

Or does some latent power within
Its influence now first begin,
Excite thee with a glad surprise,
And animate thy soft blue eyes,
Urge thee to efforts strange and new,
And bring some fresh exploit to view?
Gifts from on high bestow'd on thee,
Thou heir of immortality!

Oh ye, to whom the task is given
To guide the little feet to Heaven,
Check the first step that goes astray,
And early teach them virtue's way!
Rugged sometimes may be the road
That leads to her divine abode,
And sometimes clouds may intervene,
And darken the surrounding scene,
And for a moment hope may fail,
And terrors may the soul assail:
Fear not! the haven kept in view,
And love divine will help us through;
Help us when most we see to fear,
When most we think that danger's near;
Help us when most we seem alone,
Help us with power beyond our own!

—*From a Collection of Pieces.*

WILDMAN, THE BEE-TAMER.

In the "Scots Magazine" for November 1766, the following remarkable incidents are mentioned:—

"One Mr Wildman, of Plymouth, has lately made himself famous for his command over bees. Having come to London in August last, he gave notice to Dr Templeman, secretary to the Society for the Encouragement of Arts, &c., that he would pay him a visit on Wednesday, August 27, in the afternoon, in his bee-dress. Several ladies and gentlemen, who had heard of this intended visit, were assembled at the doctor's. About five o'clock Mr Wildman came, brought through the city in a chair, his head and face almost covered with bees, and a most venerable beard of them hanging down from his chin, which rendered his appearance truly reverend. The gentlemen and ladies were soon convinced that they need not be afraid of the bees, and therefore went up familiarly to Mr Wildman, and conversed with him. After having stayed a considerable time, he gave orders to the bees to retire to their hive that was brought for them, which they immediately obeyed with the greatest precipitation.

One thing said of him is amazing, which is, that Mr Wildman, armed with his friendly bees, thinks himself defensible against the fiercest mastiffs; and actually did, at Salisbury, encounter three yard-dogs one after the other. The conditions of engagement were, that he should have notice of the dog being set at him. Accordingly, the first mastiff was let loose; and as he approached the man, two bees were detached, who immediately stung him, the one on the nose, the other on the flank: upon receiving the wounds, the dog retired very much daunted. After this, the second dog entered the lists, and was foiled with the same expedition as the first. The third dog was at last brought against the champion; but the animal, observing the ill success of his brethren, would not attempt to sustain a combat; so, in a cowardly manner, he retired with his tail between his legs. This extraordinary gentleman can tame wasps and hornets with almost the same ease as he does bees.

On an invitation from Earl Spenser, he went to his lordship's seat at Wimbleton, in Surrey, September 17, where several persons of distinction were assembled. The countess had provided three stocks of bees. The first of Mr Wildman's performances was with one hive of bees hanging on his hat, which he carried in his hand, and the hive which they came out of in the other hand; which was to convince the earl and countess that he could take honey and wax without destroying the bees. Then he returned into the room, and came out again with them hanging on his chin, with a very venerable beard. After showing them to the company, he took them out upon the grass-walk facing his lordship's window, where a table and table-cloth were immediately brought out, and he set the hive upon the table, and made the bees hive therein; then he made the bees come out again, and warm in the air, the ladies and nobility standing amongst them, and no person stung by them; he made them go on the table, and took them up by handfuls and tossed them up and down like so many peas, handling them, however, very tenderly; then made them go into their hive at the word of command. Near five o'clock in the afternoon, he exhibited again with the three swarms of bees, one on his head, one on his breast, and the other on his arm; and then went in to his lordship, who was too much indisposed to see the former experiments; the hives which the bees were taken from were carried by one of the servants. He went into the room again, and came out with them all over his head, face, and eyes, and was led blind before his lordship's window. He then begged of his lordship that he would lend him one of his horses, which was granted. He then mounted the horse, with the bees all over his head and face (except his eyes), and breast, and left arm, with a whip in his right hand; the groom then led the horse backwards and forwards by his lordship's window for some time. Mr Wildman then took the reins in his hand, and rode round the house. He then dismounted, and made the bees march upon a table, and commanded them to retire to their hive, which they accordingly did; and gave great satisfaction to the earl, the countess, and the spectators.

Mr Barnes, a gentleman near Staines, in Middlesex, having a nest of hornets at the top of the inside of a high barn, sent to Mr Wildman, and desired his assistance to destroy them. Mr Wildman went upon the business, and took a hive with him up the ladder; and upon his approach to the nest, was stung by two of the insects. But he soon qualified their resentment, and put them into a hive, and afterwards drowned them."

A BACKWOODS EDITOR.

About twenty-five years ago, when a certain western state (which we shall not name) was a territory, and with few inhabitants, a young lawyer from one of the old states emigrated thither, and settled in the town of K——. He succeeded admirably in his profession, and rose rapidly in popular favour. He had been there nearly two years, when he induced a printer to print a weekly paper, of which he was editor and proprietor. Squire S. was much pleased for a while with editing a paper. He was a man of very low stature, but he used the editorial "WE" as frequently as if there were a dozen of him, and each as big as Daniel Lambert.

Strange to say, there were at that time men in office who were not a particle more honest than they should be; a thing which probably never happened before, and never will again. Squire S. felt all the patriotism of a son of '76, and poured out grape and canister against public abuses. This soon stirred a hornet's nest about his ears; but as there was no other paper in the territory, there was no reply, and he enjoyed his warlike propensities in security.

At length, he published an article more severe and cutting, against malfeasance in office, than any that had preceded it. In fact, though pointed at no one individual in particular, it was a "scorcher."

Some three or four days afterwards, he was sitting alone in his editorial office, which was about a quarter of a mile from the printing establishment; his pen was busy with a paragraph, when his door opened without much ceremony, and in stalked a man about six feet in his stockings. He asked, "Are you S., the proprietor of this paper?" Thinking he had found a new patron, the little man, with one of his blandest smiles, answered in the affirmative. The stranger deliberately drew the last number of the paper from his pocket, and pointing to the article against rogues in office, told the affrighted editor that it was intended for "him." It was in vain that S. protested he had never heard of him before. The wrath of the visiter rose to fever heat, and from being so long restrained, boiled over with double fury. He gave the editor his choice, either to publish a humble, a *very* humble recantation, or *take a flogging on the spot*. Either alternative was wormwood; but what could he do? The enraged office-holder was twice his size, and at one blow would qualify him for an obituary notice. He agreed to retract; and as the visiter insisted upon writing the retractation himself, he sat down to his task. Squire S. made an excuse to walk to the printing office, with a promise that he would be back in season to sign it as soon as it was finished.

S. had hardly gone fifty rods, when he encountered a man who inquired where Squire S.'s office was, and if he was at home. Suspecting that he, too, was on the same errand as the other visiter, he pointed to the office, and told him he would find the editor within, writing a most abusive article against office-holders. This was enough. The eyes of the new comer flashing fire, he rushed into the office, and assailed the stranger with the epithets, "liar, scoundrel, coward;" and told him he would teach him how to write. The gentleman, supposing it was some bully sent there by the editor, sprang to his feet, and a fight ensued. The table was upset and smashed into fire-wood, the contents of a large jug of ink stood in puddles on the floor, the chairs had their legs and backs broken beyond the skill of surgery to cure them. This seemed only to inspire the combatants with still greater fury. Blow followed blow with the rapidity of lightning. First one was kicking on the floor, then the other, each taking it in turn pretty equally. The ink on the floor found its way to their faces, till both of them cut the most ludicrous figure imaginable. The noise and uproar were tremendous. The neighbours ran to the door, and exclaimed with astonishment, that two negroes were fighting in Squire S.'s office. None dared separate them. At length, completely exhausted, they ceased fighting. The circumstances of the case became known, and the next day, hardly able to sit on horseback, their heads bound up, they started homeward, convinced that they had attained very little satisfaction from their attempt. —*Louisville Advertiser.*

NUMBER 544. SATURDAY, JULY 2, 1842. PRICE 1½d.

THE EASILY CONVINCED.

ALTHOUGH the present age is, to say the least, not less remarkable than any preceding one for caution in investigating truths, whether in science or matters of fact, there is nevertheless a class of men who are far more easily satisfied about evidence, and who more readily take up with new ideas, than their neighbours. Not a newspaper do we read but there is in it some splendid discovery, in science itself or in its applications; the patent list shows how many serious attempts are made to turn these to account: all of them get patrons more or less numerous *at first* —but time passes on, and of the very small number of such things which continue to engage attention, we need scarcely speak. Most of these things look extremely well when first hit upon. They show capitally in model. The closest investigation fails to detect a source of fallacy or failure; but somehow it always turns out that, when the thing is brought to practical experiment, there is some plaguy obstruction or difficulty, not formerly dreamt of, which upsets all, and then we hear no more of the matter. The successful applications of science to economic purposes during the last age, thought to be so fertile in them, can, after all, be enumerated in a breath—steam, gas, Mackintosh, and the electrotype. We have also got one or two new sciences, as chemistry and geology; and great, no doubt, are these additions to our knowledge. But even here we have our hasty theorisers also—let the single doctrine of "scratches"* bear witness. There is, indeed, a class of minds so constituted that every novelty calculated to excite wonder, or to raise hope, is sure to catch them. These minds are not necessarily to be supposed of a weak kind, or to have a decided tendency to delusion. They are only disposed, from wishing a thing to be true, to allow it to be so upon insufficient evidence. In many cases, it would seem to them ungenerous to doubt, and therefore, being benevolent persons, they believe. Or it is that they cannot bear to spoil a thing which tells so well, by meeting it with doubts. Or, perhaps, it fulfils and makes good some vague notions long cherished by themselves. Or a good theory, or project, or new doctrine, may be a good deal like vice in Pope's well-known couplet: we grow familiar, we pity, we embrace. It was probably the same class of minds which created and gave currency to all the wondrous monkish tales of the middle ages—easiness of conception and reception of strange things being the common features of both.

The class of philosophic and scientific inquirers has only its credulous members; but the whole race of antiquaries seems marked, and to have been marked in all time, with the fatal facility of taking in new and wonderful things. No class of investigators has furnished so many warnings against rash conclusions. It was upon a real event that Scott founded the story of his Oldbuck. A worthy old gentleman, a Sir John Clerk of Penicuik, was demonstrating the features of a Roman camp, in the neighbourhood of Moffat, to an admiring circle of friends, among whom was the young novelist. "And this," said he, pointing to a mound in the centre, "was of course the *prætorium*." "Prætorium here, prætorium there," said a shepherd standing by, "I made it wi' a flaughter spade."† An anecdote to much the same purpose has recently been told. "General St Clair, about forty years since, when governor of the North-Western Territory, received a present of a strange-looking copper coin, said to have been found in a spring near Cincinnati. General St Clair was not merely a man of the world, but he was also a highly educated, accomplished gentleman, and as little liable as any other we have known to be deceived under such circumstances. But so it was; the copper coin became at once a precious medal, the work of an extinct people, and its crooked-looking characters a key to unlock the great secret of their origin and fate. We saw this treasure-trove in the possession of General St Clair at Marietta, and we were allowed, like some others, to take an impression of it in pewter, never doubting, any more than our elders in knowledge and years, that, if it was a post-diluvian work, it was at any rate contemporaneous with the renewal or discovery of the arts immediately after the dispersion. But alas for the vanity of human expectation! The original, or a copy, fell into the hands of the late Colonel Duane, who had spent a portion of his life in India, and he detected at once that it was a Hindostanee coin, worth one cent. The buffalo was transformed, without any magic wand, into a cow, and the Manitous into Vishnu and Brahma."* As another example, take the following story from Mr Laing's Tour in Sweden:—"The antiquarian world has suffered a severe shock on the subject of Runic lore the other day. At a place called Hoby, between Carshamn and Runamo, in the province of Bleking, there is a Runic inscription on a rock, noticed by Saxo Grammaticus, who tells us his contemporary, Waldimar I. of Denmark, who lived in 1160, had sent learned people to decipher it in vain. It remained 500 years unthought-of and undeciphered, when Olaus Wormius, and after him many zealous Runic antiquaries, again attempted the task; but time had not made it more intelligible, and nothing could be made of it. At last, in 1805, a Danish antiquary, M. Arendt, made a pilgrimage on foot to this enigmatical inscription; and not being able to read it, he declared it was only a *lusus naturæ*—accidental marks and scratches in the rock. This was intolerable. For nearly thirty years the antiquarian body brooded in silence over this dictum of their recreant brother. At last, in July 1833, the Royal Society of Sciences at Copenhagen sent a solemn deputation of three of its members, Professors Molbech, Magnuson, and Forchammer, to the spot; the rock was carefully examined, was found to be a mass of granite-gneiss, intersected by a vein of whinstone (or black trap), in which the marks adverted to occur; and, to the joy of all genuine antiquarian spirit, the inscription was declared to be an inscription, blended, indeed, here and there with accidental cracks and fissures, but an inscription of artificial characters; and the artist who accompanied the commission made an accurate drawing of the whole vein, and the characters traced upon it. Nothing was wanting to complete the joy of all true antiquaries, but that these characters should be deciphered. For ten long months no progress was made. Professor Magnuson, to whom the task was intrusted, could bend them into no form of intelligibility. At last, in bed, on the 22d of May, 1834, the idea struck him to try to read the inscription backwards, from right to left. The thing was done—the thing was clear—the inscription was deciphered in two hours. It is in the old northern or Icelandic tongue, and in regular alliterative verse, and must have been cut in the rock shortly previous to the battle of Braavalle, which took place in the year 680, between Harald Hildetand and Ring, kings of certain portions of Sweden:—'Hildetand received the kingdom—Gard hewed out—Ole took the oath—Oden consecrate these runes,' &c. &c. Could any thing be more satisfactory, or better established, or more clearly explained? And now, to the dismay of the antiquarian world, out steps a man of acids and alkalies, a chemist, a philosopher—in short, the great Berzelius—coolly proving beyond all doubt, in a paper in the Transactions of the Royal Society of Sciences of Stockholm, that our inscription is, after all, but a *lusus naturæ*, or natural marks or stains on the rock! Is not this provoking?"

Archaiological inquirers often show their besetting foible in the assigning of over-recondite origins for things, and suggesting explanations that go far beyond the mark. The reading of a Rosetta stone, to the discovery of a new language and a thousand years of heretofore unknown history, is a lucky hit, as rare as the adaptation of steam or carbureted hydrogen to common purposes. When we turn from the contemplation of the one solitary prize to the multitude of blanks, what a sad spectacle is presented! At present, it is the ancient tumuli and ruins of Central America which form the favourite problem. Some time ago, it was the round towers of Ireland. These last have been assigned to all sorts of strange, mysterious, and remote origins. A large octavo volume was written to prove them connected with Budhism. Lately, it has been stated that they are of comparatively modern date, and the accounts of the expense of building one of them have been discovered. Thus it is that the wonderers are now and then disappointed. We have seen a serious speculation tracing the leek worn by Welshmen on St David's Day to the ancient Egyptian worship. Formerly, there was a practice of carrying a buck's head in procession at St Paul's Cathedral, on the day of the commemoration of St Paul. It was fixed on a pole, and carried in front of the cross, out at the west door. This was a very remarkable-looking ceremony, and suggested the idea of an ancient Pagan custom continued by the Christian priesthood. It has been spoken of again and again in books, as a relic of the customs which obtained on the same spot, when a Roman temple stood there. The English editor of Dupré's work on the Conformity between Modern and Ancient Ceremonies, takes this view with a great deal of gravity. Now, so old a writer as Stow has clearly shown that the practice originated in no extraordinary way at a comparatively recent period. He quotes the actual deed of 1274, wherein the dean and chapter of St Paul's grant a piece of land in Essex to a Sir William Baad, on the condition of having a doe and buck brought to them annually, the latter to be produced at the time of the procession, as above described. Thus, what was thought a curious vestige of British paganism, turns out to have been only one of the quaint tenures of the middle ages. Pennant, in his Tour in Scotland, has fallen into a mistake nearly similar. He there delineates on copper, and describes in his letter-press, what he calls a small ivory image, which was found near the castle of Dunstaffnage in the Highlands. As Dunstaffnage was a palace of the early kings of Scotland, and this image represented a crowned and throned monarch, Pennant made out the latter to be a deportraiture of some Caledonian prince of a thousand years ago, and a surprising specimen of early art. Behold, however, about twenty years ago, there was found, near the ruins of an old nunnery in the Isle of Skye, a number of such images, some of which resembled that figured by Pennant, while others represented knights, castles, and other objects; in short,

* It is our misfortune to be under the necessity of marring much that we say—we will not call it wit—by explaining. We here allude to the *striæ* found upon the surfaces of rocks—of late a favourite subject of speculation amongst the geologists.

† A spade used for digging turf.

* North American Review, li. 404.

they were simply a set of chessmen, albeit of early workmanship, and made, not of ivory, but of the tooth of the sea-horse. There could therefore be no doubt that Pennant had set forth as the picture of a particular king what was neither more nor less than a chessman, and no more a particular portraiture than the figures of kings and knaves on a pack of cards.

The happy inductions of Cuvier from a single fossil bone as to the general character of the animal to which it belonged, may be said to rank with the steam-engine and the Rosetta stone — the one good hit amongst many misses. It would appear that even this eminent man was not incapable of being led too far by a wish to account for appearances. The writer of the paper in the *North American Review*, which has already been quoted, tells the following anecdote :— A learned professor, well known some years since in New York, "devoted himself with great ardour to scientific pursuits, particularly to investigations into the animal kingdom, and was singularly curious in his inquiries into all circumstances presenting any unusual features. This trait of character rendered him sometimes liable to be deceived ; but he filled his position worthily, and contributed to the progress of his favourite sciences. In one of our western excursions, we found ourselves in the country of the *gophers*, small animals which dwell principally in the earth, and which are known to naturalists under the name of *pseudostoma bursarium*. Their natural habits lead them to burrow in the ground, and they are furnished with two pouches, formed by prolongation and indentation of the skin of the cheek, by which the pouch, while it opens outwards, is contained within the jaws. The object of this strange apparatus is said to be to enable the little animal to excavate his dwelling in the sandy ground by filling his pouches with sand, and then carrying the burden to the entrance of his hole, and there depositing it by pressing his fore-paws upon his cheeks. * * At this time the animal was not much known, and we succeeded in procuring one, and gave directions that the skin should be carefully prepared for preservation. It was in the month of July, and it became necessary to turn the skin of the pouches inside out, in order that it might be effectually dried. In this position, they presented the appearance of two strange-looking projections, pushed out from the cheeks, and whose object it would have been difficult to divine. We saved these exuviæ of our *gopher*, and afterwards sent them to the naturalist to whom we have already alluded. We did not replace the inverted pouches in their proper position, never supposing for a moment that any mistake could exist respecting their natural arrangement. But so it was : the stuffed specimen was sent to Europe with the projecting appendages ; and the animal formed the subject of a memoir, we think, of Cuvier himself, to the Academy of Natural Sciences, in which this zoological stranger was described as belonging to a new species of quadrupeds, and some speculations were indulged upon his proper position and his habits of life. Soon after the journal of the scientific body, which contained this memoir, reached the United States, we met the same gentleman, who was the correspondent of Cuvier, and he informed us of the high rank which the new animal had attained, and favoured us with an inspection of the memoir in which it was described. We immediately saw and pointed out the mistake of which we had most unconsciously been the cause. The circumstances were subsequently explained, and the error corrected in the history of the proceedings of the learned naturalists of Paris. But the incident has remained impressed upon our memory, warning us that the highest acquirements may be at fault, and that we must not always surrender our confidence to the highest names."

Let us not, however, press the matter too severely against the men who give their thoughts to scientific or even to archaiological inquiry. If we search deeply into the philosophy of these mistakes, we shall find that they in many instances proceed from causes rather reflecting credit than discredit on the human mind. In all such cases, it must be observed, there is the vagueness inseparable from a want of clear knowledge. From what *is* known, perhaps only a few fragmentary and disconnected particulars, it is amazing how plausible a hypothesis is sometimes formed—perfect in itself, tallying perfectly with every ascertained particular, every thing that could be wished—except the truth. The case of the Swedish rock is at first sight ludicrous, but I, for my own part, can easily understand how such a thing might occur, without necessarily throwing ridicule on either antiquarianism or these men in particular. Let me be candid, and state a case where I was myself, though with very humble pretensions, the investigating archaiologist. The subject was a three-fourths obliterated Latin inscription in the Gothic character, which had puzzled every body. I made out a reading of it, which appeared tolerably good sense, and appropriate to the situation ; but on a second and more careful inspection of the stone, it was found that some features of the lettering were not rightly accounted for. Setting to the task again, I found reason to give up almost every part of the first reading, and adopt a second quite different in its general sense, but in which scarcely a single feature of the legend was left without a proper significance. Here were two conjectural readings, one extremely plausible, another nearly as much so, *but different*, excogitated from one inscription. This I cannot help thinking a curious mental process, somewhat analogous, perhaps, to the more dexterous and felicitous efforts at anagram-making. Of a similar character are the many various hypotheses which have been formed as to who was Junius, two or three of which have been so perfect in all respects when taken separately, that no one could well doubt—till he saw the second and the third. Some of the more mystic parts of Scripture have given a like exercise to the ingenuity of commentators. There are passages in the Apocalypse which have been explained six or eight ways by different men, and all the explanations equally plausible considered apart from the rest. There are some minds which delight in such exercises. I have heard a learned and ingenious person detail a theory which he had formed from a number of far-detached texts, showing the most unexpected typical relations amongst them, and the whole bearing most luminously upon human destiny ; which yet one could not but feel to be merely a surprising product of human cogitation, from data out of which another person would probably have made as good and plausible a result, but totally different. The making up of such imaginative textures, with the few clear points all so nicely pieced in, may not be a directly useful, yet neither is it a mean exercise of intellect. Any where but in a paper on credulity, I might have been tempted to suggest it as a new and interesting kind of proof of the power of mind over matter. How almost creative does mind appear in such a power of fashioning and accommodating dead things to its own notions !

This ductility of obscure matters, or plasticity of mind over them, shows two things—first, that the hoaxing of men of learned investigation is far less of a good joke than is generally supposed. Such hoaxes are thus shown to be easy matters, for there is evidently no phenomenon so odd and irrelative but what the vagueness of all knowledge will admit of its being brought by human ingenuity into some relation, and explained accordingly. Hoaxing in such circumstances is like tempting a child into a criminal act. It is no triumph, because it is so easy. The second thing is, that investigators can scarcely be too cautious in yielding complete conviction where exact proof is wanting. When we reflect on the great theories which have been formed respecting doubtful matters, all self-consistent, all of them weaving in and accounting for the stray facts, yet all ultimately proved to be groundless, we are almost led to doubt of every thing not mathematical. But this is not right. Belief upon the testimony readily to be had is essential to our condition here, since it is quite impossible for every one to investigate every thing for himself. Therefore, indeed, it is that there is belief.

Caution as to final approval is all that is really required. "Try all things," is, within certain limits, a good maxim in the affairs of learning. And here it is that I think the present tone of the philosophical mind in our country and age is at fault. The constant cry is, give us facts and leave hypotheses alone. But it is not possible for any human being to go on constantly collecting dry unconnected facts. We require to be allowed a little generalisation by way of *bon-bons*, to encourage us in our tasks. And is not imagination often a means of leading on to fact ? We conjecture, we seek evidence in support, and ultimately our guess becomes a truth. Therefore, I say, the forming of hypotheses is, to a certain extent, not only allowable but laudable. And thus there is a utility and a final cause for even that mocked thing, credulity. The credulous are the nurses appointed for ideas in their nonage—which, if left to the tender feelings of the cautious alone, would for certain perish of cold and hunger, before ever they had shown their first teeth. The credulous catch them and foster them, and look out for their parishes, and get them comfortably brought on to their apprenticeships. By and by, they begin to kick about for themselves, and settle into respectable and useful members of society—but no thanks to the awful doctors who never have any thing to do with the intellectual bantlings that don't come into the world properly-stamped and labelled.

POPULAR ENGLISH FESTIVALS.

MIDSUMMER DAY—THE NATIVITY OF ST JOHN THE BAPTIST.

CONSIDERING the part borne by the Baptist in the transactions on which Christianity is founded, it is not wonderful that the day set apart for the observance of his nativity (June 24) should be, in all ages and most parts of Europe, one of the most popular of religious festivals. It enjoys the greater distinction that it is considered as Midsummer Day, and therefore has inherited a number of observances from heathen times. These are now curiously mixed with those springing from Christian feelings, insomuch that it is not easy to distinguish them from the other. It is only clear, from their superstitious character, that they have been originally Pagan. To use the quaint phrase of an old translator of Scaliger, they "form the foote steps of auncient gentility ;" that is, gentilism, or heathenism.

The observances connected with the Nativity of St John commenced on the previous evening, called, as usual, the eve or vigil of the festival, or Midsummer Eve. On that evening the people were accustomed to go into the woods and break down branches of trees, which they brought to their homes, and planted over their doors, amidst great demonstrations of joy, to make good the Scripture prophecy respecting the Baptist, that many should rejoice in his birth. This custom was universal in England till the recent change in manners. In Oxford there was a speciality in the observance, of a curious nature. Within the first court of Magdalen College, from a stone pulpit at one corner, a sermon was always preached on St John's Day ; at the same time, the court was embowered with green boughs, "that the preaching might resemble that of the Baptist in the wilderness."

Towards night, materials for a fire were collected in a public place and kindled. To this the name of bonfire was given, a term of which the most rational explanation seems to be, that it was composed of contributions collected as *boons*, or gifts of social and charitable feeling. Around this fire the people danced with almost frantic mirth, the men and boys occasionally jumping through it, not to show their agility, but as a compliance with ancient custom. There can be no doubt that this leaping through the fire is one of the most ancient of all known superstitions, and is identical with that followed by Manasseh. We learn that, till a late period, the practice was followed in Ireland on St John's Eve.

It was customary in towns to keep a watch walking about during the Midsummer Night, although no such practice might prevail at the place from motives of precaution. This was done at Nottingham till the reign of Charles I. Every citizen either went himself or sent a substitute ; and an oath for the preservation of peace was duly administered to the company at their first meeting at sunset. They paraded the town in parties during the night, every person wearing a garland of flowers upon his head, additionally embellished in some instances with ribbons and jewels. In London, during the middle ages, this watch, consisting of not less than two thousand men, paraded both on this night and on the eves of St Paul's and St Peter's days. The watchmen were provided with cressets, or torches, carried in barred pots on the tops of long poles, which, added to the bonfires on the streets, must have given the town a striking appearance in an age when there was no regular street-lighting. The great came to give their countenance to this marching watch, and made it quite a pageant. A London poet, looking back from 1616, thus alludes to the scene :—

"The goodly buildings that till then did hide
Their rich array, open'd their windows wide,
Where kings, great peers, and many a noble dame,
Whose bright pearl-glittering robes did mock the flame
Of the night's burning lights, did sit to see
How every senator in his degree,
Adorn'd with shining gold and purple weeds,
And stately mounted on rich-trapped steeds,
Their guard attending, through the streets did ride,
Before their foot-bands, graced with glittering pride
Of rich-gilt arms, whose glory did present
A sunshine to the eye, as if it meant,
Among the cresset lights shot up on high,
To chase dark night for ever from the sky ;
While in the streets the sticklers to and fro,
To keep decorum, still did come and go,
Where tables set were plentifully spread,
And at each door neighbour with neighbour fed."

King Henry VIII., hearing of the marching watch, came privately, in 1510, to see it ; and was so much pleased with what he saw, that he came with Queen Catherine and a noble train to attend openly that of St Peter's Eve a few nights after. But this king, in

the latter part of his reign, thought proper to abolish the ancient custom, probably from a dread of so great a muster of armed citizens.

Some of the superstitious notions connected with St John's Eve are of a highly fanciful nature. The Irish believe that the souls of all people on this night leave their bodies, and wander to the place, by land or sea, where death shall finally separate them from the tenement of clay. It is not improbable that this notion was originally universal, and was the cause of the wide-spread custom of watching or sitting up awake on St John's night, for we may well believe that there would be a general wish to prevent the soul from going upon that somewhat dismal ramble. In England, and perhaps in other countries also, it was believed that, if any one sat up fasting all night in the church porch, he would see the spirits of those who were to die in the parish during the ensuing twelvemonths come and knock at the church door, in the order and succession in which they were to die. We can easily perceive a possible connexion between this dreary fancy and that of the soul's midnight ramble. The civic vigils just described were no doubt a result, though a more remote one, of the same idea. There is a Low Dutch proverb used by those who have been kept awake all night by troubles of any kind—"We have passed St John Baptist's night." In a book written in the seventeenth century for the instruction of a young nobleman, the author warns his pupil against certain "fearful superstitions, as to watch upon St John's evening, and the first Tuesday in the month of March, to conjure the moon, to lie upon your back, having your ears stopped with laurel leaves, and to fall asleep not thinking of God, and such like follies, all forged by the infernal Cyclops and Pluto's servants." A circumstance mentioned by Grose supports our conjecture—that to sleep on St John's Eve was thought to ensure a wandering of the spirit, while watching was regarded as conferring the power of seeing the vagrant spirits of those who slept. Amongst a company who sat up in a church porch, one fell so deeply asleep that he could not be waked. His companions afterwards averred that, whilst he was in this state, they beheld his spirit go and knock at the church door.

The same notion of a temporary liberation of the soul is perhaps at the bottom of a number of superstitious practices resembling those appropriate to Hallow-eve. It was supposed, for example, that if an unmarried woman, fasting, laid a cloth at midnight with bread and cheese, and sat down as if to eat, leaving the street-door open, the person whom she was to marry would come into the room and drink to her by bowing, after which, setting down the glass, with another bow he would retire. It was customary on this eve to gather certain plants which were supposed to have a supernatural character. The fern is one of those herbs which have their seed on the back of the leaf, so small as to escape the sight. It was concluded, according to the strange irrelative reasoning of former times, that to possess this seed not easily visible, was a means of rendering one's self invisible. Young men would go out at midnight of St John's Eve, and endeavour to catch some in a plate, but without touching the plant—an attempt rather trying to patience, and which often failed. Our Elizabethan dramatists and poets, including Shakspeare and Jonson, have many allusions to the invisibility-conferring powers of fern seed. The people also gathered on this night the rose, St John's wort, vervain, trefoil, and rue, all of which were thought to have magical properties. They set the orpine in clay upon pieces of slate or potsherd in their houses, calling it a Midsummer Man. As the stalk was found next morning to incline to the right or left, the anxious maiden knew whether her lover would prove true to her or not. Young women likewise sought for what they called pieces of coal, but in reality, certain hard, black, dead roots, often found under the living mugwort, designing to place these under their pillows, that they might dream of their lovers. Some of these foolish fancies are pleasantly strung together in the "Connoisseur," a periodical paper of the middle of the last century. "I and my two sisters tried the dumb cake together: you must know two must make it, two bake it, two break it, and the third put it under each of their pillows (but you must not speak a word all the time), and then you will dream of the man you are to have. This we did; and, to be sure, I did nothing all night but dream of Mr Blossom. The same night, exactly at twelve o'clock, I sowed hemp-seed in our backyard, and said to myself—'Hemp-seed I sow, hempseed hoe, and he that is my true love come after me and mow.' Will you believe me? I looked back and saw him as plain as eyes could see him. After that I took a clean shift and wetted it, and turned it wrong side out, and hung it to the fire upon the back of a chair; and very likely my sweetheart would have come and turned it right again (for I heard his step), but I was frightened, and could not help speaking, which broke the charm. I likewise stuck up two *Midsummer Men*, one for myself and one for him. Now, if his had died away, we should never have come together; but I assure you his blowed and turned to mine. Our maid Betty tells me, if I go backwards, without speaking a word, into the garden upon Midsummer Eve, and gather a rose, and keep it in a clean sheet of paper, without looking at it till Christmas-day, it will be as fresh as in June; and if I then stick it in my bosom, he that is to be my husband will come and take it out." So also, in a poem entitled the "Cottage Girl," published in 1786:—

> "The moss-rose that, at fall of dew,
> Ere eve its duskier curtain drew,
> Was freshly gather'd from its stem,
> She values as the ruby gem;
> And, guarded from the piercing air,
> With all an anxious lover's care,
> She bids it, for her shepherd's sake,
> Await the new-year's frolic wake,
> When, faded in its alter'd hue,
> She reads—the rustic is untrue!
> But, if it leaves the crimson paint,
> Her sickening hopes no longer faint;
> The rose upon her bosom worn,
> She meets him at the peep of morn,
> And lo! her lips with kisses prest,
> He plucks it from her panting breast."

We may suppose, from the following version of a German poem, entitled "The St. John's Wort," that precisely the same notions prevail amongst the peasant youth of that country:—

> "The young maid stole through the cottage door,
> And blush'd as she sought the plant of power:
> 'Thou silver glow-worm, oh, lend me thy light,
> I must gather the mystic St. John's wort to-night—
> The wonderful herb, whose leaf will decide
> If the coming year shall make me a bride.'
> And the glow-worm came
> With its silvery flame,
> And sparkled and shone
> Through the night of St. John,
> And soon has the young maid her love-knot tied.
>
> With noiseless tread,
> To her chamber she sped,
> Where the spectral moon her white beams shed:
> 'Bloom here, bloom here, thou plant of power,
> To deck the young bride in her bridal hour!'
> But it droop'd its head, that plant of power,
> And died the mute death of the voiceless flower;
> And a wither'd wreath on the ground it lay,
> More meet for a burial than bridal day.
>
> And when a year was past away,
> All pale on her bier the young maid lay;
> And the glow-worm came
> With its silvery flame,
> And sparkled and shone
> Through the night of St. John,
> As they closed the cold grave o'er the maid's cold clay."

Some years ago, there was exhibited before the Society of Antiquaries a ring which had been found in a ploughed field near Cawood in Yorkshire, and which appeared, from the style of its inscriptions, to be of the fifteenth century. It bore for a device *two orpine plants* joined by a true-love knot, with this motto above, "*Ma fiancée velt*," that is, My sweetheart wills, or is desirous. The stalks of the plants were bent towards each other, in token, no doubt, that the parties represented by them were to come together in marriage. The motto under the ring was "*Joye l'amour feu.*" So universal, in time as in place, are these popular notions.

The observance of St John's Day seems to have been, by a practical bull, confined mainly to the previous evening. On the day itself, we only find that the people kept their doors and beds embowered in the branches set up the night before, upon the understanding that these had a virtue in averting thunder, tempest, and all kinds of noxious physical agencies.

A SIMPLE STORY.

It is a sufficiently old saying, that the life of man rests largely on trifles, and that its serenity is more frequently interrupted by slight causes than by things which, to appearance, possess a much greater degree of importance. A look, a word, or a supposed tincture of asperity even in the tone of utterance, will sometimes produce consequences alike painful and permanent in their effects. The whole current of a life may be altered by the misinterpretation or misrepresentation of a sentence; nay, the most serious results have followed from the misplacing of a letter or a misspelt word. Of the truth of these reflections, the following little story may serve as an illustration:—

I am now a man advanced in years; and although the feelings are said to become deadened and blunted by the tear and wear of the world and its cares, yet does my mind recall, with the freshness of yesterday, events which occurred at the distance of more than a quarter of a century. In youth, I was endowed with a lively fancy and a peculiar sensitiveness of disposition, which caused me to feel keenly alive to any thing in the shape of insult or ill usage; but withal, unless I err greatly, I possessed a frank and good disposition, which led me to forgive injuries as soon as confessed.

My father was engaged in an extensive mercantile concern, requiring vigilant attention on the part of its conductor; and, in order that he might surround himself with assistants in whom he could place implicit confidence, he took my brothers and myself, in early youth, into the counting-house. Here we did our best to please, and agreed well together. We had but one sister, a gay warm-hearted girl, to whom we were all devotedly attached; and it was a pleasant thing for us on Sundays to walk to church one on each side of her, while the rest acted as a sort of body-guard behind.

At the time to which I more immediately refer, I was between eighteen and nineteen—a most susceptible period of life, when the heart overflows with affectionate impulses, attaching itself to every thing fair and good, regardless or fearless of consequences. From the tendencies of this most *impressible* age, when every new face attracts, and every kind look is taken as an indication of especial favour, serious sorrows might more often flow, were it not that nature neutralises them in part by planting in the youthful breast such a love of variety that our admiration of the beautiful is temporary and transient, shifting from object to object with ease and rapidity. A *lasting* degree of love or regard is commonly reserved for a more advanced season of life, when the passions, subservient to the maturer dictates of judgment, allow reason and prudence to have a say in matters in which their interference is of the utmost importance. This is a general truth, though my own case in some measure ran counter to it.

I have said that Sunday was a bright day for us all. It was particularly so to me; for besides enjoying the happiness of accompanying my sister to church, I found then and there attractions of a more thrilling kind; and I well remember, in my youthful ardour and enthusiasm, how I used to count the days of the week, and rejoice to think that every succeeding day brought me nearer to *the* day which "comes betwixt the Saturday and Monday." I loved the day for good and grave reasons, but for other ones also, I confess. Immediately opposite to our pew in church sat the family of an eminent merchant, whose riches, in my estimation, consisted not so much in this world's wealth, as in the possession of two beautiful daughters, distinguished, above all the other girls of the place, for elegance of person and beauty of face. Besides these natural advantages, their father's circumstances enabled them to enjoy all the aids of dress and ornament, and they were in all respects the belles of the town.

My sister was acquainted with these young ladies; and it might have been amusing to any one skilled in scrutinising causes and effects, to have watched the blush which always accompanied *my* recognition of the youngest of these provincial beauties, who did not seem altogether unconscious of the emotions she excited in her devoted but humble admirer. My sister tried often to rally me out of my partiality for Cecilia, saying that a boy like me had little to hope from the condescension of the rich merchant's daughter. But when did a *boy* ever *reflect*, while under the influence of a first love? And though girls of seventeen choose to deem young men of eighteen or nineteen mere lads, I was, in reality, older than Cecilia. Besides, I fancied the fair object of my adoration looked encouragingly on her admirer; at all events, I was willing to think so; and looking through the bright medium of Hope, and Love, and Faith (for I had dependance on all the graces), I saw nothing to disturb the happiness of the blissful present, while, for the future, I had no anticipations that partook not of the same bright hue.

At this stage of my affairs, Valentine's Day occurred. This was too favourable an opportunity to let slip, and I set myself down to compose a poetical address to Cecilia. After many efforts, and many a sleepless hour, I at length managed to compose a few verses, expressive of my admiration. My sister, I well remember, sat opposite to me at a small table while I wrote; but although I knew that she guessed the purport of my letter, I did not think fit to show it to her. I dispatched my epistle; and next morning I fancied, in the simplicity of my heart, that every one knew what I had done, and my heart throbbed with an undefinable feeling of alarm when any one addressed me. Oh! the inexpressible anxiety I experienced as to the result of my letter! Would it elicit a reply?—and of what nature would this be? At length, on the following day—an age to me—an answer came; but eager as I had been to possess myself of this important document, I could scarcely summon courage enough to break the seal. I stole away to a place where I hoped I should be unobserved, and, rallying myself on my foolish trepidation, I opened the precious billet. Who can imagine my feelings of disappointment, anguish, and shame, when I read four lines to this effect:—

> "He who aspires at writing well
> Must learn beforehand how to spell.
> Ere you again give rhymes to light,
> Go, blundering goose, and learn to write."

This severe reply came on me like a thunderbolt. My misery was fearfully complete. The idea of being told that I *could not spell*, and by Cecilia, was maddening. I could have borne any reproach *but that*. I imagined there was something inexpressibly humiliating in being told, and by *her*, that I could not *spell* the words I had used to express my passion. But it is needless to attempt to describe the overpowering weight of my affliction. I dragged myself home a saddened and broken-spirited creature, with only one idea possessing my mind, namely, an utter abhorrence of all womankind. My despair showed how deeply, boy as I was, I had loved. As I stole to my room, I caught a sight of my sister's face, wearing, as I fancied, an expression of intense roguishness; but as I had some vague notion of every one being aware of the slight I had received, this did not strike me as at all peculiar. I passed a miserable sleepless night, and rose next morning full of strong resolves, which, on the first opportunity, I determined to put in practice. 'Twas in vain I tried to recall every word I had written in my ill-fated valentine, that I might satisfy myself where the error lay which had thus exposed me to the ridicule of Cecilia. I could make nothing of it. I wrote and re-wrote my lines again and again, hoping that my eye would detect the appearance of every distinct word, but it

would not do. The words, *as words*, were perfect; the spelling was faultless; so I had nothing for it but to smother my chagrin in the best way I could.

During the day, I mentioned to my father, as if it had been long occupying my mind, that I thought it would be for my advantage to go to London for a time, in order that my knowledge of business might be extended. This idea did not seem at first to meet with my father's approbation; but he promised to give some consideration to the subject, and that was as much as I had hoped for on a first application.

Next day there were consultations amongst my brothers, and at last my father's consent was obtained. Thus sanctioned, I made all haste to get my arrangements completed for departing from the scene of my disgrace. In a few days I was on my way to London, accompanied by the regrets and affectionate adieus of my relations, and stocked with recommendations from my good father to a house in London with whom he had an extensive connexion.

I need not describe my feelings during my journey; but I remember I detected myself several times wondering why I was not more happy. Silly youth! the plague was in my own heart! But I flattered myself, I recollect, with the idea that my sudden departure would inflict a blow on the vain Cecilia; and, under that impression, I thought I had so far triumphed.

I was received with the most flattering attention by the gentleman to whose notice I had been consigned. He made arrangements without delay to receive me into his warehouse; but, as he was a single man, he apologised for not being able to accommodate me in his own house. I had, therefore, to look about me for a lodging, and, *domestically* speaking, was for the first time thrown upon my own resources. I engaged a lodging at no great distance from my employer's office; and when, on the first evening after my arrival, I found myself sitting in my little humble parlour, and thought of home with all its delightful associations, of its happy inmates, of the cheerful evening *they* would be enjoying, and of Cecilia, I *doubted if my triumph* was as complete as I had allowed myself to imagine. Strange to say, Cecilia was still the leading object of my thoughts. I had truly loved with all the ardour of a boy's first love.

Next day, I was installed in my new office; and the overwhelming extent of the business in which I was soon immersed partly dissipated my own sorrow. It was in the evenings, when, exhausted by the day's exertions, I sat down to recruit in my dark parlour, that I had time to think. Sometimes I accused myself of great folly in casting from me all those minor comforts which are never appreciated until withdrawn, and I longed for the familiar intercourse of my old friends. Acquaintances I might have had by the hundred in London, but there a stranger youth can seldom boast of many disinterested friends. At other times, while musing bitterly on the valentine, I felt a revival of all the feelings which had produced it. About a year after my arrival in London, I learnt, by a letter from my sister, that Cecilia's father had died suddenly of apoplexy; and that, on examination, his affairs were found to be in a state of bankruptcy! It was supposed that there would be nothing left available for his daughters, who were thus brought all at once from a position of affluence to poverty and destitution. Deeply and sincerely did I regret this sudden change of fortune on Cecilia's account; a change the more distressing, as she was ill calculated to bear up against such a calamity. I soon after heard that the two fatherless girls had left the town, and that no one knew whither they had gone. Although my heart had ceased to throb so violently as it once did at the mention of Cecilia's name, I often wished I could discover her retreat, and add to her comforts in some way or other, without allowing her to discover from whom the relief flowed. But my secret inquiries were fruitless in this respect; and all that regarded my once gay and beautiful mistress remained a mystery.

I must now pass over a few years, during which I continued, by steadily persevering in an honourable and upright course of conduct, to gain the esteem and friendship of my employer, who ultimately offered me a partnership in the concern. But I had the wish to return home, that I might give my father's establishment the benefit of the increased knowledge and experience resulting from my residence in London. London had had its usual salutary effect upon me. In the intense struggle in which every one is sure to be involved who there applies himself to business, a vain *self-esteem* cannot exist. The circumstance of being exposed to the rubs of hundreds of young fellows of proved ability, as regarded all that appeared necessary for them to know, had brought me down in my own estimation. I had found my stilts knocked from under me, and had made the desirable discovery, that I formerly knew "nothing." I had applied myself diligently to remedy these defects, devoting my leisure hours to study; and the more information I acquired, I found I had yet the more to learn.

I had been some time at home, when a friend proposed one day that I should accompany him a little way into the country to see a cousin of his, a young lady, who was on a visit to some relations, who were also his near friends. When we arrived at the place, a charming country residence, we were met, in the garden in front of the house, by the young lady alluded to. Her appearance struck me, although my fine susceptibilities had been long gone, never, I thought, to return. She was extremely slender in form, and seemed in delicate health, but there was something peculiarly interesting in her fair and even pale countenance. She appeared a fragile being, formed to cling to man for shelter and support. Her conversation pleased me much, and her mind proved to be of superior order. My friends had for some time pressed me to marry; but, although I should have felt reluctant to own that the influence of a first love still affected me, I had certainly felt very indifferent upon the subject. At the close of the evening party, however, I found myself internally concluding, that if a partner for life was to be taken, the young lady in question would form a pleasing and fitting one. It is unnecessary to dwell on this point. Though far from being an ardent lover, I felt such an attachment spring up in a short time, as led me to offer my hand to my friend's cousin. It was accepted, and we were married.

Several years of calm wedded happiness passed away after this event. My wife brought me several children; but, at last, a change came over the placid course of our existence. By degrees my wife's health gave way. I tried every possible means for restoring her, for she had proved wise, good, and affectionate; but she continued still slowly to decline in strength. It was at this time that I had occasion to visit a manufacturing town at some distance, and, for their amusement, I took my two eldest children with me. Having gone and completed my business, I prepared to return home, and was waiting for my vehicle at the door of the town inn, when a poor-looking woman passed, dressed in a faded cloak, and a miserable-looking silk bonnet. I got a glimpse of the face, and a thought struck me that it was in some way familiar to me. The woman, too, had apparently had some similar idea regarding my features, as she turned to look again, when I was almost paralysed with horror on recognising in the faded dejected being before me the once gay and beautiful Cecilia! Our recognition was simultaneous; and on my uttering her name, a deep blush passed over the sunken features, recalling something of the brilliancy of former days. She held out her hand timidly, as if doubtful whether her advances would be received. I immediately tried to recover myself, lest she should think that my astonishment arose more from her altered appearance than from simple surprise at meeting her; and having asked her to walk into the inn with me, I was soon put in possession of the particulars of her sad history.

Necessity overcame the delicacy which might otherwise have kept her silent on this occasion. Sorrow and want had subdued the once proud girl, and she wept before me. I did not then think of *my triumph*, as I was once ignorant enough to call *my own pride;* this was no time for any feeling but that of sympathy, and this I could fully bestow.

Cecilia told me that, on the death of her father, she and her sister had left the town, in the hope of finding a home with an old aunt; but they soon found that this lady could not provide for them both, as she had just enough to support herself. They therefore determined to do something for themselves. Her sister entered a house of business; but the close confinement to which she was subjected soon undermined her health, and she died. Cecilia obtained a situation as lady's maid in a family of rank, and continued to fill it for a time with comparative comfort. But her health, also, became unsettled. She had, for this cause, to leave in succession several places, until matters grew worse and worse with her. At length she was forced again to think of her old aunt; and when I saw her, she was on her way thither, unwell, and almost penniless. My heart bled to see her sad condition. I prevailed on her to take some little money, and parted with her, resolving to do yet more in behalf of one once so dear.

I had no secrets from my poor suffering wife, and narrated to her all that had occurred, on my return home, telling her of the past as well as the present. She, with her accustomed benevolence, revolved a thousand plans in her mind for assisting "my first love." I even thought that my wife took a strange care in planning out modes of help for Cecilia. I can now divine what were her kind and pure-minded feelings in doing so. About a fortnight afterwards, my wife made me pay a visit to the aunt of Cecilia, who lived at no very distant spot, and to see what could be done in the way of assistance. On being admitted to the poor lodging of the aunt and niece, I found the latter employed in sewing.

In the course of conversation, she said she had been that very morning looking through some old papers which she had preserved; and, rising up as she spoke, she took from a drawer an old worn-looking letter, and coming forward, she said, smilingly, "*This* was amongst them; do you remember it?" I opened the letter, and found it was the *identical valentine* that had at one time cost me so many bitter pangs. I replied, "Yes, I remember it;" and added, in a half jocular manner, "Ah! Cecilia, had it not been for the saucy answer you made to this very epistle, you might now have been very differently placed."

"Answer? What answer? I never replied to this letter," she said.

"Ah! you must not tell me that," said I; "you must have forgotten; you wrote me an answer, and a very severe one it was, too."

"Never!" she exclaimed, with some energy. "I can assure you that I never in my life wrote to you either good or bad, and it pains me to think that you doubt what I now state as being strictly true."

I now explained that my impression had been so strong that the reply to my unlucky valentine came from her, that she must pardon me for having felt disposed to look incredulously upon her first denial; but of course I now must acquit her of any share in the transaction, as her word was sufficient to convince me that I had been in error. I repeated the biting lines about my inability to spell; and I then, with some degree of confusion, looked over my boyish effusion, and discovered that, in spelling the word *heart*, I had left out the letter *a*, making it *hart*.

I then said, "Yet who could know of this *but you*, or some one to whom you had shown it, and who took advantage of the error to quiz me."

"No," she replied; "it was never shown by me to a human being. My own sister did not even know that I had received it."

Then it occurred to me, all at once, that *my sister* might have been the person who sent it, for I recollected that she sat opposite to me at the little table while I wrote, and as my hand was round and large, and as I did not spare the ink, she might have had no difficulty in deciphering every word. Cecilia thought this not improbable; but it was vain to say more about it then. I made some inquiries about her health and her views for her future support, and mentioned my generous wife's ideas on the subject. She heard of this kindness with gratitude and tears, but resolved to take some time to reflect on her proceedings. On my way home, the valentine affair, so unexpectedly started, recurred to my mind, and I could not help musing on the deep influence which the harsh answer had exerted on my career in life. I had been sent from home by it for a long period; it had cost me many bitter days, months, ay, even years; I had lost by it, perhaps, the woman who had gained the ardent love of my youth; and, in short, it had been one of the moving springs of my past course in life. Reflecting on these things with mingled feelings, I reached home, and, to my inexpressible grief, found my dear wife much worse—dying. She was anxiously waiting for me. I went hurriedly to her side. "Dearest Henry," said she, "I have but a short time to speak to you, and I have one important thing to say. I have thought of it long; and circumstances have lately occurred which make me hopeful of seeing my wish in the way to fulfilment ere I die. For our sweet children's sake marry again, and marry one who will be a mother to them. There *is* one who will be so. Pardon me for making secret inquiries about that person; she is gentle and good, and has known misfortune too well not to pity the motherless child. You have ever loved her. Dear Henry, it is Cecilia. Make her your wife. It is the dying request of one whom you have striven to make happy, and who would, if possible, ensure your happiness till our final reunion takes place in another world." Such, in broken language, was the wish uttered by my noble and disinterested wife. She died very soon afterwards.

Years have passed away since that period; and Cecilia sits by my side, the mother of children of her own, yet a mother, also, to those that are motherless. When applied to on the subject, my sister, now a grave matron, confessed that she had been the writer of the severe letter, having noticed my letter to be a valentine, and chanced to catch the misspelt word. Guessing my removal to London to be the result of her act, she had never dared to confess it. It is needless to draw any moral at length from this simple story. The gross impropriety of my sister's conduct is rendered obvious by its consequences. A wise over-ruling power, however, modified all in the end for the happiness of those concerned.

NOTES OF A RESIDENCE IN THE BUSH.

THIRD ARTICLE. BY A LADY.

RETURN TO THE STATION — DAIRY MANAGEMENT — ANECDOTES OF THE COUNTRY.

During my absence at Melbourne, every thing had gone on well at the station; but I soon found that Mary had been managing as she chose too long to like being again under my control. I found her almost totally changed; no one dared to find fault with her; and so far from being of any assistance to me, she became a great torment. The first act of rebellion was her refusal to wash my baby's clothes, on the plea that she was not engaged to do it, so I had to do it myself: the next was, she would not wash any one's clothes unless I cooked for two days. I wondered what her next demand would be; but what could I do?—it would have been very difficult to get another woman-servant. I had so far to humour her, that I cooked one day in the week when she had to wash. She never helped me at all with the children, although, as we had lately got a herd of cattle, I had taken the management of the dairy upon myself—except, of course, milking the cows, which is done by men; but my time was fully employed, and I often envied Mary sitting quietly in her own hut and sewing her own work. I knew well why she behaved in this manner; she wanted me to retain her as a nursery-maid only, and get a man as hut-keeper; but wages were too high for us to do that at this time. We could not get a man under L.40 a-year and his rations besides; and provisions were now exorbitant in price. Flour could not be purchased under L.80 per ton (formerly we got it for L.25), and every other thing was in proportion. This advance of prices pressed very hard upon the settlers, so that we determined to have no unnecessary expense at the station; and I really liked managing the dairy, although it was sometimes too much for me. If my baby would not sleep when I wanted him, I sometimes laid him on the grass and let him roll about while I was in the dairy; and when he tired of that, I put him in a basket and hung him at my side, as I had seen the native women do.

We were now milking twenty cows, and we sent a great deal both of butter and cheese to market; for the butter we got 2s. 2d. per lb., and for cheese 1s. 8d. Our cheese was the best that had gone to market, but there was no great demand for it; but if so, a cheese dairy would pay very well, even at a shilling per pound; and I should suppose, that as the population increases there will be a greater demand. We had a ready sale for butter, and contracted with a person to give him butter all the year at 2s. 2d. per lb. With much persuasion I got my brother to bring home some

pigs; he seemed to have a great dislike to them, but I could not bear to pour out so much skim milk on the ground every day. Our pigs got on well, and fattened on the milk and whey, and made an agreeable change in our diet. In very hot weather I made cheese when I could get rennet, as the milk did not keep well; our dairy was too small, and not cool enough. In thundery weather, I had occasionally to give all to the pigs. I have seen, when a sheep was killed in thundery weather, the whole carcass get quite black in a few hours, and become useless; we found it very difficult to keep meat in any way in summer. We had it killed always after sunset, and then cut up and salted early next morning, and put into a cask underground. I had made a good supply of mutton hams, which were found useful in hot weather; and our dairy was a great comfort and saving to us, as we could use the milk, prepared in many ways, instead of meat. The shepherds were also fond of it. We gave them no butter except on the churning day, on which occasion I sent them some for tea, which was a great treat.

Bad servants were now our chief annoyance; and it seemed of no use being at the expense of bringing good ones from home, for they soon get corrupted; but I must make an exception in favour of Mrs Clerk, the servant of Messrs Donald and Hamilton, who was the best servant I ever saw; she was always neat herself, and kept every thing neat and comfortable about the hut, and never grudged hard work; she was invaluable to her masters. We all went over one day to dine at Messrs Donald and Hamilton's; it was the only visit I ever paid in the bush, although I had many invitations. I of course took the children with me; we enjoyed ourselves very much, and remained all next day. Mrs Clerk joined her persuasions for us to do so, and told us we had not seen half the good things she could make; she spared no pains to make us comfortable, and went through her work both quickly and well, besides nursing my little boy. After this visit, I had many invitations to visit the neighbours round, which I should have liked very well, but I had too much to detain me at home.

At this time we had a very troublesome old shepherd, who was continually letting his sheep go astray. One morning, when my brother was counting them over, ninety-two were missing; the shepherd could give no account of them, but that the day before the flock had divided, but he fancied he had collected them all again. My brother James took a hurried breakfast, and went with two of our men on horseback to endeavour to track them; they returned in the evening without having seen anything of them; but James determined to go off again early next morning, and, if necessary, remain out several days. One of the men returned in two days, and brought us intelligence that they had found the sheep-track beyond Mr Campbell's station, which was fifteen miles distant; the man returned to try and get a fresh horse from some of the neighbours, but we could not get one for two days; he brought home an emu across his horse, which he had run down. He told us that my brother was out with several gentlemen, and they had a native boy with them who was famous for tracking, but who seemed sadly afraid of going among a hostile tribe of natives, and therefore was of little use. Our own man Sandy, whom we had brought from home, was a good tracker, and could see a mark when no one else could; he had tracked the sheep for nearly a mile on his hands and knees, the marks being too faint to be seen when walking or riding. Mr Alexander and Mr Colin Campbell were exceedingly kind in their assistance to my brother, and were out with him for several days. At last, after fourteen days' riding, the sheep were found a hundred and forty miles from our station. My brother and his friends had almost given up thoughts of looking any longer for them; but they rode on about a mile farther, when they saw them in a hollow, surrounded by about a hundred natives; the men had all hid themselves, having seen the party coming, and left the women and children, who ran about chattering and hiding behind the rocks. The party rode down among them, and a singular scene met their view: the ground was strewed with heads of sheep and bits of mutton, and some of the sheep were as well cut up as if done by an English butcher; the skins were pegged out on the ground, and the fat collected in little twine bags, which the women make of the bark of a tree. Fifty live sheep were enclosed within a brush fence (James said it was the best brush fence he had seen in the country), but they were very thin, the natives being too lazy to take them out to feed; they were killing and eating them up as fast as they could. The gentlemen lighted a good fire by which to watch the sheep all night; but they durst not sit within the glare of it, for fear of the natives taking aim at them, as they knew they were among the rocks, and very likely watching them, although they did not show themselves. The party slept little that night; they cooked and ate some of the mutton, and the little native boy they had to track for them, although in great fear of the other natives, devoured nearly a whole leg. They started early next morning, driving the sheep before them, and loaded with spears, tomahawks, waddies, and baskets, which they had taken from the natives. The native boy mounted a horse, saying he would not walk a step; but as he mounted, he slipped off again, and the horse started on; the little fellow caught hold of the tail, and allowed himself to be dragged on till he got a good firm hold, and then sprung on the horse's back. James said he never saw a cleverer piece of agility in a circus. On their way home they killed an emu, but they could not carry it with them, being already well loaded. When James and our shepherd Sandy came near our hut, they fired off their pistols to let us know they had found the sheep; but we did not understand the signal, and I was very much frightened. We at home had been living in great anxiety while my brother was away. I was at the station with only Mary and the children through the day, and our comfort was not much increased at night by knowing that the two old shepherds were at home; we had seen, two days before, seven wild natives run past our hut at a little distance, all naked, which gave us a great fright; I thought Mary was going into a fit. I got my pistol, which I had hanging in my room, loaded; Mary then went for hers, and we walked up and down before the hut for about an hour. My husband was at the settlement during all the anxious time we had had at the station, and he heard nothing of our loss of sheep until his return home.

Besides the occasional frights of this kind from natives, with whom it was no easy matter to be on good terms, we were at times troubled with wild dogs, which proved a very serious annoyance. These animals generally discovered themselves when they came by setting up a most piteous howl, which was the signal for sallying out in pursuit of them; for, if let alone, they would make no small havoc with the live stock. They seldom escaped. One of our sheep dogs had a most inveterate hatred to them, and he always tracked them, and often killed one of them without assistance, although they are very tenacious of life. They are more like a fox than a dog; are of a reddish-brown, and have a very thick bushy tail. When one is killed, the tail is cut off as a trophy, and hung up in the hut; the shepherds generally get five shillings from their master for every wild dog they kill. My husband saw a wild dog which was supposed to be dead; its tail was cut off, and in a few minutes it got up and began to fight again with the dogs, but it was soon overcome.

Australia, as is well known, possesses many beautiful birds, and of these we seldom wanted visiters, particularly parrots and cockatoos; but I never heard any sweet-singing bird, such as the larks and blackbirds of Scotland, and this I thought a great drawback on their elegance of plumage. Some of the birds uttered very strange sounds, as if speaking. I heard one every morning say—"Eight o'clock," and "Get up, get up;" another used to call out—"All fat, all fat;" and another was continually saying—"Potato, potato," which always put us in mind of our loss in having none, nor any other vegetables at all. Parrots are very good eating; many a parrot-pie we had; the white parrots are, I think, the best; next, the white cockatoo.

I now come to the year 1840. Provisions at this time became very high in price. Flour, as I have mentioned, was L.80 a ton, and it was scarcely to be had in a good condition; tea L.16 a chest; sugar 6d. a lb.; meat, butter, and cheese, were, unfortunately for the farmers, the only things which fell in price. We could now get only 1s. 10d. for butter, and 1s. for cheese.

Our station had now a great look of comfort about it. We had plastered the outside of our hut with mud, which made it quite close; we had windows and good doors, and a little flower garden enclosed in front; we had built a good hut for our servants, a new store, a large dairy under ground, a new woolshed, and had two large paddocks for wheat, potatoes, &c., and we had now plenty of vegetables. We had also put up a larger stack-yard, as our cattle were increasing, and a large covered shed for the calves at night; also to milk in. About five miles from the home station, we had formed an out-station for the sheep, which secured to us a large tract of land, as no new settler can come within three miles of a station. Every one thought highly of our station; and we were well off for water, having several large *water holes* (as they are always called here, but at home we should call them lakes or large ponds); and when the rains come on, these ponds are joined together in a river, which comes down very rapidly. We often had a river running past our huts, where a few minutes before I had walked over on dry land. An immense number of ducks and geese came down with the water; I have seen our man Sandy kill seven or eight at a shot just opposite the huts. We had had a good many visits from the natives lately; they were much encouraged at Mr Baillie's station, and we began not to turn them away so quickly as we used to do; but we never allowed them to sleep at the station, except one big boy, "Tom," whom we had determined to keep if he would remain, thinking he might be useful in finding stray cattle or sheep. Tom was very lazy, but he was always obliged to chop wood or do some work, else he got nothing to eat; which we found to be the only way to make the natives active.

In some of the fresh-water ponds there are found immense quantities of mussels, which the native women dive for. We often saw numbers of shells lying in heaps where the blacks had been eating them. They are also fond of a large grub found generally in the cherry and honeysuckle tree; they can tell, by knocking the tree with a stick, if any grubs are in it. When they knock the tree, they put their ear close to listen, and they open it with a tomahawk at the very spot the grubs are to be found. It is a large white grub with a black head. I know a gentleman who was tempted to taste them from seeing the natives enjoy them so much, and he said they were very good, and often ate them again. Manna falls very abundantly from the gum trees at certain seasons of the year; I think it was in March I gathered some. It is very good, and tastes like almond biscuits; it is only to be procured early in the morning, as it disappears soon after sunrise. We sometimes got some skins of the opossum and flying-squirrel, or tuan, from the natives. It was a good excuse for them to come to the station. I paid them with a piece of dress, and they were very fond of getting a red pocket-handkerchief to tie round their necks.

OCCASIONAL NOTES.

THE PENNY POSTAGE.

When the plan of a universal penny postage was proposed, we hailed it as a great boon to the country, but were very doubtful if it could be carried conveniently into execution. The experience of a year and a half has proved that it is perfectly suitable in every respect, and it may now be said to be irrevocably fixed in the affections of the people. Only on one point has it failed: the increase in the number of letters is not so great as was anticipated, and the revenue has materially suffered. But it may very properly be asked—have the Post-office authorities shown any thing like zeal in adopting those measures which would promote a larger intercourse by letters? We decidedly think not, and the public at large are of the same opinion. It seems to be a principle in Post-office economy to send as few mail bags as possible—once a-day to most places, and twice a-day to places of greater importance, being the ordinary allowance. Now, who could expect a marked increase of epistolary correspondence under such circumstances? The arrangement is quite behind the age. Society in all departments is shooting ahead; while the Post-office is in a complacent dream, as if such things as stage-coaches, steam-boats, and railways, were scarcely in existence. A railway train leaves London for the Liverpool side of the country half a dozen times a-day—how many of these carry mails? Or, take the railway from Glasgow to Edinburgh. A train leaves each end at 5, 6, 7, and 9, in the morning; 11 in the forenoon; 3 and 5 afternoon; and 7 evening. And how often is the mail taken by these eight trains? Once, at 11 forenoon; and to carry out the farce, another mail is dispatched by a coach between 9 and 10 at night. Both these times are virtually no better than one, for they are so widely asunder as nearly to meet: in point of fact, a letter cannot, without great inconvenience, be answered in any case sooner than next day. Is this common sense, or what the country has a right to expect? Is it at all reasonable that a letter should be of more difficult transmission than a human being or a parcel of goods? Yet such is actually the case. You may send a parcel several times a-day to a distant town by means of coaches, steam-boats, or railways, but seldom can you send a letter oftener than once. This is not the place to go into the question of Post-office management; but we may be excused for expressing a belief that the system in the particular referred to is extremely defective, and that until it be effectually remedied, it is needless to expect any decided increase in the quantity of letters carried, or any addition to the revenue of the country.

LOSS OF SHIPS BY BURNING.

The frequent loss of valuable ships at sea by fire originating in the hold, is deeply lamentable on the score of humanity, and an evil of serious importance to general commerce. The latest of these disasters was the total destruction of the fine ship *Georgia*, of Newcastle, an Indiaman, Captain Mitchell, on her passage from England to Calcutta. The unfortunate event took place in the early part of last April, while the vessel was in the Indian Ocean. Early in the morning, the officer of the watch noticed something burning about the ship, and supposed that one of the crew had left his candle burning, and had fallen asleep. The officer went into the forecastle to ascertain if such was the case, but found the interior apparently safe, and the lights all extinguished. On returning to the deck, he observed that the stench increased, which excited his suspicions; and he ultimately aroused the commander, Captain Mitchell, and the rest of the ship's crew, when a strict search was determined upon. On the boats being removed, and the main hatches taken off, the burning was found to proceed from the cargo, when orders were given to remove some portion of it, so as to get at the fire; the crew, however, had not proceeded far before a volume of smoke burst upon them, and shortly afterwards it became so intense, accompanied with excessive heat, that they were forced to

desist, and leave the hold, notwithstanding large quantities of water had been thrown down amongst the cargo. Captain Mitchell then had the hatches replaced, and blocked up every aperture in the ship, including the cabins, in the hope of stifling the fire; but this proved unavailing, for in about two hours the flames broke through the cabin windows, and likewise from the hatchway over the forecastle, to the terror and dismay of all on board. Captain Mitchell, who was a young man, acted with surprising fortitude. Perceiving that the destruction of the vessel was inevitable, he directed the crew to prepare themselves to leave the ship, which they immediately commenced doing, by lowering the boats, two in number, over the vessel's side. It was a most trying moment, for the sea was extremely rough, with a heavy gale of wind, and with the knowledge of their being 800 or 900 miles from land; every soul expected to meet with a watery grave.

About eight o'clock, the chief mate, with nine of the crew, left the burning vessel in the jolly-boat, and they were directly followed by Captain Mitchell and the rest of the ship's company, four in number, in the small boat. In the course of a quarter of an hour afterwards, the work of devastation had reached the masts, and she appeared embodied in one mass of flame, forming a terrible though magnificent appearance. At this critical period a vessel was observed at a distance bearing towards the ill-fated ship, and the chief mate turned round to make known the joyful intelligence to Captain Mitchell and the rest of the crew. He was horror-struck on finding that the boat had foundered, and none of them were to be seen. They rowed about in hopes of picking them up, but unfortunately none of the poor fellows ever rose after. The ship *Thomas Sparks*, which proved to be the vessel they saw bearing down to their assistance, came up alongside soon afterwards, and took the chief officer and the rest of the Georgia's crew on board, and they remained within a short distance of the burning ship until she went down, which event took place at a late hour in the afternoon. According to the newspaper accounts, the survivors were brought safely to England in May.

We have noticed this very melancholy case of conflagration at sea, in order to suggest that men of practical science should, if possible, invent some means of averting such calamities. It is evident, in every case, that the commander possesses no method of knowing the condition of the hold without actual inspection, which is either inconvenient or dangerous. Might a means not be discovered for ascertaining daily the temperature of the hold of the vessel, by lowering a thermometer through a tube at different parts of its area? Were some precaution of this nature adopted, the slightest tendency to overheating and conflagrating would certainly be discovered, and as speedily checked. We throw out this hint, however, for wiser heads than ours, trusting that the subject will meet the attention it deserves.

BIOGRAPHIC SKETCHES.

THE REV. JOHN CAMPBELL.

Mr Thomas Campbell sometimes relates the following anecdote. He had bought a book from a stall in one of the suburbs of London, and, on mentioning his address, that it might be sent home, the man repeated the name, and then said, "Are you the *great* Mr Campbell?" The poet took a cautious course, and asked, "Whom do you mean by the *great* Mr Campbell?" "Oh, to be sure, the Mr Campbell that travelled in South Africa!" It is a good joke to those who know no Mr Campbell of much notoriety besides the author of the "Pleasures of Hope;" but the bookseller was nevertheless not far wrong in the estimate he put upon the South African missionary. Mr John Campbell was a man who never ceased to benefit his fellow-creatures throughout the whole of a long life; he was one of a few who contributed to give a good direction to a considerable portion of the public mind at a very remarkable crisis; and his productions still exert no small beneficial influence in society. What made all this the more remarkable, he possessed no high qualities of intellect, nor external advantages of any kind—he only used uncommonly well the moderate means which he did possess. In his life we have a most encouraging proof of how much good may be done with endowments of an ordinary kind, or little above ordinary, when these are entirely and conscientiously devoted to sound and right objects.

Mr Campbell was the son of a grocer in the Cowgate of Edinburgh, where he was born in 1766. His father, who was a native of Killin in Perthshire, died when he was a child, as did his mother soon after. He and two elder brothers were left, with a moderate provision, under the care of a Mr Bower, who was a manufacturer on a small scale, and the husband of his mother's sister. The young men received a classical education at the High School. From his earliest boyhood, John Campbell was fond of travelling. In the memoir of his life by Mr Philip, recently published, we are presented with some curious memoranda of his first rambles a little beyond the suburbs of Edinburgh, and the feelings which new scenes engendered in him—rambles which by and by were prolonged into little tours with his brothers to towns at the distance of forty miles, and to the Highland village which had been his father's birth-place. On Sundays, the family used to attend public worship twice, in a chapel of which Mr Bower, their uncle, was an elder, and to spend the remainder of the day in that strictly pious manner which was customary in former times in Scotland. In due time, our hero was apprenticed to a jeweller. His brothers, several years his seniors, were at that time in business for themselves—the one as a solicitor or writer, the other as an ironmonger. After the death of their uncle, they all continued to live together with Mrs Bower, and they constituted a very happy family. The simple piety of old Scottish life was the presiding spirit of the domestic scene. The two elder brothers died early, and John Campbell succeeded to the business of the ironmonger, which was carried on in a small shop at the east end of the Grassmarket. For some years he pursued this calling with diligence, devoting, however, much of his time to the perusal of pious treatises and to philanthropic objects. His religious sentiments all took the tendency of *practical good*, and therefore he engaged earnestly in the establishment of Sunday evening schools, and the communication, at all convenient opportunities, of religious instruction to those who appeared to require it. Others united in the cause; and about the year 1790, their effervescence originated a system of itinerant preaching, which greatly annoyed the established clergy, and even alarmed politicians for the tranquillity of the public mind. Mr Campbell took a part in the movement, though constitutionally a lover of quiet, and anxious to give his best attention to various religious and benevolent societies which he had originated or supported in Edinburgh. One of these was a Magdalen asylum, of which he was in a great measure the author, and which he caused to be followed up by a similar institution in Glasgow. At the same time, "he was extending his business, and multiplying his correspondence at home and abroad, and originating Sabbath schools, by letters and tracts, all over Scotland. Soldiers and sailors wrote to him for advice; the needy and greedy for money; reclaimed outcasts for prayers and counsel; dark villages for itinerants, and chapel builders for help; besides the hundreds who ordered their Missionary Magazines, books, and Scott's Commentary, and paid their accounts, through him."

"As may be supposed, Mr Campbell could not thus take the lead in new schemes of doing good without incurring censure or suspicion from some quarter. Calumny, however, never dared to breathe upon him. Nothing but his *preaching* to prisoners and the poor gave offence; and that did shock some orderly Presbyterians not a little." He was indefatigable in private efforts for the relief of distress of all kinds. As a visiter of the Destitute Sick Society, he became acquainted with a couple in reduced circumstances, who died nearly about the same time, leaving an orphan boy totally unprovided for. Mr Campbell took home the lad, and kept him for a year, when at length he succeeded in procuring for him admission to the Orphan Hospital. Kenneth Duncan there proved so good a youth, that the governors would have kept him a year longer than the usual time, for the sake of the example he set to his companions. Having served an apprenticeship to a clothier in Edinburgh, he was recommended into a counting-house in London, and there conducted himself so well, that in time he was sent out to take charge of a branch of the business at the Cape of Good Hope. Mr Campbell now lost sight of him; but, many years after, when he himself went to South Africa as a missionary, Mr Kenneth Duncan was the first person that met his eyes in approaching Cape Town, having come out in a boat to meet the vessel, the cargo of which was in reality assigned to his care. He was now an eminent merchant, married to the daughter of the chief magistrate, and living in his house. He was delighted to meet his old benefactor, whom he invited to stay with him during his residence in Cape Town. Mr Campbell did so, and enjoyed very much the effects of the grateful feelings of the poor Edinburgh boy. Many, besides Mr Duncan, had owed their support for a time to Mr Campbell. We are told that when, in 1797, Mr Newton advised him to marry, "he counted *his orphans* upon his fingers, till he proved that his family was large enough already."

When the Missionary Society was formed in London, a similar one arose in Edinburgh, of which Mr Campbell was one of the first directors. He projected, and after many difficulties effected, the bringing of a number of African boys and girls to be educated in England, in order to go back as missionaries to their own country. This led him several times to London, and his biographer gives some interesting anecdotes of the conversations which he held with his fellow-passengers in the mail-coach, with a view to their spiritual improvement—for he was one who never omitted any opportunity of, as he thought, doing good. To support the cause of missions, he originated the "Missionary Magazine" in Edinburgh, and was only prevented from undertaking the editorship by finding a better substitute. It may now be mentioned, that he was one of the first to give an impulse to the present system of addressing books specially to children, and of this class of books he was himself a successful writer. His "Worlds Displayed" is a small tome which has gone through editions numberless, and done a vast amount of good. Many similar books, written with a Franklin-like clearness and simplicity, followed the "Worlds Displayed." Throughout the whole of his life he was a great distributor of little books amongst children. According to his biographer—"The exclamation, 'Now we shall have some more nice little books, for here is Mr Campbell at the door!' is well remembered throughout all the circle of his calls. It was often heard, too, in the streets and lanes around this neighbourhood from the children at play. He was not, however, an indiscriminate or lavish distributor any where, but required some account of the contents as well as the names of what he had last given to his greedy groups, whether within doors or without."

About 1798, Mr Campbell made up his mind to abandon business, and devote himself entirely to the duty of a preacher. He had, before this time, given up a connexion with the established church, which for some years must have been sustained with difficulty. His friend Mr Haldane, who possessed a fortune which he was willing to spend in behalf of religion, had laid the foundation of an independent system, or what at first seemed such; and, for the training of young preachers to work out the scheme, a theological school had been formed at Glasgow under the charge of Mr Greville Ewing. Here Mr Campbell went through a course of study, though, from his previous accomplishments, we should suppose this to have been little necessary. Mr Haldane wished to send him as a missionary to Bengal; but he preferred labouring at home, where he thought the need for his exertions was equally great. He now began a system of itinerating over Scotland, sometimes by himself, and sometimes in company with Mr James Haldane or Mr Aikman. The brethren were looked on with great jealousy by the fixed clergy, as well as by a large portion of the public. It was a time when every novel and exciting thing was deprecated, for fear it should favour the views of anarchists, and not for years were the objects of these simply zealous preachers properly appreciated. Mr Campbell, in some of his excursions, encountered considerable personal risk, as when he crossed Loch-Fine in a disused boat, with a hole in its bottom stuffed with straw, in order to get to Greenock in time to preach there on a Sunday, all the ministers of the town being absent. The little drudging, black-complexioned man, with so much shrewdness in his head and such unction on his tongue, in time became known over the whole of Scotland, not excepting the Orkney Islands. His ready and fertile mind took advantage of every thing. Sailing once in a packet from London to Leith, he "warned the crew against the influence of bad example, by directing their attention to a vessel in the Thames, from which a herd of young bulls were all following the example of one which had leaped overboard, although it seemed drowning." "He did not," says his biographer, "acquire much science whilst a student in Glasgow, but he made a good use of what he got, and was for ever on the outlook for more. Indeed, next to the holy unction which rested upon his spirit, his habit of observing man and nature was the secret of his charm as a preacher. He had always something new to say in his own way, and fresh from the works of God. There was also a witchery in his mode of telling old and familiar things which made them seem new. In fact, he was not comfortable in the pulpit unless something hit his fancy, which he had looked at on all sides with his own eyes, and for himself. Accordingly, his preaching at Kingsland, if it never rose far above its first standard, never sunk below it, long as he was there. It was full of vivacity and originality from first to last. Every sermon might not be interesting as a whole (and none were profound, except in unction and experience), but each had something in it which could hardly be forgotten, and which all admired, and yet no one ever felt that Mr Campbell was trying to be ingenious, or that he had prepared to give effect to certain points. Indeed, no one felt that he was conscious of his finest strokes, except so far as they rebounded upon himself, and made him spring up into the 'third heaven' of devotional feeling. His oldest and constant hearers just thought and spoke of him to the last as they had done at first, and as all the neighbourhood did—that he was an *original* in the pulpit. But this never meant oddity, extravagance, or wit, in the sense of levity or rashness. It was impossible not to smile at times; but it was equally impossible to laugh at all. No one ever repeated, as a joke or a pun, any of Mr Campbell's odd sayings. During fifteen years' residence in this district, I never heard a laugh raised at his expense as a preacher, nor of any one who went to be amused by his sermons. Not one of his strange sayings is proverbial in the neighbourhood—they are either forgotten in, or associated with, the remembrance of his seriousness, spirituality, and prudence."

From January 1804, Mr Campbell was the pastor of a fixed congregation at Kingsland, near London; but, unable to rest satisfied with such duty, he every year made a tour of a few weeks or months in the country, sometimes extending his travels to the very northern extremity of Scotland. We are told that in Caithness, on one occasion, he preached once or twice every day, and three or four times on the Sabbath, his conveyances varying from a family chariot to a Shetland pony, and his residences from a laird's mansion to a hovel "in which there were, in the same apartment, three calves, one sow, some ducks, a hen and chickens, an old woman, and himself." Amongst his home duties was that of teaching a school—which was imposed upon him by necessity, his salary being

small, and all that he had ever realised by trade having been spent in works of religion and charity. In London, he took an active share in the business of the evangelical societies, and in the dissemination of religious knowledge. He started a penny religious monthly magazine for children, entitled the "Teachers' Offering," of which, in a short time, between forty and fifty thousand were sold. "This astonishing circulation the publisher rather boastingly announced on the cover. On reading it," says Mr Campbell, "I went to him, and pointing to the advertisement, said, 'There is a stick you have made to break your own head (for he was proprietor—I was only editor); and notice what I say—before six months elapse there will be six new penny magazines for children.' Exactly that number started before the six months expired. So many competitors coming into the market, of course clipped our wings considerably; but a very respectable number of subscribers continued for years."

In 1812, the London Missionary Society found it necessary to send a person of experience and high character to superintend their mission in South Africa, in place of Dr Vanderkemp, recently deceased. The society pitched upon Mr Campbell, who was now arrived at a mature period of life, but still possessed of all his early activity. With the concurrence of his flock, he proceeded to the Cape of Good Hope, and entered upon an arduous range of duties, in the course of which he traversed vast and pathless regions, where no European had ever been before; often in danger from wild beasts, savages, and lack of physical necessaries, yet never for a moment losing spirit, or slackening in his efforts to accomplish the ends of his mission. It is impossible to read even an outline of the doings and sufferings of John Campbell in Africa, without feeling, with great force, how wretched is all the greatness achieved in the ordinary ways of the world, compared with that which arises from pure well-doing towards God and man. His exertions to extend the gospel in this region were attended with a success which must be immediately traced to his singular sagacity and energy. After a stay of about eighteen months, he returned home; but in 1818, he was sent a second time to the same country, on which occasion he was also absent about two years. The volumes in which he afterwards detailed his proceedings in Africa made a deep impression on the public mind; and he was ever after, to use a common phrase, a *lion* at all public meetings for religious objects, and wherever he pleased to preach. His biographer mentions, that the African sun had added considerably to the natural darkness of his complexion. In the course of a speech at Liverpool, "he acted as well as told the surprise of the Hottentots when they first saw in him a *white* man! The joke was irresistible. We all laughed outright, and he joined us heartily, turning it off by saying, 'I have long dwelt in tents of Kedar.'"

It was not till this latter part of his life that Mr Campbell thought of taking to himself a wife: it is pleasant to record, that the step added to his happiness. As old age drew on, he itinerated less; but still, wherever he went, he was the delight of all who met him in private, and an unfailing attraction to the multitude.

After a brief period of decline, Mr Campbell died tranquilly on the 4th of April 1840, aged seventy-four, leaving behind him a name as free from reproach, and as deserving of honour, as that of any man, we seriously believe, who lived in his own time.*

CHRISTOPHER SNUB.

[From Douglas Jerrold's "Cakes and Ale."]

CHRISTOPHER was an unlucky varlet who got into all sorts of mischief, and at length was taken up on a false charge of duck-stealing, the real perpetrator being a companion, who had fled.

"It was particularly fortunate for Christopher that the assizes were near at hand: we say fortunate, for he was spared a dull, heavy season of doubt; and as he was charged with an atrocious offence, with a crime rendered more iniquitous by the late frequency of its commission, Snub was in that post of danger occupied at times by a culprit who is to be manufactured into an example. To steal a certain number of ducks is, it must be allowed, a wrong done to society; but to commit the theft after many other like robberies by other folks, is, it would seem, a still greater wrong: hence, when six pickers and stealers of ducks are merely transported, the seventh robber of the like domestic fowl shall be hanged. If it be asked, wherefore, the philosophy of the law answers —Because the thief came late into the field: had he been only the sixth robber, he had been a transported felon; being the seventh, he must be a throttled example. Now, Christopher Snub was at least the seventh. It was clear that he was born to be hanged—that is, born for an example.

Still, Christopher had a chance of escape. The great point of danger to be considered by himself and friends, was, not the wickedness of the culprit, but the judge who was to try him. If Justice Butter, a short imprisonment and whipping might be the worst; if, on the other hand, Mr Baron Sus-per-coll, then was Christopher Snub no better than an example—that is, a dead thief.

Luckless Christopher! To be sure thou wilt but fulfil thy destiny; thou wert born to be hanged, and thy execution is as good as ordered; for already, hear the trumpets! Hark! how they bray forth the dread approach of Baron Sus-per-coll!

The Baron, unlike many men of worldly fame, deserved his reputation. To hang was with him not so much a duty as a passion. Early in life he had been possessed with the solemn impulse: when at school, all his pocket-money was expended to purchase dogs and cats, to be treated according to his early principles of justice; in familiar phrase, hanged. His tree of social liberty was the tree that grew at Tyburn; the Gordian knot of policy, a nice new hempen halter. The black cap was the cap he would have always worn; he never felt so easy, warm, and truly comfortable, as when it graced his head. He could have gone to bed in it. Strange it was, that the cap, like the hidden spring in some garden statues, no sooner touched the Baron, than it drew water down his cheeks: though seemingly only a piece of stone before, Baron Sus-per-coll played from the bench on the prisoner in the dock a very fountain of sympathy. He never hanged but he cried; and, as he never lost an opportunity of hanging, we may conclude that, like ladies in hysterics, crying did him a world of good. The end of poor Baron Sus-per-coll—for he died (for a judge) at the untimely age of eighty-four, and really in the full possession of all the faculties left him—was hastened by his aqueous feelings. He had passed sentence on a miscreant, a famishing weaver, who had stolen a dish of giblets from a poulterer's, and the Baron had wept exceedingly. Unfortunately, he had come on the circuit with a new servant, and the domestic had failed to dry his lordship's ermine for the next day's business. The robe was, as usual, drenched with tears; it was the winter circuit, and the damp struck to the Baron's chest. It was plain that he was about to depart for a world which he had done all in his judicial power to render populous. Still, he rallied nobly; but happening, in the same circuit, to have a maiden assize, the unexpected blow concluded the work. With a sickly, mortal smile, Baron Sus-per-coll received the white gloves, and immediately took to his bed. For an hour or two before his death, his senses wandered; for he insisted upon having the black cap brought to his bedside, then put it upon his head, sat bolt upright, and commenced, in the most pathetic terms, passing sentence upon himself. He first began by condemning himself as an old and hardened offender; congratulated himself that he had been tried by an inflexible and enlightened jury; congratulated the country that he himself would be hanged, for he was a pest, a blot, an ulcer to society; and then conjured himself to make the most of the time that remained to him, forbidding himself to hope for the least mercy in this world, but to trust only to the mercy of the next. He then, wiping his eyes very often with the sheet, said, that nothing more remained to himself but to pass sentence upon himself; that the sentence was, that he should be taken to whence he came, and hanged by the neck until he was dead. 'And Mr Baron Sus-per-coll,' these were the Baron's last delirious words, 'may the Lord have mercy on your soul!' Saying this, the judge laid himself upon his pillow, and, the black cap still upon his head, died! To our story.

The stolen ducks, or rather the heads of some of them, had been found in the possession of Christopher Snub; the owners of the birds could swear to the property; Baron Sus-per-coll was to try the prisoner; and the prophecy of the good folks of Hempenfield was about to be fulfilled.

The trial of the prisoner approached. Kit was placed at the bar, and, confident of his innocence, looked, in the opinion of his Hempenfield neighbours, a brazen, guilty varlet. He ought to have been bent, weighed down, crushed by a sense of his iniquity, and he stood upright as a wand, and gazed about him very tranquilly. The case was opened, and very early in the trial, Mr Baron Sus-per-coll felt a certain moisture at the eyes, indicative of the coming torrent. The waters were rising—it was clear that Kit Snub was born to be hanged. The owner of the ducks was examined, to quote the report in the county paper, at 'considerable length.' The bodies of the ducks had been consumed; their fragmentary bones were found strewn on the green sward, but two heads were found entire. The witness had not the slightest doubt that such heads were the property of his late ducks; he would no more hesitate at swearing to his ducks than to his children. An outhouse had been forcibly entered, and four of the ducks carried off; the heads produced in court belonged to two of them—one to the drake, *that* he would swear. It was impossible for him to be mistaken; he had reared the ducks from the shell, had fed them every day, and would pick them out from a thousand; witness was fully aware of the solemnity of an oath, and was perfectly ready to swear to *all that*.

Mr Baron Sus-per-coll, among other antipathies, could not endure a pragmatic witness. As the owner of the ducks proceeded in his testimony, the judge felt more than ordinarily annoyed and twitted by the impudent confidence of the vulgar fellow; hence, by a sudden reversion of feeling, the baron's sympathies were quickened for the prisoner at the bar. The witness continued to speak with indecorous glibness, Baron Sus-per-coll exclaiming to himself, and sufficiently loud to be heard all over the court, 'pooh, pooh!' 'pshaw!' 'tut, tut!' 'foolish fellow!' 'how *can* he swear it?' One drake's head is like another drake's head, as one duck's egg is like another duck's egg.'

The counsel for the prosecution had finished the task, when the prisoner's counsel, who sat immediately under the bench, and had heard every syllable uttered by the judge, jumped to his feet with great alacrity. 'Stay, my good man,' said the counsel; 'let me put to you this simple question. Remember, you are upon your oath; and on your oath answer me—if one drake's head isn't like another's drake's head, as one duck's egg is like another duck's egg?'

The pen fell from the hand of Baron Sus-per-coll; his face assumed the most solemn aspect; and the silent witness, scratching his head the while, the baron slowly rose from his seat, and leaning over his desk, said to the prisoner's counsel, 'Mr Mantrap, I see the finger of heaven in this trial: the question you have so admirably, so pithily put to the witness, was at the very moment passing through my brain.' Still, the witness scratched his head: when the judge, turning from him with something like a contemptuous glance, said to the jury, 'Gentlemen, the prisoner must be discharged: there is no case.' The late prisoner readily taking the judge at his word, was for running out of the dock, when he was solemnly addressed by Mr Baron Sus-per-coll. 'Christopher Snub, you have had a most fortunate escape: whether or not you stole this good man's ducks, is the inscrutable secret of your own breast. However this may be, you owe the deepest debt of obligation to the wisdom, the forethought, the admirable sagacity of your counsel. It might have gone far otherwise with you: and when I consider the frequency of these attacks upon the sanctity of private property—when I feel the imperative call of society for some example, it becomes my painful duty'—and at these words Baron Sus-per-coll, by the mere force of custom, began to weep—'to implore you to make the most of the time allotted to you; to intreat you to lay aside all earthly hope, and to trust only for—eh?—oh! —ha! bless me, I'd forgot!'—and the baron hastily dried his streaming eyes, remembering that Christopher was not to be executed, but discharged. In an instant, all the native terrors of the judge returned, and, in a voice of thunder, Baron Sus-per-coll exclaimed to Snub, 'Fellow you have had a narrow escape; don't come here again!'"

Christopher, as the writer observes, was dismissed "with the bloom of the county jail on his name;" and, like other unhappy beings in like circumstances, was rendered an outcast of society.

LITERARY FUND DINNER.

THIS festival, which, according to annual custom, took place on the 11th of May, is described in an interesting manner in the following column from the *Inverness Courier*:—"We had yesterday a great *field day* with nobles and authors, poets and their patrons, and all that numerous class of titled and illustrious personages who court distinction among the admirers of genius. Prince Albert had consented to preside at the annual festival of the Literary Fund Society, and great was the stir in Freemason's Tavern. The attendance was nearly four hundred. The room in which the dinner took place is large and splendid, finely lighted with chandeliers, and on this occasion its galleries were graced with a number of ladies. Before six o'clock, most of the company had taken their seats. Campbell, the poet, and Sergeant Talfourd, were among the first of the stewards that joined the party, and they kept together during the evening. The former, though enjoying general good health, is evidently much touched by time and infirmity: his eye retains traces of that keen sensibility and mental energy characteristic of the poet; but his step and frame speak plainly of the ravages of threescore and four years. Talfourd is an active bustling man. About half-past six, Prince Albert, accompanied by a party of friends, entered the room. The individual next in popularity to the Prince seemed to be Tom Moore; and the moment that his bald and shining head and sparkling features were recognised, the cheers burst forth from all parts of the hall. He is an exceedingly little man, grey haired but fresh-coloured and lively, enjoying, apparently, like Falstaff, a latter spring. He has an appearance of restless and inexhaustible vivacity; and when, in the course of the evening, one of his own beautiful melodies was sung, the following verse was so like the man, and might be applied to him with such felicity and truth, that every person turned towards him with a glow of satisfaction and pleasure:—

> 'Though haply o'er some of your brows, as o'er mine,
> The snow-fall of time may be stealing, what then?
> Like Alps in the sunset, thus lighted by wine,
> We'll wear the gay tinge of youth's roses again.'

Hallam, the historian, and Washington Irving, the American writer, were also greeted with a cordial welcome. Both are simple unaffected-looking men, the accomplished American being not unlike a respectable farmer or a plain 'stout gentleman,' in a brown wig, averse to all parade and display. When the great business of dining was over, the prince gave the health of the queen, adding a few words as to the interest her majesty took in the institution. Then followed an appropriate air from the band, after which was the national anthem. The speechifying was on the whole but so-so. Many of the orators were indifferently heard, and when they did reach the ear, their observations were often commonplace, and destitute of all appearance of preparation. The following is a *verbatim* report of the terms in which Prince Albert gave the toast of the evening:—

'The toast I am now to propose is 'prosperity to this institution.' It stands unrivalled in any country, and ought to command our warmest sympathies in providing for the exigencies of those who, feeling only the promptings of genius, and forgetting every other consideration, pursue the grand career of the cultivation of the human mind, and the promotion of the arts and sciences. It is surely proper gratefully to remember the benefits we have derived from the disinterested exertions of these great and good men, and cheerfully to contribute to their want and aid their necessity. I conclude with a warm wish that the object, for the promotion of which we have met, may be answered in the most ample and generous manner. I propose, 'Prosperity to the Literary Fund.' (Cheers.)

This little speech was well delivered: the prince had plucked up courage; his manner seems always calm and subdued, but his voice was now bold and clear, and singularly harmonious. Campbell proposed the health of Henry Hallam and the historians in a *liberal* and manly little speech, in which he said that Hallam stood at the head of English historical literature. In returning thanks, the historian was inaudible to all but about a dozen people around him. Moore was rather better heard: his health was proposed by Lord Mahon in a flowery yet

* In the compilation of the above memoir, we have been chiefly indebted to the Rev. Mr Philip's "Life, Times, and Missionary Enterprises of the Rev. John Campbell" (London: Snow—1841), a book of lively interest, far beyond what would be expected by ordinary readers.

effective address. The poet's reply was short, and as his back was turned to the great body of the audience, it lost much of its effect. There were traces of his brilliant fancy in the few observations he offered; and the following passage is as completely *Moore-ish* as any of the Irish Melodies:—

'There is one reflection which cannot but arise on such an occasion, and that is, how few have been the instances, in all times and climes, of that *rara avis in terris*, a rich poet. 'Poet and rich! 'tis solecism extreme!' So sung Shenstone, the bard of the Leasowes, who was yet himself more opulent than most of his fellows; who could boast of his 'hills white over with sheep,' and his 'banks all furnished with bees;' while bards in general have quite as little to do with banks of bees as they have, God help them, with any sort of banks whatever. Of course, under the head of 'poets' I rank all great workers in the world of imagination, whether the medium through which their wonders shine upon us be prose or verse; and we have had, in our own time, one illustrious instance, where wealth seemed to spring up under the steps of the enchanter as rapidly as the successive miracles of his own matchless genius. But, alas! not even here has there been exemption from the common lot. The works themselves are for all time; but that structure of wealth which they called up, and which seemed to rise higher and higher at each new spell of the magician, has even already, I fear, vanished; adding one more to the many fulfilments of that beautiful but melancholy presage, that 'Where such fairies once have danced, no grass will ever grow.''

How true, and at the same time touching, is this allusion to the fate of Sir Walter Scott! Moore himself has been all his life a hard-working *litterateur*. Like Dogberry, he has 'had *his losses*' and his full share of the cares of the world; but his happy temperament has enabled him to bear them all with equanimity, and his poetical fancy still flows on in light and sunshine. Sergeant Talfourd spoke at some length on the subject of the drama; but it was so rapidly, and in so high a tone, that few understood what he said, and the reporters, I see, have made no attempt to transfer his 'golden thoughts' to their folio of four pages. The Marquis of Lansdowne was the most rhetorical and distinct of the speakers; and the feeling manner in which he alluded to the distresses of authors and the calamities incident to genius, was loudly applauded. Two of the *queerest* speeches were delivered by Chevalier Bunsen, the Prussian ambassador, and Baron Brunow, the Russian ambassador. The sentiments they delivered were just and liberal, but their broken English, their foreign manner and gesticulation, were so different from those around them, that it was scarcely possible not to feel ludicrous associations, or to preserve a becoming gravity. The only other person to whom the anxiety of the meeting was much turned was Washington Irving. So popular are the writings of this gentleman, and so admirably has he drawn the traits of old English character and feelings in his Sketch-book, that he is regarded by most readers with a sort of affectionate attachment, as if he were personally identified with all that is amiable, interesting, and venerable, in our national character and rural tastes. He revived the style of Addison—its higher graces, sportive gaiety, and tenderness; but added a dash of romantic feeling, derived from sympathy with the rude but eloquent tribes of Indians, the huge primeval forests, and wild traditions of his native country. When Mr Irving rose, there was an immense clapping of hands and waving of handkerchiefs. He simply, in a few words, returned thanks. There is little else to record excepting that about eleven hundred pounds were subscribed to the funds of the society, including a donation of a hundred pounds each from Prince Albert and the King of Prussia. The poor decayed authors may now rejoice in the *eclat* which has attended the anniversary of the society, since it will tend to mitigate some of those numerous ills to which they are peculiarly subject from the caprice of the public or the unavoidable reverses of fortune. The various subscriptions were read aloud by the secretary; and there was a titter round the room when he announced that the Archbishop of Dublin had assigned to them a per centage on the profits of his works. As the reverend author's calculations of these anticipated profits might be like Parson Adams's estimate of the value of his sermons (of which he reckoned every parish in England would buy a copy), the bequest was considered a very doubtful one. The archbishop, however, is an able philosophical writer, and his works are of high value. He is a fine jolly-looking churchman, and on this occasion he returned thanks for the Church in a plain and sensible speech. About half-past eleven o'clock Prince Albert took his leave, and immediately the whole party broke up, and a scrambling for hats, great-coats, &c., took place in the ante-room, in the midst of which the bustling anxiety and shrill tone of Mr Moore—half hid among big crowding men, and faithfully attended by his friend, Washington Irving, who had no American scruples as to the 'right of search'—were ludicrously conspicuous. The poet was about the last to quit the place; and then, to use his own words, 'the banquet hall was deserted.' The glittering pageant had melted into thin air, but its effects will be felt not only, as Mr Campbell eloquently remarked, 'as a token of amity between the sceptre and the free press of England,' but in soothing the distresses of those literary veterans who may be struggling with difficulty and distress."

[We observe, from an advertisement, that the committee of the Literary Fund Society has, up till the present time, distributed the sum of L.27,828 in 1985 grants to distressed authors, their widows and orphans.]

THE MANSIONS OF PARIS.

It was common in those times for many of the best and most splendid mansions in Paris to be divided amongst all the classes of society, though the arrangement of the tenants, indeed, was very different from that which existed in the social world. Lowest of all, we are told, except the rats and bottles that occupied the cellars, generally lived the proprietor of the house. He might be some avaricious or some decayed nobleman, whose health, purse, or inclination, rendered him unwilling to climb even a single flight of stairs. Then came the gay, the luxurious, the fashionable, the man of the court and of society, inhabiting the wide and lofty rooms of the first floor. The *entresol* above gave accommodation to the smart young secretary of some public office, some foreign baron, or some of the numerous counts and princes that swarm in Germany and Italian courts. The second floor received the respectable merchant, or banker, who had his offices and business in another part of the city; the widow lady, possessing affluence but not riches; and all that numerous class, by no means the least happy or the least estimable, who are known by the name of very respectable persons. Above that, again, on the third, came the highest grade of men of letters, the academician, the celebrated professor, the philosopher in vogue, the great artist. On the fourth, for there was a fourth, ay, reader, and a fifth and a sixth also—were people still at ease, and possessing all the necessaries of life, but possessing them not only with the slight inconvenience of daily climbing up long flights of stairs, but often with serious anxiety of providing for children for whom fortune had assigned no fund but the labour of a parent. Above these, again, came the poor artist, struggling forward with zeal and industry to make his merit known. The deep-thinking man of science, the result of whose investigations made or saved the fortunes of thousands, without giving him a *sous*; the moralist, the teacher, the man of letters, who disdained to pander to the bad taste of a licentious public, or to employ the arts of the quack to gain fame, or wealth, or honours. Above these, again, was want, misery, and destitution, the never-ceasing toil of all the various artists and artisans, the productions of whose hands ornamented the palace, the church, and the saloon—such men, in short, as our filigree-worker—who were brought too closely in contact with the dwellings of wealth, luxury, and vice, not to feel an additional pang amidst all the miseries of their own station, and to murmur at that social arrangement which allotted to them the whole of the dark side of life, and gave to beings often less worthy all that was bright and sunshiny. The vices of the higher class of the Parisian people, their intemperance, their debauchery, their infidelity, their contemptible frivolity, were all indulged, enacted, and displayed under the very same roofs where dwelt misery, penury, and labour; and yet they wondered that there came a revolution!—*The Ancient Regime, by G. P. R. James.*

FOSSIL PLANTS.

Fossil wood, fossil leaves, fossil bones, and fossil *infusoria*—all these things we have long heard about; but M. Goeppert, who, being a botanist, naturally seeks for flowers, has had the rare good fortune to detect the blossoms of the world before the flood. This is true to the very letter; he has gathered him a bouquet of these more than patriarchal flowers; he has seen their buds, their corollas, their propagation; nay, he has gone near to perceive their perfumes. And much more than all this: M. Goeppert has set himself to detect the mode in which nature has so wrought as to turn these most delicate of all substances into stone; thus perpetuating that which a breath of wind is sufficient to destroy, and moulding into a geological specimen what a finger's touch will fade. So patient, so sagacious is he, that he has caught the secret of this mechanism, and thus enables us to discern the transformation of the temporal to the eternal, and the metamorphosis of what is fragile into what is durable; he has actually made fossil plants! This is the man who might be expected to enter a drawing-room wearing a fossil rose like a badge in his buttonhole; and if ever such an *order of savans* be instituted, M. Goeppert is the person to be made its president. Let us cast a glance on the apartment where our Breslau professor passes many hours in meditation. There are 236 fragments of transition rocks, such as we tread upon in the Ardennes and on the banks of the Meuse; 1548 pieces of coal, similar to what you would burn any day and perceive nothing remarkable in; 35 blocks of variegated freestone, of the same kind as served to build the cathedral of Strasburg, and those churches in Mayence where M. Victor Hugo could see nothing but plaster-of-Paris monuments; 122 specimens of lias from the coasts of Britain, in which English ladies have detected real antediluvian monsters; 242 heaps of green sandstone and of chalk; 742 portions of lignite and of turf; and 259 of those small flat slabs which, on the banks of the Rhine, are employed for the purpose, when put into the hogsheads, of giving fresh spirit to wine which is a century old. Such is M. Goeppert's museum. In the coal of Silesia and of other countries, M. Goeppert has discovered and obtained several plants still flexible, and which admitted of his dissecting their epidermis and organs of evaporation; and he has thus been enabled to ascertain how subterranean combustion has destroyed the tissue in other plants found in the same formation. He detected, in the Keuper formation, the branches of a tree analogous to the birch, on which the flowers and pollen were still perfectly preserved; and some fir-trees presented him with a similar phenomena. It is well known that in the north of Europe there occasionally falls from the skies an enormous quantity of a yellow powder, which was once supposed to be sulphur, but which savans have pronounced to be the pollen of the fir-blossom. Now, in Westerwald, Finland, Bohemia, and even in New York, this floral substance has been discovered in such great quantities deposited between layers of earth, and mingled with fossil infusoria, that M. Goeppert is enabled to pronounce that the antediluvian world must have also possessed its enormous forests of gigantic pines, whose yellow dust could not but obscure in its fall the light of day, since the masses of it are so thick and close pressed as even to raise the soil many feet. We have already said that M. Goeppert makes fossil plants; and to prove how fossilisation has actually taken place, this ingenious man so works with clay, fire, and water, on a given plant (and chiefly with the ferns, those vegetables of which the geological productions of our globe present the most perfect specimens), that he produces in the course of one year, by this moist process, such samples, and so admirably imitated, that even a connoisseur, if not forewarned of the deception, might mistake them for genuine fossils. Antiquaries, we know, will sometimes manufacture fictitious medals; at Baiæ, the poorest blacksmith sells his yesterday's productions for Roman antiquities; art may imitate art, but imitation must have reached its utmost perfection when it can simulate antediluvian nature. In the cabinets of the curious we often see flies and other insects enclosed in amber. M. Goeppert has examined the amber of various lands, and has detected not only animals, but mosses, fungi, hepaticæ, ferns, flowers, and fruit, imbedded in it; and on these flowers the minutest organ is preserved, as in a mummy balm; nay, he has actually discerned those microscopic hairs which adorn the velvety substance of flowers similar to those of our heartsease.—*French Newspaper.*

CITIZENS ENNOBLED, &c.

The following notice of citizens who have been ennobled will probably be considered interesting at the present moment. John Coventry was an opulent mercer of the city of London, and mayor in 1425. From him is descended the present Earl of Coventry. Sir Stephen Brown, mayor in 1438, and again in 1448, was a grocer, and gave to us another peer, in the person of Sir Anthony Brown, created Viscount Montague by Philip and Mary in 1554. The Legges rose to be Earls of Dartmouth. The gallant sea officer George Legge was the first who was nobilitated, created Earl of Dartmouth in 1682. He was descended from one who was Lord Mayor of London in 1347, and in 1354 having, by his industry as a skinner, attained to great wealth. Sir Geoffrey Bullen, mayor in 1458, was grandfather to Thomas, Earl of Wiltshire, father of Anne Bullen, and grandfather to Queen Elizabeth, the highest genealogical honour the city ever possessed. Sir Baptist Hicks was created Viscount Campden; he was a mercer. The Capels, Earls of Essex, are descended from Sir William Capel, draper; he was Lord Mayor in 1503. Edward Osborne, cloth-worker, was Lord Mayor in 1502; he gave origin to the Dukes of Leeds. From Sir William Craven, merchant tailor, Mayor in 1661, sprung the Earl Craven. Lord Viscount Dudley and Ward is descended from William Ward, a wealthy goldsmith of London, and jeweller to Henrietta Maria, Queen of Charles I.—*Newspaper paragraph.*

NOBLE BANKERS.

Apropos of Coutts and the Duchess of St Albans, it should be added, that, a short time ago, two of the richest bankers in London were peeresses; the Duchess, namely, and the Countess of Jersey, who, as the heiress of Josiah, is still the principal partner at Child's. Both ladies were at one time said to be in the habit of paying periodical visits to their respective establishments, and to have been distinguished by the affability and good sense with which they sustained their positions, inspected the books, and entered into general details. But this report was true, and that in part only, of the late Duchess of St Albans. Her grace was certainly fond of showing herself at the bank in the Strand, and peering questions at the partners and clerks, with whom she was no favourite, being, in truth, somewhat of a bore. Lady Jersey, as the representative of Sir Josiah Child's interest, only attends the bank once a-year, when the accounts are balanced and the profits struck. On this occasion the partners dine together at the bank, and the countess, as the principal partner, takes the head of the table.—*Hardcastle's Banks and Bankers.*

LENGTH OF DAYS.

At Berlin and London, the longest day has sixteen and a half hours. At Stockholm and Upsal, the longest has eighteen and a-half hours, and the shortest five and a-half. At Hamburg, Dantzic, and Stettin, the longest day has seventeen hours, and the shortest seven. At St Petersburg and Tobolsk, the longest has nineteen, and the shortest five hours. At Torneo in Finland, the longest day has twenty-one hours and a-half, and the shortest two and a half. At Waudorbus, in Norway, the day lasts from the 21st of May to the 22d of July, without interruption; and in Spitzbergen, the longest lasts three months and a half.—*Newspaper paragraph.*

SPIRIT DRINKING.

Notwithstanding the progress of Temperance Societies, spirit drinking is not diminished, but on the increase in England. This painful fact is established by the Parliamentary Paper 238, May 6th, 1842, showing the number of gallons of British and Irish spirits that have paid duty for home consumption, in the years respectively ending October 10, 1840 and 1841. The return is as follows:—

	England.	Scotland.	Ireland.
1840, - -	8,219,657	6,124,909	8,311,634
1841, - -	8,267,891	6,000,562	6,537,364

It appears from this statement, that there is a slight decrease in Scotland, but still leaving at the rate of two gallons a-head for the whole population. We are glad to observe that the decrease is considerable in Ireland. The inference from such a document would be, that Scotland was decidedly the most intemperate of the three kingdoms; however, no just conclusion of this nature could be drawn without taking into account the number of gallons of porter and beer which was drunk in England.

TO THE READERS OF "CHAMBERS'S EDINBURGH JOURNAL."

To prevent misconception, Messrs Chambers think it necessary to state that they are no way connected with, or responsible for, the matter of any JOURNAL except that which bears the word EDINBURGH in the title. The possibility of some persons being imposed on by an imitation renders this notice necessary.

NUMBER 545. SATURDAY, JULY 9, 1842. PRICE 1½d.

APPROBATION.

To obtain praise, distinction, eclat, in some of their many forms, is unquestionably one of the most prevalent motives of human action, although, in the judgment of the moralist, a secondary one. Undoubtedly, while the value of higher motives may be fully acknowledged, this one has not been created without a wise and good purpose. At least, we may see very clearly that it daily and hourly acts beneficially, where, apparently, no higher motive would operate at all. It is, besides, one of the strongest of the social impulses, helping to make men mutually dependent, and to excite their affections towards each other. I am afraid it would be rather an unamiable world, albeit a virtuous one, where no one courted or cared for the good opinion of his neighbour.

It is necessary, however, to discriminate, by nice and rigid limits, the legitimate sphere of praise in the social scene. To be animated in all doings and sayings, all outgoings and incomings, merely by a calculation of the effect which each movement will have in securing the approbation of mortal men, would be deplorable. The conduct of any one so animated would be utter hollowness and imitation; and in the garden of his mind the hardy plants of sterling integrity and honour, to speak of nothing else, would find not one particle of congenial soil. It is even necessary to be able to act, not only without any view to the praise of men, but with the deliberate expectation of exciting their suspicion and disapprobation—for many occasions arise in life where we only can act well incurring these disadvantages. The difficulty is to know when, and how far, acting under the influence of love of approbation is allowable, and to distinguish the proper occasions when higher principle demands that that object be thrown aside. We often see individuals acting in such a way as to excite derision and blame, in matters perfectly indifferent — martyring themselves, in short, for a caprice or a chimera. Or they are so anxious to avoid the appearance of caring for the good opinion of their fellow-creatures, that they habitually, in all things, important and unimportant, take some absurd way of their own, merely because it is their own. These are follies which the considerate man holds at a distance from him. On the other hand, those who act too exclusively for praise are equally liable to both censure and ridicule. There is, in the first place, the fawning and fussy manner, the too much bowing, and smiling, and wringing of the hands, the over-eagerness to give satisfaction—all conveying the impression of a want of manliness, natural dignity, and independence. Then there is the utter inability of such a person to face any matter of principle that is unpopular, or perhaps that has *popular* support only. The perfection of conduct in this respect would be to entertain a moderate wish to stand well with the world, and to act generally with a regard to its opinion, particularly in all minor matters, and where no important principle is concerned; but to be ready, when any occasion arose, to act independently of a regard to the immediate approbation of the world.

Some persons have, from nature or the conditions in which they live, so active a love of approbation that it may almost be said to amount to a torment. It will scarcely be believed, yet I know it to be strictly true, that a man high in function and public respect was liable to be disconcerted for a day, if by chance any stranger whom he met cast what he thought a discourteous or supercilious look at him. This individual shrunk from society, for no other reason that could be observed than that he did not in general obtain that flattering attention which was necessary to put him at ease with himself. He was mistaken by half of his fellow-townsmen for a proud and distant man, when his misfortune was only the want of a self-sustaining pride. There are professions peculiarly calculated to nourish this slavish dependence on praise and admiration, particularly those which may be called artistic, as that of the painter, the literary man, and, more than all, of the actor. Love of approbation is unquestionably a powerful prompter towards these professions, so that it may be presumed of most men who adopt them, that they begin with a stock of the feeling above the average. To this the actual dependence of their status and bread on popular applause, and their constantly acting with a view to obtain it, give an unusual degree of exercise. It is thus brought to be the master-feeling of their character. They gloat upon laudatory criticisms, and sicken at a paragraph insinuating the least censure. A hiss goes to the player's heart like a death-blow; and the poet's soul, that fiery particle, is, strange to say, "snuffed out by an article." Hence that irritability of poets which has become proverbial, but which might be extended to all kinds of men who present fine intellectual productions to the public, with a view to obtaining praise. Worst of all, the excessive keenness of each man for praise to himself is very apt to raise a jealousy as to the praises bestowed on his brethren in art. Hence the dreadful wars which sometimes take place amongst musicians, the quarrels of authors, and so forth. It is painful to think of the bad feelings which have been called forth, first and last, amongst men of the highest intellectual attainments, through this cause. It is a cause which may be received as some apology to the rest of mankind for the horrible contentions of the ingenious; but the ingenious should also be aware that talents may be exerted for reasons superior even to a generous love of praise. The practice of the art itself—the high privilege of being able to excogitate fine thoughts and beautiful forms that may hap to live for ever—the sense of being able to contribute in some small degree to the improvement of mankind, or to the alleviation of the sick and weary days which many are destined to endure—may be mentioned amongst these reasons. Akenside has expressed the love of the artist (using this word in an extensive sense) for glory, in two stanzas shot like bolts straight from the heart, on hearing a sermon against that favourite object of human wishes:—

> "Come, then, tell me, sage divine,
> Is it an offence to own
> That our feelings e'er incline
> Toward immortal Glory's throne?
> For with me nor pomp nor pleasure,
> Bourbon's might, Braganza's treasure,
> So can Fancy's dream rejoice,
> To conciliate Reason's choice,
> As one approving word of her delightful voice.
>
> If to spurn at noble praise
> Be the passport to thy heaven,
> Follow thou those gloomy ways—
> No such thought to me was given;
> Nor, I trust, shall I deplore me,
> Faring like my friends before me,
> Nor a better place desire
> Than Timoleon's arms require,
> Or Tully's curule chair, or Milton's golden lyre!"

Here speaks the true poet. Such earnest and such natural feeling must everywhere meet sympathy. Yet if the divine only placed this said love of the "approving word" below some higher motives, we cannot but acknowledge, in sober reason, that he was right.

It is almost as nice a matter to know how, when, and in what measure to give praise, as to act upon the just medium with respect to looking for and receiving it. Some never give any praise: that is unamiable. Others give a great deal too much: that may be something as bad. The characters of both the party who is in the way of praising and the party who is in the way of being praised, call for consideration before we judge of either. The habit of never or rarely giving praise, even where it is due, and might do good, may proceed from a coldness of nature, and will then be justly censurable; but it may be only the result of reserved and diffident habits, in which case it is to be excused; or it may be the effect of a deliberate conviction that all praise does harm, when, of course, we must set it down as only an error in judgment. The opposite extreme of too much and too frequent praise—in short, flattery, detested as the word is—is also not to be at once and conclusively condemned. When it arises from directly interested views, or aims only at playing on a weak point in the character of a fellow creature, there is not a word to be said in arrest of judgment; but flattery sometimes proceeds from a benevolent, although it may be injudicious, wish to give pleasure; sometimes it is the genuine result of a venerative over-estimation of its object, or an exaggerated notion of the merits to which it refers. Here there may be error, but there is not ill intention; and flattery given under such circumstances is obviously a very different thing from the flattery which aims at betraying or turning into ridicule. There is also a flattery which persons of a social disposition, and who themselves love praise, give to others, in order to be on good terms with them, and obtain a good opinion and effusion of friendly sentiment in return. Here the motive is not so good, but still it is far short of the depravity of a treacherous and derisive flattery. When we are, then, the objects of flattery, or witness its being administered to others, we would require to examine and consider well the character and circumstances of the person offering it, in order to judge if the act be an offence against good morals; and if so, how far it is so. If it appear to proceed from base motives, let it be treated with open contempt; if from the wish for a return, pass it as a weakness; if from good nature or excessive veneration, excuse it for the sake of its amiable source.

But to praise or not to praise, when praise is deserved, there is the great question. It has of late been the favourite doctrine not to praise, or to praise little, as presuming that all, young and old, should be left to the approving voices of their own consciences, or the reward which good acts and performed duties are to themselves. Good-breeding also forbids all approach to direct compliment, probably because it is so apt to pass for flattery, which is so bad a thing. It is rather startling that these maxims are not consistent with much of the practice of the world. Every day we see knighthoods and peerages given for good state service. Successful authors are treated to sheets of incense in the reviews, and to public dinners at which praises are poured on their meek heads like the oil on Aaron's beard. If a policeman shows unusual cleverness in tracking out a culprit, or a preventive service boat in capturing a smuggler, or a post-captain in seizing a slaver, the virtue of the case is not left to be its own reward. Medals, prizes, and terms of honour abound in our schools; and even divines are not unwilling to receive a title to certain mystic initials showing degrees of proficiency in their sacred science. When all these things are so open and palpable, when, indeed, it is so clear that most public affairs are moved by considerations of honour to individuals, it seems a strange thing, little better, I fear, than a piece of affectation, to declare against all use of praise in private life. There is always something calling for suspicion in maxims or systems which altogether condemn

and put aside some great and conspicuous feature of human nature. This maxim as to praise bears strong marks of being of that character. Praise is confessedly a universal object, and has been so from the beginning of the world. Why should it be considered wrong to give that which every body is more or less anxious to receive? There may be something in the manner, no doubt; and yet what can be grosser in point of taste, when it is seriously reflected on, than to bring a man to a public dinner, plant him beside the chairman, open out a cascade of flattery upon him, and expect him then to rise up and task his ingenuity in at once explaining away the attributed merits, and seeming sufficiently grateful for the compliment which has been paid to him?

The true rationale of the question seems to be this: With the generality of natures, a moderate use of praise, as an incentive to duty and reward for its performance, appears to be quite proper. There is a vast class of acts and duties which, though good, are not to be accomplished and attended to without laborious exertion and some degree of self-denial. To sustain and carry out one's self in these matters, one's own approving conscience is all very well; but though a good, it is a solitary and unsocial feeling. Man dearly loves to find that he is of some consequence to man. He likes to take men along with him in his own approbation. He feels in their praise the bond of a common nature press delightfully upon his heart. How, otherwise, should we see persons in independent circumstances "shun delights and live laborious days," only, perhaps, that they may produce some literary work which will have its little hour of eclat, or possibly only a paper to be read at a meeting of twenty persons calling themselves a philosophical society? This cheap means of causing people to do what it is desirable that they should do, surely has its legitimate place in the arrangements of human society, and is capable of being used without necessarily producing harm. Perhaps there is not any one feeling of our nature which more effectually binds us together, or figures more largely in the hourly familiar pleasures of life. It is necessary, however, to study character very carefully, in order to give due praise without doing harm, and even to know how to use it for the production of positive good. A proud person requires little or none at any time. Sufficient for him is his own self-satisfaction. There are many whom praise would easily corrupt, and to whom it should therefore be sparingly administered, even when their acts are most laudable. Others, again, whose confidence in themselves is infirm, may need the administration of an occasional word of approbation to encourage them in their duties, and even to maintain the equable flow of their spirits. There is a class of such persons, who have the ability and inclination to do all that is good, but are liable to become dispirited if they do not now and then receive an encouraging word from those about them. For such persons, an occasional compliment is an aliment as necessary as daily bread. The world would to them be totally cheerless without it. Here it would evidently be as fatal to withhold praise altogether, as in other cases it would be to give it.

NORTHERN COLLIERIES.

FIRST ARTICLE.*

THE coal-field of Northumberland and Durham commences near the mouth of the river Coquet on the north, and extends nearly to the Tees on the south. As far as Shields, the sea is its boundary on the east; from that point it leaves a margin of a few miles between it and the sea, and extends about ten miles west from Newcastle. Its greatest length is fifty-eight miles, and its greatest breadth about twenty-four. Geologically speaking, the coal measures of this field repose upon the series of strata called millstone grit and shale, and in the southern portion, under the magnesian limestone, the northernmost point of which is near the mouth of the river Tyne. The beds of these measures dip towards the east, and crop out towards the west, the deposit thus assuming the form of a basin. In consequence of this disposition, the coal is in some places near the surface, while in the neighbourhood of the centre of the basin it lies at great depths. In one colliery, Jarrow, situated about five miles from the mouth of the river Tyne, one of the thickest and most valuable seams, called the High Main, is 960 feet from the surface.

The beds of these coal-measures are eighty-two in number, and consist of alternations of coal, sandstone, and slate clay, forming an aggregate thickness of 1620 feet. There are numerous obstacles in the way of a determination of the exact number of beds, or seams of coal, but it would seem that the number of workable seams is seventeen; and four or five seams are the chief sources of the best coal. The actual quantity of coal in the Newcastle coal-field does not amount to more than 4 per cent. of the whole mass of strata, of which mass various kinds of sandstone form about 36 per cent., and strata in which siliceous earth predominates about 44 per cent. It is probable that more accurate knowledge and investigation would establish the identity of several seams now differently denominated. After suitable deductions, it does not appear that the available beds exceed thirty feet in thickness at the utmost, while the principal workable seams have been averaged, by a competent authority, at twelve feet thick.

The extent of the whole surface of this coal-field it is not easy to determine; but, according to the best approximation, that of Northumberland contains 243 square miles, and that of Durham 594 square miles, making 837 square miles for the two counties. Of this, the portion already excavated is computed at 105 square miles; and from a lengthened calculation, it has been deduced, that, according to the present issue of coal from the chief ports in this field, there remains enough to satisfy our posterity for 1700 years to come. Professor Buckland, however, in 1830, limited the supply, at the existing rate of consumption and waste, to 400 years.

The "dykes," or "faults," which traverse the field are very numerous. The most important is called the Great Ninety Fathom Dyke, since the beds on the north side of it have been thrown down 90 fathoms by its intrusion, and in some instances even 170 fathoms. Your non-geological readers may not be aware of the nature of a dyke, and it will be desirable for their information to explain, that it is a considerable dislocation or interruption of the continuity of the seams of coal, sometimes caused by the intrusive interference of foreign matter, as basalt. I do not know that a better illustration of its effects can be given than by supposing some of the printed lines, in which these sentences are exhibited, to be broken and thrown up or down in the page. By an unlucky crease in the paper, we sometimes observe in the leaf of a book, that when this crease is unfolded, a white space of blank paper provokingly intervenes, vertically or obliquely, across the printed lines, and thus destroys their continuity and regularity. Now, this white space may very well represent the contents of a dyke, and the dislocation of the printed lines will indicate the up and down throw of the strata. If we suppose a dozen long consecutive lines of a broad page in a quarto book broken in half a dozen places, and so thrown up and down that a part of the fifth and sixth lines, for example, shall be thrown into juxtaposition with a part of the second and third, and so on, we shall have some idea of a series of "faults" presented by a section of the strata commencing at Sheriff Hill near Newcastle, where they are intersected by five dykes, or faults, elevating and lowering the strata, in various degrees, from ten to twenty-five fathoms. There are several kinds of dykes—as whin-dykes and basaltic-dykes. The marks of fusion near the latter are presumed to be clearly indicative of their volcanic origin. The dislocations resulting from dykes are frequently very trifling, and appropriate and significant names, chiefly local, exist for these interruptions in proportion to their extent. "Dykes" and "faults" are the terms used as expressive of the greater dislocations, and "troubles," "hitches," "slips," "baulks," &c., are the technical denominations of the different degrees of lesser, though often considerable, interruptions. The word "dyke" is radically the same as ditch, and is more correctly employed to signify the intrusion of some heterogeneous matter into the coal, sometimes without an elevation or depression of the seams. The expression "slip dyke" would be more properly used to designate such dykes as actually dislocate and raise or lower the strata; the terms dyke and fault appear to be frequently used as synonymous. These disturbers of the order of coal-seams are very important in two opposite points of view. They sometimes defeat the hopes of the capitalists who engage in sinking for coal, by throwing it down to an enormous depth; and they also sometimes confirm those hopes, by bringing within reach beds of coal which could not otherwise have been worked without a largely increased expenditure. They act, moreover, as coffer dams in stopping the passage of water, and they separate the coal into districts. They have been the preservers of many valuable seams of coal, by depressing them below the action of those causes of waste which have worn away so many outcropping strata, and denuded to so great an extent the surface of our globe.

The alteration of level occasioned by these intruders is by no means the same at all points of intersection; on the contrary, it is extremely irregular. Many of them commence with a simple crack in the roof, and progressively increase until their "throw" amounts to many fathoms, so that the producing cause appears to have acted upon particular points. In mining occupations, the contact of a fault, or dyke, is carefully avoided, as the penetration of this natural barrier would often admit the rush of waters from the other side, and cause the inundation of the mine. At Gosforth colliery, two or three miles from Newcastle, while standing nearly over the Ninety Fathom Dyke, the manager informed me, that, about the year 1825, a winning was attempted on what turned out to be the wet side of this great dyke, but was speedily abandoned in consequence of the inundations. They then crossed the dyke, and sank the present shaft but a few yards from the former one, and were compelled to descend nearly 200 fathoms to reach the coal; which they succeeded in doing, without any impediment from water.

To sink to the seams of coal is called "winning" a colliery; and after having bored and satisfactorily ascertained the presence and depth of coal, the first object of the adventurers is so to dispose the shafts as to make the natural inclination of the strata subservient to their purposes—namely, so that mining operations may be carried on towards a higher level, and facility be thus afforded for the descent of water, and the ready transit of the coal in the working of the mine. It is always desirable, for the perfection of ventilation, to sink two shafts, one for the entrance, and another for the exit, of the air—the former called a "downcast," and the latter an "upcast," shaft. But although extremely desirable, it is not always practicable, to open two shafts; for where the coal lies deep, or difficulties are rife, the sinking of one shaft is an affair of such magnitude, in point of expense, that few persons enter into it alone: hence, a colliery is commonly the property of a company, or of several partners or shareholders. The capital required for the establishment of a first-rate sea-sale colliery, including winning, machinery, houses, waggons, &c., is very large, varying from L.40,000 to L.150,000. The expense of sinking a single shaft, including outfits and machinery, varies from L.10,000 to L,40,000. The expense of opening a colliery upon a scale to work 100,000 Newcastle chaldrons annually, from two seams of coal, one lying at forty and the other at seventy fathoms below the surface, inclusive of the machinery, colliery-houses, &c., has been estimated at L.50,000. When, however, mining difficulties occur, the expenses are fearfully increased. The arch-enemy of coal-winning is *water*, and there are some mines from which a much larger quantity of water is raised than of coal. One chief use of the large assemblages of steam-power in several of the northern collieries is for pumping water. The occupation assigned, according to ancient mythology, to the fifty truculent daughters of Danaüs, was scarcely more interminable than that of many pumping engines at collieries. In the sinkings at the Great Hetton colliery, there were three principal feeders met with; the first issuing 2000 gallons of water per minute, the second 1000 gallons, and the third 1600 gallons per minute. It is generally supposed that this water is originally derived from the surface, inasmuch as at great depths the "feeders" are much less abundant and much less formidable, and the main body of water issues at not more than forty or fifty fathoms from the surface. It is not, however, by percolation that much of the water penetrates to the mine; for although the "posts," or sandstones, are porous, and admit the passage of water, yet the shales are compact and impervious to it. The numerous cavities and fissures in the strata become extensive reservoirs for the accumulation either of water or inflammable gases, and these are often let out unwittingly by a single blow of a pick.

The water of the coal-pits is frequently much purer than might be imagined, although it usually holds some foreign ingredients in solution, such as sulphate of iron. It is a very remarkable fact that some of these waters are salt, and, what is still more remarkable, salter than sea-water. This is sensibly demonstrated, not only by the taste, but by the smarting occasioned upon the falling of any of this water upon any part of the body where the skin is rubbed. At one pit, a feeder was pumped not long since which was estimated to be three times salter than the sea. The abundant supply, indeed, of these "brine springs" at three contiguous places, suggested the erection of salt works.

It has happened in sinking a shaft, where all had proceeded favourably for many fathoms, that, on coming to the next fathom, the privacy of some too fertile feeder has been intruded upon; and, to complete the successful passage through that one enemy's domains, a pumping engine has been necessary, which, upon advancing to the next fathom, could be dispensed with. It is generally found essential to line the shafts; and formerly wooden casing, or "tubbing," as it is called, was employed, but of late years a great and necessary improvement has been introduced by the adoption of cast-iron tubbing.

The concentration of steam-power for pumping is enormous at some of the pits; as at those of the new winning of the South Hetton Company at Datton, which is affirmed to be nearly the largest now existing in so small a space. During the progress of the attempted winning of a pit at Haswell, through the sand beneath the magnesian limestone, the engine-power erected pumped feeders to the amount of 26,700 tons per diem. At Friar's Goose colliery, near Gateshead, the feeders require three columns of pumps, each 16¼ inches in diameter, raising upwards of 1000 gallons per minute, or above 6000 tons per day, whilst the weight of coals drawn varies from 250 to 300 tons per day. Thus it will be seen, that it is not merely during the sinking of the pits, but also very frequently during their future existence as working mines, that pumping power must be employed. Upon the pulsations and vibrations of those ever-beating engines depend the freedom of the mine and the security of the miners. Engines of 200 horse-power are not unusual for this purpose. At the Percy Main pits, which produce that valuable coal known in the market by the name of Bewicke and Crastor's, of the 586 horse-power in operation for various purposes, 440 are working for pumping, one of these engines rating at 250 horse-power. At the Eppleton Jane pit, of the Hetton Company likewise, the pumping engine is of 250 horse-power. At the new winnings at Seaton Delaval, too, are two or three very powerful engines, of beautiful workmanship, which, as far as water is concerned, are perhaps not likely to be "out of work" for some time to come.

* The writer of these articles has to acknowledge himself considerably indebted to the Report on the Newcastle Coal-Mines, &c., by J. R. Leifchild, Esq., lately presented to both Houses of Parliament.

In addition to steam-engines for pumping water, there are those for "winding" or raising the coals, which also serve for lowering or raising the men and boys; occasionally small steam-engines are erected under ground for the working of inclined planes, and above ground, for saw-mills and other similar purposes. At the collieries of the Great Hetton Coal Company there are eight shafts and eight winding engines, four of which are each of 100 horse-power. In the Hetton pit there is a subterranean steam-engine in use of 60 horse-power, calculated to draw a load of 7 tons 4 cwt. up a bank of 570 yards in length. At the Eppleton pit, which I descended, I was informed that they drew or raised, upon an average, 50 score of tubs of coals per diem, or 333 tons 18 cwt., the winding engine being of 100 horse-power. At the Ellemore pits, again, they raise 80 score of tubs, each weighing 8 cwt. 1 qr. 14 lbs. per diem from each of the two pits. At another pit it is reckoned that they raise in twenty-four hours 5040 corves up 100 fathoms. The technical mode of estimating the power or duty of these engines, is to calculate the number of pounds lifted one foot high by the expenditure of one ton of coal in the fire-box of the engine; and at Hetton, this number of pounds was found to be 40,642,560 lbs.

The steam-engines for coal-pits are generally manufactured at some of the large engine foundries in Newcastle and its neighbourhood. In a few instances, at the largest collieries, they are made on the premises of the company. In these cases there is a large establishment of smiths, wrights, and carpenters kept up; and a large piece of ground, denominated a "raff-yard," is appropriated to the different species of work in operation. The raff-yards at Hetton and Seaton Delaval collieries are fitted up with every convenience for the manufacture and repair of all that is needed for these extensive concerns, and of themselves resemble engineering establishments. Such is the amount of wear and tear constantly occurring at the large pits, when in full work, that these raff-yards are generally scenes of active business.

GOSSIP RESPECTING SELF-EDUCATED POETS.

The French have latterly come to have their self-educated poets of humble life as well as ourselves. The fame is great of both Reboul, of Nimes, who is a *baker*, and of Jasmin, of Agen, who is a *hair-dresser*. It is remarkable of both of these men, and very much to their credit—perhaps also saying something for the good sense of the people amongst whom they dwell—that they continue contentedly to pursue their respective vocations, each in his original situation, as if it were never presumed that their literary powers formed any reason for their being drawn into a sphere of life for which, perhaps, they would be unfitted. Somewhat different are the ideas entertained of humble men of genius in this country, where no sooner does any thing unusual in letters appear than the question is asked, "What will be made by it?" Here, the literary talent takes its place amongst the ordinary money-making energies: there, it seems more reserved as a grace to an ordinary and useful course of existence.

Jean Reboul is the son of a poor man, and was reared in poverty by a widowed mother. He enjoyed no regular education. The death of a wife, to whom he had been only married a few months, first awakened poetry in his breast. His verses were all of a tender and elevated cast, strikingly different from the style of his ordinary conversation. He first drew public attention in 1828 by the publication, in the *Quotidienne* (now the well-known Carlist newspaper), of a short piece entitled "The Angel and the Child," of which our esteemed contemporary, *The Athenæum*, lately gave a translation so just and beautiful, that we gladly spare ourselves the trouble of attempting a version ourselves:—

An angel form, with brow of light,
Watch'd o'er a sleeping infant's dream,
And gazed as though his visage bright
He there beheld as in a stream.

"Fair child, whose face is like to mine,
Oh, come," he said, "and fly with me;
Come forth to happiness divine,
For earth is all unworthy thee.

Here perfect bliss thou canst not know;
The soul amidst its pleasures sighs;
All sounds of joy are full of woe;
Enjoyments are but miseries.

Fear stalks amidst the gorgeous shows;
And, though serene the day may rise,
It lasts not brilliant to its close,
And tempests sleep in calmest skies.

Alas! shall sorrow, doubts, and fears,
Deform a brow so pure as this?
And shall the bitterness of tears
Dim those blue eyes that speak of bliss?

No, no!—along the realms of space,
Far from all care let us begone;
Kind Providence shall give thee grace
For those few years thou might'st live on.

No mourning weeds, no sound of wail,
Thy chainless spirit shall annoy;
Thy kindred shall thy absence hail
Even as thy coming gave them joy.

No cloud on any brow shall rest,
Nought speak of tombs or sadness there;
Of beings like thee, pure and blest,
The latest hour shall be *most* fair."

The angel shook his snowy wings,
And through the fields of ether sped,
Where heaven's eternal music rings—
Mother, alas! thy son is dead!

Lamartine was so much moved by the beauty of this poem as to seek out and celebrate the author. Other literary men of note paid him flattering attentions, and the press poured forth speculations on the incongruity between the condition of the man and the strain of his verses. Some of the most eminent poets of France, including Chateaubriand, have since visited Reboul at his humble abode in Nimes, and Reboul has himself appeared as a lion in the Parisian salons. Still, he is quite unspoilt, and yet bakes as he has ever baked. The dramatist, Alexander Dumas, has described, in a very interesting way, an interview he had with the poet-baker at Nimes, in 1836:—

"My first thought on arriving at Nimes was—Reboul. A young man conducted me to his shop, at the corner of a narrow street. I knew that I was to meet one whom I may call a distinguished poet; but I did not know whether I should find him simple and natural, or the reverse. I went in. 'Is it M. Reboul whom I have the honour of addressing?' 'Himself.' 'A letter from M. Taylor.' 'Oh! how is he?' 'Perfectly well;' and he began to read. In the meantime, I examined him. He is a man from thirty to thirty-seven years of age [in reality, he was then forty], rather above the middle height, with a dark African complexion, black shining hair, and beautiful white teeth. When he read my name, he looked at me once more, and bowed a second time. This look was rapid and profound; and I only then perceived that he had a splendid pair of eyes, with that oriental expression at once powerful and soft, made to express love and anger. 'Sir,' said he, 'I have indeed many obligations to M. Taylor, and I don't know how I shall ever acquit myself of them.' I bowed in my turn. 'But will you permit me,' continued he, 'to act towards you with perfect frankness?' 'I beg you will.' 'Well, you are coming to see the poet, and not the baker, are you not? Know, then, that from five in the morning to four in the afternoon, I am baker; from four in the afternoon till midnight, I am poet. If you want small loaves, remain; if you want poetry, come back at five.' While I promised to come back at the appointed hour, some customers came in; and as he served them, he remarked to me, 'You see we could not have a moment.' A man then appeared and said, 'Master, the oven is ready.' And the author of '*L'Ange et l' Enfant*' went away to work at his dough and his oven.

When I returned at five, Reboul met me at a door in a lane, adjacent to his shop, which was still open, but confided to the care of others. He had changed his working-clothes for a suit of great neatness but rigid simplicity. Mounting a stair, and passing through amongst some sacks of wheat, we came to the door of a room, where nothing, he said, but prayer and poetry ever entered. It was a neat small apartment, furnished with a bed, a writing table, a few wicker chairs, a crucifix, and a library consisting of the Bible and Corneille. 'I now see,' said I, 'that yours is a double life.' He explained that it was well to make the limbs work while the brain rested, and the limbs again rest while the brain worked. 'But what made you a poet?' 'In one word, *misfortune*.' From my look round his neat and cheerful apartment, he saw that I was puzzled. '*Have you never*,' said he, '*passed over a grave without knowing it?*' A tear came into his eye, and I held out my hand to him. 'When a great sorrow befell me,' he said, 'the commonplace though well-meaning people around me endeavoured to give me consolation. This only turned the stream of grief back into my heart. I could find no vent for it but in addressing God; and when I did this, I found that I was creating poetry. Afterwards came the desolation of the throne and the fall of political and religious principles, in which I found new matter for lamentation and for verse. So I may say that my own and the public misfortunes together have been my inspiration.'" It will from this be readily inferred, that Reboul is a friend of the exiled royal family. M. Dumas goes on to state that he caused Reboul to read his poems, which were then unpublished, and that he thus spent the whole evening in a most delightful manner.

The compositions of the baker-poet have since been presented in a small volume, which has already gone through five editions. It is remarkable of them that they show no trace of the personal circumstances of the author. The whole are conceived in a strain of exalted and beautiful sentiment, which would give delight from whomsoever it might be supposed to proceed. Neither is there any false taste to be excused on account of the poet's occupations and deficient education. The only thing that strikes us unfavourably on a perusal of the volume, is the resemblance of one or two of the pieces to well-known productions of the British muse—a fact not very easily accounted for, if it be true, as given out, that Reboul does not read English. We must content ourselves with attempting a version of one further specimen:—

THE CASTLE OF THE MENDICANT.

A dun and barren mount there is, upon whose sloping base
Lie heaps of ruins over which thorns only meet the gaze,
Where venomous adders ever creep, and vultures hunt for prey.
A shepherd told me of the place a story yesterday,
With so much earnestness that he compell'd me to believe;
And now, my friend, shall you from me the narrative receive.

Within that castle lived of yore an avaricious lord,
Who to the beggar's pressing wants would no relief afford,
Refusing ev'n the petty boon of one poor crust of bread;
And holy friars to those gates accursed never sped,
To beg, for blessed charity, the smallest coin or mite,
Wherewith to aid the poor on whom had sunk misfortune's blight.

When the long watch of those within, upon tempestuous nights,
Brighten'd the cloister'd windows with the blaze of many lights,
If some poor wanderer from afar, attracted by the glare,
Hoped fondly from his panting toil to rest and cheer him there,
No sound came e'er in answer to his supplicating cry,
Save from the court-yard, where fierce ban-dogs howl'd incessantly.

One eve, a being wild and strange came thither, it is said,
A down whose drooping back a mass of trailing locks was spread,
Like torrent in the winter time from high Mont Blanc outpour'd;
His forehead, ample, bald, and with full many a wrinkle scored,
Appeared to bear on it the marks of age on age impress'd,
Like those huge monuments that on the sands of Egypt rest.

"O, Castellane! be merciful," the hoary wanderer said;
"Open, for I am aged, and the night is one of dread.
Beneath the weight of ice and snow the forest groans afar,
And fiercely doth the north-wind breathe from out his rapid car;
The lake lies sunken gloomily in silence sad and deep,
And o'er my feeble body chill and mortal shiverings creep."

A voice of thunder gave reply—"At such an hour as this,
Who rashly dares to trouble thus my mansion's peacefulness?
If from these castle-bounds afar thou be not quickly gone,
One of my serfs, with hammer arm'd, shall be with thee anon,
And I shall make him nail, because thou prowlest here so late,
Thy rascal carcass to the wall beside my castle-gate."

"Forgive me, if my prayer be rude," then answer'd the unknown;
"But long ere I could reach the skirts of yonder nearest town,
I should sustain a living death deep in the drifting snow,
And my beloved family no more my face should know.
Oh, grant me but a corner in your sheds till break of day—
Or in your kennel!" "No! thou wouldst defile the place; away!"

Then all at once the mendicant erectly raised his head,
From which a beam of wrath divine was by reflection shed:
"Thou deemest me a beggar—Ho! I am a Mighty Lord!
And spite of these refusals, I will seat me at thy board."
"A mighty lord! whence comes so vain a fantasy as this?
What thy estate?" "The Earth!" "Thy name?" "My name Misfortune is!"

And as the screech-owl stretches out its dark and ominous wings,
That it may scatter far and wide the news of fatal things,
So with his hands the stranger spread abroad his ragged cloak,
And smote with iron foot the earth, which open'd with the stroke,
And yawningly a fearful cloud of mist gave forth to view,
Amid the gloomy whirls of which away the spirit flew.

Not long thereafter did the lord of that cold lonely tower
Behold one child dishonour'd fall within a villain's power
Again, he saw his only son in single combat fall;
And, passing by, the Jacquerie at length made end of all,
By butchering each living thing within that castle found,
And razing all its lofty walls and turrets to the ground.

And ever since, before these dark memorials of the past,
Pale grows each cruel lord whene'er his eye is thither cast;
Nor can the lapse of time efface the horrors of the scene;
The shrinking kid declines to browse where these old walls have been;
And oft belated shepherds see shades bleeding, grim, and gaunt,
And still they name the place the Castle of the Mendicant.

Jasmin, the hair-dresser of Agen, resembles Reboul in history, circumstances, and personal character. A friend of ours paid him a visit two years ago in the course of a tour of the south of France, and found him living contentedly, like Reboul, in his little shop, although almost daily visited by distinguished persons, who are attracted by the fame of his works. He is a simple and unpretending man of genius, respecting himself too much, we presume, to be affected for the worse by the flatteries of those who are his superiors in worldly rank. Our friend purchased several volumes of his poetry, and submitted them to us; but they are composed in a patois so different from classic French, that we were baffled in an attempt to read them. We have been furnished, however, with a version of one piece, which may serve as a specimen:—

FIDELITY.

Now nature all lies free from care,
And all is calm beneath the heaven;
The hawk is calling through the air,
The owl succeeds the bird of even.
Alas! I drain the cup of woe,
I smile no more beneath the sky,
My friend is lost to me below—
Now I must droop and die!

Oh! moon of love, droop down the sky,
Thou givest me too great a sorrow;
No gleams of peace from thy fair eye,
No calmness from thy look, I borrow.
Thy gentle smile, so pale and dim,
Recalls to me my misery;
Oh! moon of love, far, far from him,
My friend, I die, I die!

The nightingale, the flowers, the air,
Announce no more that spring advances;

The daisy shining soft and fair
No more my heart of hearts entrances;
No more around me Earth has thrown
Her chain—Death is my remedy;
My friend has left me all alone—
I pine, I faint, I die!

Our readers will remember an article which appeared in the Journal last autumn, entitled, "A Chapter in the Life of a Poor Man," being, in fact, a passage in the actual history of William Thom, an Aberdeenshire weaver, who had attracted some notice by a few poetical effusions of merit. Any who felt interested in the unfictitious sorrows of this worthy individual, will be glad to learn that he is once more settled in comparative comfort at Inverury, in his original profession as a country weaver. From a batch of his late compositions which he has sent to us, we select the following as containing, we think, some fine strokes of natural feeling.

THE MITHERLESS BAIRN.

When a' ither bairnies are hush'd to their hame,
By aunty, or cousin, or frecky grand dame,
Wha' stan's last an' lonely, an' naebody carin'?
'Tis the puir doited loonie—the mitherless bairn!

The mitherless bairn gangs till his lane bed,
Nane covers his cauld back, or haps his bare head,
His wee hackit heelies are hard as the airn,
An' litheless* the lair o' the mitherless bairn!

Aneath his cauld brow sican dreams tremble there
O' hands that wont kindly to kaime his dark hair!
But mornin' brings clutches, a' reckless an' stern,
That lo'e na' the locks o' the mitherless bairn!

Her spirit that pass'd in yon hour of his birth,
Still watches his lone lorn wand'rings on earth,
Recording in heaven the blessings they earn,
Wha couthilie† deal wi' the mitherless bairn!

Oh! speak him na' harshly—he trembles the while,
He bends to your bidding, and blesses your smile!
In their dark hour o' anguish, the heartless shall learn
That God strikes the blow for the mitherless bairn!

Under this head, it may not be amiss to advert to a notice which has appeared with respect to a surviving sister of Burns. It appears in the form of an extract of a letter from Mr R. Chambers to Mr Thomas Carlyle—as follows:—

"A sister of Burns, the last survivor of his father's family, still lives. She is now a widow at an advanced age, and resides at the village of Tranent, in Haddingtonshire, with two unmarried daughters, who endeavour to support her by the exercise of their needles. I lately paid her a visit, and found her a decent-looking old person, with a good deal of the poet's physiognomy, and particularly his fine dark eyes. The youngest of William Burns's children, she was twelve years old at the time when he died at Lochlea, a broken-spirited man. She was one of the household at Mossgiel during its occupancy by Robert and Gilbert Burns in succession, and she afterwards married a person named Begg, who, for ten years, conducted the business of Gilbert's farm of Dunning, on the estate of Sir Charles S. Monteith of Closeburn. Since the death of her husband, her sons being all removed from her, and unable to assist her, she has been dependent on her two daughters, who, though active and most respectable young women, are barely able to keep house for themselves and their venerable parent. In short, the Sister of Burns has fallen in the course of Providence into poverty, and her last years are threatened with those distresses, the dread of which is the theme of so many of her brother's verses. I was much affected on hearing her say that, having in her earliest years been witness of the troubles which lowered over her father's house, having afterwards partaken of the hardships at Mossgiel, having passed through a long married life in circumstances at no time easy, and being now reduced to absolute indigence, she felt as if she had walked side by side with Grief from her very childhood. One only alleviation of her fate has sprung from the fame of her brother, in the shape of the most trifling annual pittance from the Scottish Exchequer. She was lately a candidate for the benefit of a fund called the Craig-Crook Mortification [*Anglice*, endowment]; but her application, for the mean time, failed. I am satisfied, from rigid inquiries, that Mrs Begg and her two daughters are perfectly worthy persons, and that complaint would never have been heard from them, if the most self-devoting industry on the part of the young women were sufficient to keep their mother in comfort. The public is doubtless much taxed; but, on the other hand, some claims are sacred. The poems of Burns daily give delight to thousands, and will continue to do so for ages. His productions wax yearly in public esteem, as time passes on and brings no second Burns. The name of the Ayrshire bard has even been associated by some living writers with those of which England is proudest. While HE soars so high, to think of one so near and dear to him as a sister sinking into penury—hearing from a cold ingle-cheek the echoes of a nation's acclaim at every mention of the name she bears—she, the last of the real members of that group which, as a poetical picture, must live for ever in the 'Cotter's Saturday Night'—in short, the SISTER OF BURNS—to think of all this, I say, is more than I can suppose the public patiently enduring, burdened as it is."

Our readers will be glad to learn, that in consequence of this notice, Sir Charles S. Monteath, Mr Carlyle, and Mr John Wilson, 41 Regent Square, London, have undertaken to act as a committee to superintend the collection and disposal of a fund for the benefit of Mrs Begg, and that already some handsome tributes have been paid in, affording ground of hope that a sufficiency will be obtained to procure her a small annuity.

* Comfortless. † Kindly.

A FEW WEEKS ON THE CONTINENT.

NEUCHATEL.

FROM Friburg to Berne was a pleasant afternoon's ride; and procuring the proper signature to our passport, we set off in the morning for the most accessible part of the French frontiers, by way of Neuchatel. This is a route little pursued by tourists; and, indeed, such is the discomfort which one is apt to encounter in travelling through France, that not one in a thousand among English tourists in Switzerland returns home by any other path than that by which he reached it—the Rhine, a water-way ever open, commodious, and agreeable.

Having proceeded formerly from Berne to Morat, and thence to Neuchatel, we now, for the sake of variety, adopted the somewhat circuitous route by Aarberg and Bienne, which, however, affords little scope for description. In this north-western quarter of Switzerland the scenery is on the whole dreary and tame; but everywhere we see the same orderly industry and neatness of arrangement which have distinguished more highly favoured districts. As we approach the Jura, much of the land is observed to be little better than an extensive morass, spreading between the lakes of Neuchatel and Bienne, which, in former times, had evidently been in much closer union. On the eastern shore of the Lake of Bienne, a sheet of water ten or twelve miles in length, the land is well enclosed and sectioned into the usual small agricultural possessions, while, on the western bank, the Jura rises from the edge of the water in one long line of vine gardens, rising one above another to a height of several hundred feet. Lately, a road has been cut along the base of the mountain; and by this, after paying a short visit to the town of Bienne, we proceeded onward to Neuchatel. No steamer is employed on the lake; but a number of boats, impelled by oars or sails, seem to be employed both for fishing and general intercourse. The principal feature of interest and beauty of the lake—at least that which has attracted the chief attention of tourists—is the Isle of St Pierre, or, as it is often named, Rousseau's Island, from having for a short time (1765) been a place of retreat for that remarkable enthusiast, who clung to it with passionate fondness. In the present day it is prettily wooded, with some open and cultured fields, and may be readily reached from a small port on the western shore of the lake, at which there appears to be a respectable inn for the accommodation of visitants.

The town and Lake of Bienne, with the neighbouring country, are within the canton of Berne, and consequently form part of German Switzerland; but on reaching the southern extremity of the lake, we pass into the canton, or, properly speaking, the principality of Neuchatel, whose population uses the French tongue. A few miles farther on we arrive at the town of Neuchatel, which occupies a pleasant situation on a flattish piece of ground at the foot of the Jura, and close upon the lake to which it has imparted its name. Basking in the full blaze of the summer sun, with such a lake in front, and backed by the lofty range of the Jura, extending a length of at least forty miles in one uninterrupted series of vineyards, Neuchatel enjoys one of the finest situations in Switzerland, and is the capital of one of its most thriving districts—albeit that that district is, to a certain extent, under the thraldom of a monarchy. On entering the town, which numbers about 6000 inhabitants, we perceive a striking difference of appearance from other Swiss cities. Many of the houses are large and princely in aspect, and the French style of architecture prevails throughout. Near the lake there are some handsome new streets, the structures being of fine whitish sandstone; and here is situated the college, an educational institution of no mean reputation, and to which M. Agassis, the zealous geological inquirer, is attached as a professor. The Hotel de Ville, the seat of the civic and cantonal government, is a large and handsome edifice in the Grecian style, at a short distance from this newer portion of the town. The structures in this quarter, however, are less interesting than those in the higher part of the city. On a prominent knoll, which commands an extensive view of the lake and the town beneath, is perched the ancient castle, the acropolis to which the population, in days of feudal strife, crowded for protection. It consists of a few old edifices of great strength, including a chapel, and the whole is surrounded with a wall. One of the houses is the residence of the governor of the province. We saw only one or two soldiers, and the general air of the place was that of desertion, impressing the visiter with the happy idea that the art military was in small request in the district.

The meaner parts of the town of Neuchatel, behind the main thoroughfares, approached nearer in point of squalor and dinginess to what one is accustomed to in some of the large cities in Great Britain than any thing we had seen in Switzerland; but we observed no tokens of destitution, and I understand that the number of paupers is decreasing with the increasing trade of the city and canton, and as time effaces the social injuries produced by French domination. In the town there are some large beneficiary institutions, handsomely endowed, which provide relief, on a judicious scale, for those whom misfortune has reduced to poverty. Both from the town and neighbourhood there are considerable exports of wine of a good quality, printed cottons, and lace, all which, independently of the export of watches, yield considerable profit, and help largely to support the population.

The political position of the canton of Neuchatel is somewhat peculiar. Although a member of the Swiss republican confederacy, it is at the same time a province under the sovereign rule and protection of the king of Prussia. Formerly, it was a kind of feudal fief or principality belonging to the old French family of Longueville, which, becoming extinct in 1707, the king of Prussia, as nearest heir, was acknowledged as its superior, and his title was confirmed by the peace of Utrecht. Except for an interval, during which it was absorbed and half ruined by France under Napoleon, it has continued till the present day a principality of the king of Prussia, who does not appear to have been a hard master. In 1814, the reigning monarch gave it a constitutional charter, reserving his own sovereignty and the privilege of appointing the governor, the mayor, and 45 out of the 75 members composing the grand administrative council. Under the title of civil list, he also draws £3862 per annum, or nearly a fourth part of the revenue of the state; but, as some equivalent, the trade of the canton with Prussia is placed upon a liberal footing. In all other respects than those mentioned the canton of Neuchatel is politically independent; and since 1814, it has been a member of the Swiss confederacy.*

With a population of about 60,000 souls, this mountain principality may be said to form a little world in itself—a perfect model of ingenious industry, prosperity, and good management. The greater part of the people are farmers of their own small possessions, tradesmen, and mechanics; and here, as elsewhere in Switzerland, the grand object, ever alluring industry onward, is the realising sufficient wealth to purchase a small piece of ground and cottage. This universal taste scatters the population in all directions among the recesses of the Jura, and consequently prevents that pernicious clustering together in towns which undermines public health and morals. With an unsophisticated state of society, in which all are equally concerned in preserving individual and general independence, the system of public finance and administration is on a footing so primitive as almost to appear Utopian. The state revenue, drawn principally from rents of domains, small quit-rents, tithes, forests, post-office, and turnpikes, amounted, in 1834, to L.16,679. This mighty sum was distributed as follows:—Entire expenses of administration, L.1966; pensions, L.224; justice, L.2394; war department, L.202; religion, L.836; education, L.445; public works, roads, police, expenses of confederation, &c., L.2400; and civil list of the king of Prussia, as already stated, L.3862; leaving a surplus in the exchequer of L.3500. Some things here are very deserving of remark. The people are governed without any thing like personal taxation; and supposing them to directly contribute what forms the state revenue, the exaction would amount to no more than 4s. 8d. for each individual yearly, or about a tenth of the rate per head in Great Britain. Justice is administered on a scale of rational economy which would astonish the frequenters of Westminister Hall. A judge of the higher class is paid at the rate of 1s. 10d. for a four hours' sitting; a summons is 7d.; and the expense of a litigation is something under 6s. So far is the cheap and quick administration of justice from promoting litigiousness, that the judges are often seen sitting unoccupied for a whole day. There are no stamps or patents.† Protestant and Roman Catholic clergy are alike paid by the state, the highest salary of a clergyman being L.121; but they also depend on voluntary contributions, and some have small glebes. Religious instruction is well attended to, and the state of public morals is considered to be good. With respect to secular education, it is obligatory on parents to send their children to school, and no person of middle age is found who cannot both read and write.

Let us now take a view of the country, and the nature of the people's employment and mode of living. Having sufficiently satisfied our curiosity in the town, we set off on our journey towards the French frontier, by a route which conducted us in a southerly slanting direction, up the face of the Jura, and through a

* I believe that the majority of the inhabitants are not favourable to the Prussian connexion, their political principles having a strong leaning to republicanism; and there is little doubt that, but for the military power of Prussia, ready to be called in if necessary, the canton would speedily dismonarchise itself. An effort at rebellion in 1830-31, was quelled by General Pfuel, with the assistance of the more aristocratic portion of the community. With whatever hereditary claims on the territory, it does seem hard that the fourth part of all the taxes raised should be handed over to a foreign prince.

† I gather the greater part of these particulars from the Report of Dr Bowring to Parliament. He observes, with respect to the administration of justice—"While, on the one hand, the cost to suitors is small, the cost to the public is no less so. In the district of Valangin, consisting of 6104 souls, the expenses for the administration of civil justice for 1834 amounted to 1121 francs of Neuchatel, or less than five-sixths of a farthing per individual; yet there are 122 trusteeships of minors, lunatics, &c., committed to the charge of civil tribunals. There are, on an average, 70 cases per annum, the average cost of which to the suitors was 47 batzen, being little more than 4s. 6d. per suit.'

gorge among the mountains named the Val Travers. It was a fine autumnal morning as our vehicle slowly ascended this romantic path; and at every bend round the vine-clad knolls, we had an opportunity of catching glimpses of the Lake of Neuchatel and a great extent of country beyond, the horizon being bounded by the rugged line of the Bernese alps burying their white tops in a huge canopy of clouds. At length, the sight of this glorious scene was shut out; we had taken the last look of Switzerland, and our attention was called to the picturesque valley into which we had now advanced.

The Val Travers, as it opened upon us, came with unexpected beauty and grandeur; so much so, that it was agreed to be one of the finest sights we had seen in our excursion. Let the reader conceive a green and romantic valley, winding miles in length, and of great depth, between the bounding mountain steeps; while on its northern side, and at least five hundred feet from the bottom, a road, which we are now traversing, is cut out of the side of the hill. On the one hand are lofty crags, occasionally overhanging the pathway, as if about to fall; and on the other is a profound valley, down to the bottom of which we look with dizzy and wondering eyes. The lower parts of the vale are green, and beautifully dotted with trees, bushes, and here and there a cottage or hamlet with its mill, turned by a brook, which is seen sparkling in the sun's rays. Goats are feeding in patches on the hill sides, tended by children from the hamlet; and in a slip of meadow, by the side of the stream, the scene is enlivened by a cow or a few sheep. The day is fine, and all is impressed with the tranquillity of Nature in her mildest mood.

We are now in the heart of the mountains, but still rising in our course. The scene is gradually shifting as it were in a panorama. The country is becoming more bleak and pastoral. Still there is no lack of inhabitants. Detached cottages are seen at lesser or greater distances on the hill sides, and we pass through a small town with its inn, church, and other tokens of local consequence. At this town we stopped to dine and rest the horses, afterwards proceeding with all the leisure which the nature of the ascent demanded. Passing the village of Motiers Travers on our left, in the bottom of the vale, we make a curve to the right, into what may be called an upper valley with still more precipitous sides, and in which the road at one part goes through a tunnel in the enormous overhanging rock. Deep in the bottom of the defile, quietly reposes the ancient village of St Sulpice; and a little way above it is a very picturesque mill-house, whose wheel is observed to be turned by a stream issuing at a few yards' distance from the side of the mountain.

On emerging from the summit of the pass above St Sulpice, the highest point of the road is attained, and we are now in an open tract of country brown and dismal, but still, as before, in the possession of a people who live, thrive, and are apparently happy, at the height of three thousand feet above the level of the sea, and in the midst of what seems little better than a wilderness. Throughout our whole day's journey to this point, we saw on all sides evidences of that untiring industry which is the most remarkable feature in the character of the Swiss. At nearly every window in the humble cots by the wayside, or in the villages, are observed men working at their trade of watchmaking, or women busily engaged in the making of lace. In fact, we are now in the chief watchmaking district of Neuchatel, which extends from Verviers to Locle and La Chaux de Fonds—all places near the frontier of France, and therefore very well suited, in point of situation, for supplying materials for an active contraband traffic.

The existence of a great manufacture in cottages scattered over fifty miles of mountains, covered four or five months of the year with snows so deep as to imprison the inhabitants in their dwellings, is, I consider, a singular fact in social economy, and well worthy of our notice. M. Houriet, of Locle, presented Dr Bowring with an interesting account of the birth and growth of the watchmaking trade, from which I draw the following passages:—

"As early as the seventeenth century, some workmen had constructed wooden clocks with weights, after the model of the parish clock, which was placed in the church of Locle in the year 1630. But no idea had as yet been conceived of making clocks with springs. It was only about the latter end of the same century that an inhabitant of these mountains, having returned from a long voyage, brought back with him a watch, an object which was till that time unknown in the country. Being obliged to have his watch repaired, he carried it to a mechanic named Richard, who had the reputation of being a skilful workman.

Richard succeeded in repairing the watch; and having attentively examined its mechanism, conceived the idea of constructing a similar article. By dint of labour and perseverance he at length succeeded, though not without having had great difficulties to surmount; and he was compelled to construct all the different movements of the watch, and even to manufacture some ill-finished tools in order to assist him in his labours. When this undertaking was completed, it created a great sensation in the country, and excited the emulation of several men of genius to imitate the example of their fellow citizen; and thus, very fortunately, watchmaking was gradually introduced among our mountains, the inhabitants of which had hitherto exercised no other trade or profession than those which were strictly necessary to their daily wants, their time being principally employed in cultivating an ungrateful and unproductive soil. Our mountaineers were frequently compelled, before the introduction of the above-named industry, to seek for work during the summer months among the people of the surrounding country. They rejoined their families in the winter, being enabled, from their economical savings, the moderateness of their wants, and the produce of a small portion of land, to supply themselves with the necessaries of life. And it must be remarked, also, that the entire liberty which they enjoyed, united to the absence of any description of taxation, greatly tended to relieve the hardships of their lot.

For a number of years, those who betook themselves to watchmaking were placed at a great disadvantage, by having to import their tools; but these they in time learned to make and greatly to improve upon. In proportion as men embraced the profession of watchmaking, the art became more developed; several returned from Paris, where they had gone to perfect themselves, and contributed by their knowledge to advance the general skill. It is not more than eighty or ninety years since a few merchants began to collect together small parcels of watches, in order to sell them in foreign markets. The success which attended these speculations induced and encouraged the population of these countries to devote themselves still more to the production of articles of ready sale; so much so, that very nearly the whole population has, with a very few exceptions, embraced the watchmaking trade. Meanwhile the population has increased threefold, independently of the great number of workmen who are established in almost all the towns of Europe, in the United States of America, and even in the East Indies and China. It is from this period, also, that dates the change which has taken place in the country of Neuchatel, where, notwithstanding the barrenness of the soil and the severity of the climate, beautiful and well-built villages are everywhere to be seen, connected by easy communications, together with a very considerable and industrious population, in the enjoyment, if not of great fortunes, at least of a happy and easy independence.

Thus, in defiance of the difficulties which it was necessary to overcome, in spite of the obstacles which were opposed to the introduction of the produce of our industry into other countries, and notwithstanding the prohibitions which enfeebled its development, it has at length attained a prodigious extension. It may be further remarked, that, from the upper valleys of Neuchatel, where it originated, it has spread from east to west into the valleys of the Jura, and into the cantons of Berne and Vaud; and, further, that all these populations form at present a single and united manufactory, whose centre and principal focus is in the mountains of Neuchatel.

If our watches have attained a certain reputation of superiority, it is in a great measure to be attributed to the independence of our workmen, and to the advantage which they have derived from a careful and studied execution of the several articles intrusted to their respective and particular talents. Indeed, on the one hand, each artisan working at home, and for whomsoever pays him the best price, and, on the other, the merchant having an interest to encourage by paying the best prices to those who furnish him with the best materials and work, a kind of emulation is naturally excited among the workmen to obtain a preference and an advantage. Perhaps, also, the spirit which is generally diffused among the inhabitants of mountainous countries, added to the habits and customs of our workmen, who are at the same time landed proprietors, have not a little contributed to the development of talent amongst our population. Living simply, and in the bosom of their families, occupied entirely (with the exception of a few agricultural cases) in the labours of their art, and not being exposed to those temptations which exist in corrupt large societies, it is very natural that they should be more assiduous and more desirous of attaining perfection in their art; and the more so still, as they derive a greater benefit from it; their reputation and their interest are equally engaged."

It is very pleasing to know that the watchmaking trade of Neuchatel continues to prosper, in spite of all the restrictions of surrounding states. In 1834, the number of watches manufactured annually in the canton was about 120,000, of which 35,000 were of gold, and the rest of silver. When to this we add the watches manufactured in the adjoining canton of Geneva, an idea may be obtained of the magnitude of this flourishing branch of trade. It is extremely probable that not fewer than 300,000 watches are exported annually from Geneva and Neuchatel. The greater proportion are necessarily smuggled out of the country, in consequence of the heavy duties or positive prohibitions of France, Austria, and other nations, through which they must go to find an outlet to America, England, Turkey, and countries still more remote. All attempts to stop this underhand traffic have signally failed. At one time, when the French authorities fell upon the plan of seizing every Genevese watch they found in the shops of Paris, the manufacturers at Geneva simply eluded their rapacity by smuggling a part of each watch to Paris to be stamped, then smuggling them back again, and finally smuggling them a second time into France completed and in a condition for sale. At present, Genevese watches will be insured to be delivered in Paris at an advance of 5 per cent., and in London at 10 per cent. As formerly noticed, it is calculated that 10,000 watches are thus smuggled yearly from Geneva into England. And why do they come by this indirect and discreditable channel? Because England has hitherto imposed a custom-house duty of 25 per cent., which, being 15 per cent. above the smuggler's premium of insurance, has been paid only to a very limited extent. The late proposition in Parliament to reduce the duty to 10 per cent., will in all likelihood open the trade to fair dealers, and serve the important ends of increasing the manufacture, benefiting the revenue, and serving the British public with an article which they require. The question here naturally arises, How far the increased introduction of Swiss watches will injure the home trade? As is well known, the Swiss watches are small, delicate, and not by any means durable, and they are purchased only from their great neatness and cheapness. They will, therefore, as long as they continue of that character, not supersede the manufacture and use of the higher class of English watches. Should the fabricants of Geneva and Neuchatel, however, commence the making of a substantial species of goods at a correspondingly cheap rate, there can be little doubt of their soon having the whole watchmaking trade to themselves. They are untaxed, live in a simple manner, possess a finer taste, and, from their temperateness of living, have a greater delicacy of hand than the generality of English workmen; all which advantages give them a pre-eminence in a craft depending much on personal qualifications.

All this time our caleche has been moving over a high moorish district, passing every few minutes the cottage of a watchmaker, whose nimble fingers are seen plying his vocation. Jean, our driver, suddenly draws up; we are in front of the French custom-house, and what takes place will furnish material for the beginning of our next article.

AN EAST INDIAN ANECDOTE.

It may be necessary to inform the reader that the drink called *toddy*, one of the strongest and most intoxicating liquors in India, consists of the sap of the cocoa-tree. The process of obtaining the liquor is simple. The toddy-collector leaves his dwelling after sunset; and seeking the thickest cocoa woods, climbs up, and cuts notches in the bark of such trees as seem likely to yield the most juice. Under each notch he affixes a small jar to receive the liquid, which, if drank instantly, is one of the mildest beverages possible, but if left during a few days to ferment in the sun, becomes the most ardent spirit known.

An incident connected with a person who followed the profession of a toddy-collector happened whilst I was in the country, the details of which are shortly as follows:—The individual in question had left his cottage, which was situated in a cinnamon grove in the island of Ceylon, little more than half an hour, when a native pedlar called there to exhibit his tempting wares, and to solicit a lodging for the night. The collector's wife, whose whole soul was wrapped up in the idea of finery, was delighted to let him in. Her *baugles* and *joiys*, which had hitherto been the pride of her life, were now eclipsed, and she sighed with envy as she saw all her former notions of grandeur fade before the contents of the wanderer's pack. Not daring, however, to purchase without her husband's approval, she was glad to allow the pedlar to rest himself on the bench beneath the door-porch—an ornament common to Ceylon cottages—in the hope of her husband's return by the morning.

After depositing his valuable knapsack beneath his head, the pedlar fell into a slumber, from which he was aroused by hearing a door creak—his sleep being, like that of most of his tribe, so light, that the slightest noise was calculated to disturb it. On opening his eyes, he beheld his hostess with her head protruding through the cottage door, attentively watching her guest. On seeing him stir, she made a short apology for thus awaking him, and retired. The itinerant vender took it into his head, however, that all was not right; so, after a short time, he again affected to sleep, indulging in one of those dozes when outward objects are visible, though indistinctly seen, by the weary watcher. In about an hour after, by the strong shadow afforded from an unclouded moon, the poor man saw some object approaching cautiously from the opposite direction. He supposed it to be the collector returning to his home; but, on looking up, to his dismay he perceived the woman stealthily drawing near with a long cocoa-knife in her hand. In an instant he was on his legs to confront her. She appeared somewhat startled, but declared that she had been in the woods seeking her husband, and that the knife she held was for the purpose of cutting down some jars left by him in the vicinity. The suspecting pedlar much doubted her story, but affecting to believe it, he saw her quietly re-enter the cottage and shut the door. No sooner was she within, however, than the traveller instantly climbed a tall tree, and took up his abode amidst the branches. Here he had been seated for some time, when he beheld the toddy-collector calmly returning home laden with his utensils, which he carried in a small sack over his shoulder. Worn out apparently with his exertions, and tempted by the beauty of the night, when he came to his door he paused for a short time; and sitting down on the bench lately occupied by the native merchant, he

seemed to fall into a train of deep thought. Presently, as if disinclined to enter the house, he made a sort of pillow of his well-filled bag, and covering his face, as is usual throughout the East, with his cummerbund, he fell fast asleep.

In less than another hour the door of the cottage was noiselessly opened, and the woman again appeared. She approached her husband, listened for a few moments to ascertain that he slept, and then stepping back a pace, raised her arm, and with her whole force, at one blow drove the knife right through her wretched partner's heart. For an instant only she seemed shocked at what she had done; then recovering herself, she attempted to withdraw the knife, which, having gone completely through her victim, had buried its sharp and fine point in the bench. After a severe exertion, she succeeded, but not without breaking off the point of the cocoa-splitter, which remained fixed in the wood. The woman's anxiety now to obtain the spoil, for which she had thus periled soul and body, appeared almost infernal. She seemed to grin in ecstacy at the deed she had done, and pant for the ill-gotten gain she had thus made her own. Exultingly she dragged what she conceived to be the pack of jewels from beneath the head of the corpse, when the movement drew from her victim's face the cloth that had covered it, and the savage murderess beheld the well-known lineaments of her own husband's countenance. She gave a sudden scream, and threw down the sack; then, with frantic cries, rushed from the cottage, and sought a shelter in the neighbouring woods.

The horror-stricken witness feared to move. If he descended, he might meet the murderess, who would doubtless revenge her dreadful mistake on the unarmed man, or, by possibility, he might become mixed up in the business; so he determined not to leave his place of refuge until morning. He therefore kept his position, staring, in spite of himself, at the dreadful object beneath him, in a sort of waking dream, till he was suddenly aroused by seeing the woman, accompanied by several persons (evidently officers of justice), approach the hut.

They examined the corpse; they searched the house, and began to take down their notes in writing, when the pedlar, anxious to seek their protection, by a sudden stir of the branches succeeded in attracting their attention.

In an instant a gun was pointed at him, and he was commanded to descend. The poor man willingly clambered down, when, to his horror and surprise, he was instantly seized and bound, at the instigation of the woman, who, with frantic gestures, declared that she recognised in him the assassin of her adored husband.

The wretched prisoner was immediately brought to trial, and, despite of his declarations of innocence, condemned to death, the woman's statement being clear and probable. She affirmed that the pedlar had come to their house and sought shelter for the night—a boon her husband had unhesitatingly accorded; that the two men had a severe dispute about the price of some trinkets, when her husband, in a fit of passion, thrust the itinerant merchant out of his house, who, it seemed, had not gone far, for soon after, the toddy-collector feeling warm and uncomfortable from the debate he had held and the liquor he had drunk, had gone to lie down. A slight noise, however, awoke his wife, who distinctly *saw* the wicked traveller stab her husband through the heart; that she then, without uttering any cry, from fear of instant annihilation herself, stole from the back-door, and rushed into the town for assistance, and had happily succeeded in arresting the assassin before he had time to escape.

This account seemed so plausible, that scarcely any one in the court doubted the prisoner's guilt. In the first place, what motive could the wretched widow, who was well known to have been warmly attached to her husband, have to invent a falsehood? In a word, a thousand arguments were brought forward to satisfy the jury of the guilt of the unhappy prisoner.

Only one person present doubted the whole story; and that, fortunately for the innocent man, was the enlightened judge before whom the case was tried. He felt assured of the truth of the defendant's statement, yet he had no means of upsetting the strong testimony of the woman. The jury returned a verdict of "guilty" without a moment's hesitation; but still the judge was not satisfied, and afterwards declared, that one of the most awful moments of his life was that when he found himself compelled to pass sentence of death on the unhappy prisoner. He, however, had one power, that of reprieve, and he exercised it, by delaying the execution of the culprit for fifteen days.

The very instant that he left the court, a sudden thought struck him. He directly sent for the bench on which the murder was said to have taken place, had it closely examined, and discovered that the point of a sharp instrument was lodged in it. This he had carefully extracted, and found it to be the end of a cocoa-nut knife, which of course further strengthened the judge's suspicions, and he sent a fresh reprieve to the prisoner. He then caused the road leading from the cottage of the deceased to the town to be closely searched and ransacked. His efforts happily succeeded. Close to the edge of a half-dried tank, the weapon was found: it was rusted with blood, had lost its point, and bore on its handle the name of the murdered man.

The woman, without receiving any previous notice, was seized, and the knife suddenly produced before her. The sight at once turned the current of her feelings: she fell upon her knees; confessed the whole; declaring that the temptation had been too great for her, but that God had determined she should not escape, since he had brought up the knife from the bottom of a tank into which she had thrown it; and all she now prayed for was instant death.

Two days afterwards she underwent her just sentence, while the poor pedlar was released from his ignominious confinement.

NOTES OF A RESIDENCE IN THE BUSH.

FOURTH ARTICLE. BY A LADY.

ANECDOTES OF THE COUNTRY—MODE OF LIVING—REMOVAL TO MELBOURNE.

We were visited one day by a very large party of natives; I am sure there were a hundred of them. I happened to be alone in the hut. Some of the men came into it and examined all they saw very attentively, especially the pictures we had hanging on the walls. They were much taken with a likeness of my mother, and laughed heartily at some black profiles; they said they were "black leubras." I told them to leave the hut, but they would not; and one, a very tall fellow, took the liberty of sitting down beside me on the sofa. I did not much like being alone with these gentry, so I rose to go to the door to call some one, but my tall friend took hold of my arm and made me sit down again; on which I cried out sufficiently loud to alarm my husband, who was building a hut behind. He came in and turned them all out, but they still kept hanging about the station for some time. My husband took his gun and shot some white parrots, which were flying in an immense flock overhead. Some of the natives ran and picked them up, and thrust them into some hot ashes, where they had lighted a fire, without even taking the feathers off. They were soon cooked in this way, and I believe ate very well. I had often seen black Tom cook parrots and cockatoos in this manner. The natives will eat any thing that comes in their way. I saw a woman take a piece of sheep-skin, singe the wool off, and then begin to eat it, giving her baby a piece of it also; much to my surprise, they actually ate a large piece of the skin. All these natives left us before sundown, and went to Mr Baillie's, where they were always allowed to remain as long as they chose. He was too kind to them, and gave them great encouragement in his own hut. We always expected to hear of some mischief there. At last one of them threw a spear at the groom, which stuck in his arm; it gave him great pain, and he went to the settlement to consult a doctor. In many instances, the undue severities of the settlers lead to reprisals from the natives, who are apt to inflict vengeance in a very indiscriminate manner.

At this time I had a pleasant visit from Mrs Gibson and her brother; they were on their way to a new station about fifteen miles beyond us. I was delighted to have the privilege of talking to a lady again; it was more than a year since I had seen one; and my little girl had not words to express her delight and astonishment. The sight of a "white leubra," as she called her, seemed for a time to take away her speech; but she soon began to question her very closely as to where she came from, and whether there were any more like her in her country. I am sure Agnes dreamed of her all night, for she often spoke of the beautiful lady in her sleep; and the moment she was dressed in the morning, she went to look again at her. Mrs Gibson was much amused at Agnes's admiration. I did all I could to persuade her to remain some time with us, and allow her brother to go on, and have some place comfortable for her to go to, but she would not. Some time after this, Mrs Gibson's courage was well tried. She had occasion to go a journey on horseback, and not knowing the road, she took a native with her as guide. When they were at some distance from home, the man wanted her to dismount, and, indeed, tried to pull her off her horse. He did not know she had a pistol with her; but she pulled one out and presented it at him, telling him that unless he walked on before the horse and showed her the proper way to go, she would shoot him. Had she appeared at all afraid, most likely he would have killed her; but her courage saved her, and she arrived safely at her journey's end.

When all the gentlemen were from home, one of the shepherds came to my hut door to tell me that in counting over his sheep, as they came out of the yard, he missed twenty-five. He was a stupid old man; so I asked the stock-keeper to get his horse and ride over the run; but he proposed driving the sheep over the same ground they had gone the previous day, in hope that the lost ones might join the flock. This was done; and when the sheep were again put into the yard, they were found all right. We had many alarms about losing sheep; but, except the time they were taken by the natives, we always found them. One night it had become dark, and there was no appearance of the sheep coming home. At last the shepherd arrived in a great fright, and said he had lost all the sheep—he could tell nothing about them. Every one, except Agnes and I, went out immediately to look for them in different directions. It came on a dreadful night of rain, thunder, and lightning, and was very dark; the men returned one by one, and no sheep were to be seen. I was sitting in no very comfortable state in the hut, and taking a look at the door every five minutes, although it was so dark that I could not see a yard before me. Little Agnes was in bed, as I thought fast asleep, but she called to me, and said, if I would allow her to stand at the window she would tell me when they were coming. I put her on a seat at the window, where she had not stood long, listening very attentively, till she told me they would soon be here, for she heard them far away. I thought she was talking nonsense, as I could hear nothing, neither could any of the men; but Agnes still said she heard them coming, and she was right, for in a few minutes my husband sent to tell me they were all safe in the yards. He and one of the men had found them in a hollow about a mile from home; but our next alarm was for James, who was still absent. My husband fired off several pistols, that he might know all were found if he was still looking for them; and we put a light in the window to guide him. He came in about twelve o'clock, but would scarcely own he had lost himself, although we knew very well he had; however, we all enjoyed our supper and a good blazing log fire, and were very thankful we had the sheep safe.

We often killed kangaroos; they are very palatable, particularly the tail, which makes excellent soup, much like what is called hare soup. My friend Willy Hamilton declared he never ate better soup at any dinner party at home. I sometimes made cakes, which were much admired by the visiters at our hut; and it was a fixed rule always to have a large pudding on Sunday, as we were sure to have some of our neighbours with us to dinner. We had an old man who made so good a pudding that we had it every Sunday for six months; and many came to eat of this mess, the fame of which had spread far and wide. We often gave the receipt for it, but no one made it so well as old Williams.

My husband or my brother read a sermon on Sunday; indeed, we kept up the form of a religious service as near as we could. Generally all our servants joined us; but if they did not feel inclined of themselves to come, it was in vain to try to persuade them. I have sometimes seen our neighbours' servants come in also. We had many letters from home, which were a great pleasure to us. We had also received a large box, containing a spinning-wheel and many very useful things, from my mother. She would, certainly, have been pleased had she seen us unpacking it, and examining every thing in it; it made me think of days gone by, when we were children at the opening of a New-Year's box. I am sure we were quite as happy. We received soon after this a box of preserves, and some other articles, from the same kind hand, and they were highly valued, as we could get nothing of that kind at Port Philip. Little or no fruit was yet to be met with in the colony; but in our garden we had some young gooseberry, currant, and raspberry bushes, from which we hoped soon to have some produce. We had also a row or two of strawberry plants.

On New-Year's Day 1841, some of our neighbours came to dine with us. I was very anxious to have either a wild goose or turkey, but none of the shepherds could see one to shoot for me, so I had determined to have a parrot-pie instead; but on New-Year's morning, while we were at breakfast, two turkeys were seen flying over our hut, one of which was immediately brought down. I must describe our New-Year's dinner, to show what good things we had in the bush. We had kangaroo soup, roasted turkey well stuffed, a boiled leg of mutton, a parrot-pie, potatoes, and green peas; next, a plum-pudding and strawberry-tart, with plenty of cream. We dined at two o'clock, a late dinner for us, as twelve is the general hour; and at supper or tea, we had currant-bun, and a large bowl of curds and cream. We spent a very happy day, although it was exceedingly hot; the thermometer was nearly 100 in the shade. Our friends rode home to their own stations that evening; it is very pleasant riding at night after a hot day.

All the stations near us commenced their poultry-yards from our stock. We got 12s. and 15s. a-pair for hens, which was the Melbourne price. Had we been nearer town, we might have made a great deal by our poultry. Eggs are also very dear in town, sometimes 8s. and 10s. a-dozen. I was much annoyed by the hawks carrying off the young chickens. We lost a great many in this way, as we had not a proper house to put them into; but the gentlemen always promised to build one when they had nothing of more importance to do. They rather slighted the poultry, although they were very glad to get the eggs to breakfast, as well as a nice fat fowl to dinner. We never fed the poultry; they picked up for themselves, except when I now and then threw them a little corn to keep them about the huts. They roosted on a large tree behind our hut. I was astonished to see how soon the hen begins to teach her chickens to roost. I have seen one take her chickens up to roost in the tree when they were little bigger than sparrows, and scarcely a feather in their wings. I used often to admire the hen's patience in teaching her family to mount the tree; it took her a long time

every evening to get them all up, for many a tumble they had, and many times she flew up and down for their instruction; but she seemed very happy and satisfied when she got them all under her on the branch.

A melancholy accident happened at a station near us. A young gentleman who had lately arrived in the colony, went to pay a visit there. He jumped into a water hole to bathe; the hole was small but deep. He was well warned of this; but nothing would dissuade him from going in, and he was drowned before any assistance could be rendered. His body was not found for several days, although the hole was dragged with chains; but some natives were set to dive for it, and one of them brought the body up immediately, which was buried next day in a wood near the hut. The funeral was attended by several settlers in the neighbourhood, and the service for the dead was read by the gentleman whose guest the deceased had been. A funeral in the bush is a very rare and a very impressive occurrence. I only know of one other spot where a white man is buried; it is the grave of a shepherd who was speared by the natives some time ago, and the valley where he now lies is called the "Murderer's Valley." I never passed through it without feeling a kind of horror. The grave is fenced in by a rough paling.

In the bush no one is ever allowed to go from a hut without eating, or remaining all night, although an entire stranger. We were once sadly deceived by a man who walked into our hut, and introduced himself as a new settler who had come to our neighbourhood. None of us were acquainted with him, but we very soon saw he had not the manners of a gentleman, although he was perfectly at ease, spoke much of his large herds of cattle, and the difficulty he had in bringing his sheep up the country so as to avoid the different stations, as there is a heavy fine for any one driving scabby sheep through a settler's run, except during one month in the year. This pretended gentleman also talked as if on intimate terms with one of the settlers we knew, and told us much news, some of which astonished us not a little. He dined with us, and begged to know how the pudding was made. I offered to write him the receipt, which I did, although I am sure he could not read it. In a few days we heard he was a hut-keeper, and an old prisoner, who had been sent by his master to tell us he had some young bullocks to sell, as he knew we wanted to purchase some; but this message was delivered to us as a piece of news. I was rather annoyed at being deceived in this way; but in the bush it is no easy task to tell who are gentlemen and who are not from their dress, or even manners, as a few of them pride themselves in being as rough as possible.

We began to think that there were too many masters at one station; and my husband's relations at home had expressed their surprise that he did not leave the young men to manage the station, and find something to do near a town. The situation of his family induced my husband to think seriously of this proposal; but the only happiness I had in the idea of leaving the station was, that I should be able to pay more attention to Agnes, who was now four years old, and almost running wild. In short, for one reason and another, it was resolved that we should seek a new home; and for that purpose my husband proceeded to Melbourne to make necessary inquiries. After an absence of three weeks he returned, having taken a farm in the neighbourhood of Melbourne, to which we were immediately to proceed. This proved a fatal step, and the beginning of many misfortunes; but I shall not anticipate. My husband brought with him our old friend Mrs Scott, who had come to see us before we left the station, and she remained till the day of our departure, accompanying us on the journey.

Accommodated in a spring-cart, which was provided with a few necessaries for our use, we departed from the station on the first morning of sheep-shearing, and certainly not without a degree of regret, for, all things considered, we had enjoyed at it a happy bush life, to which I now look back with pleasure. It was early morning when we set out, and the first place at which we stopped was the station of Messrs Donald and Hamilton, where we breakfasted, and found a hearty welcome. From this we proceeded to the station of my brother Robert. Fortunately, we found him at home, but quite alone; not even the hut-keeper was with him, as he had taken the place of a shepherd who had run away. The two little huts were perched on the top of a steep bank or craggy rock, at the bottom of which was a deep water hole. It had the strangest appearance possible; at a little distance it looked not unlike a crow's nest, and must have been a very dismal place to be left alone in for such a length of time as my brother occasionally was. I was very sorry for him, and did not wonder at his complaining of being dull sometimes. I told him we had come to lunch with him, but he said he hoped we had brought the lunch with us, as he had nothing to give us but damper. The rations were done, and more had not come from the home station. We were well provided in the spring-cart; so Robert and I laid out a lunch, and he took a damper he had made out of the ashes. We could not remain with him very long, as the day was pretty far advanced, and we wished to get to Mr Anderson's station, where my husband had promised to remain a short time, as Mr Anderson was ill at Geelong.

Before we had got above four miles from my brother's, the wheel of our cart, in going through a creek, got into a hole, and the vehicle was upset. We were all thrown into the water, but were not hurt, and our greatest difficulty was getting the cart up again. We had to take out the horses, and get into the water and lift it up, as it lay quite on its side. It took all the party's united strength to lift it. We were quite wet already, so we did not mind standing in the water to do this duty; it was rather refreshing, the day had been so hot. I undressed my infant, and rolled him in my cloak, but all the rest of us had to sit in wet clothes; we were so much pleased, however, at getting up the cart that we did not think much of it, and were congratulating ourselves on our good fortune, when, in going up a very stony hill, down it went again. I felt much stunned, as I was thrown with my head on a stone; but I was not insensible. The thought of my infant was uppermost; he was thrown several yards out of my arms, but the cloak saved him. He was creeping off on hands and knees out of it, quite in good humour, as if nothing had happened. Agnes was also unhurt, except a bruised cheek, but she was much concerned about a kitten she had got from her uncle Robert, which was squeezed under a carpet-bag. The most unfortunate of our party was poor Mrs Scott, who was thrown violently on the ground, and lay seriously stunned. On inquiring into her condition, she said that her leg was broken, and in great pain. This was terrible news in such a place as we were, but on examination the case was not so bad; the knee was out of joint, and her ankle already much swollen from a very bad sprain. By her own directions, I pulled her leg till the knee-joint went into its place. She had been thrown with her head down the hill, and she suffered so much pain that she could not allow us to move her, but we propped her up with stones and a carpet-bag; and what more to do we could not tell.

We were far from help; it was already nearly dark, very cold, and we had nothing to light a fire; in a word, we were in a miserable state. My husband at length remembered an out-station of Mr Learmonth's, not above half a mile from us; he immediately went there for help, and two mounted police happened fortunately to be at hand. One of them rode back for my brother Robert to come to us, and the other assisted my husband to carry Mrs Scott on a hurdle to the shepherd's hut, while I went on before with the children, to try to get a bed ready for her. The walk put my baby fast asleep, so I laid him down in a corner of the hut, wrapped in my cloak, while Agnes went to the fire to dry her clothes, not looking very contented. The shepherds were very kind, and gave up their hut to us at once; and the old hut-keeper begged me to let the poor sick lady have the best bed. I looked at the beds, but it was really difficult to say which was best, as one was an old sheep-skin, and the other a very dirty blanket, spread on some boards. I chose the sheep-skin for Mrs Scott, and my husband carried her into the hut and laid her on it. By this time my brother Robert had arrived with a bottle of Scotch whisky which my husband had left with him. Mrs Scott took a little of it, which appeared to revive her, for she seemed in great agony from being moved. Her knee was continually going out of joint when she moved, so I split up the lid of an old tea-box I saw in the corner of the hut, and bound the pieces round her knee with a bandage made of a part of my dress; and I succeeded better than I expected, as it did not again come out of its place. I never saw any one bear pain with more composure and cheerfulness than my poor friend. My brother rode on to tell Mr Scott, and to get a doctor from Geelong. I bathed Mrs Scott's ankle often during the night with some hot water in which meat had been boiled; it was the only thing I could get. It relieved her for a little; but we passed a sad night, as we had no dry clothes. My husband was also much bruised, and the horse had trod on his foot, which was very painful; but he said nothing about it till next day, when he could scarcely put his foot to the ground.

The hut to which our misfortunes had thus conducted us was a miserable place, and I was afraid to try to sleep, there were so many rats running about, and jumping on the beams across the roof. I was, however, very tired, and unconsciously fell asleep for a little, but when I awoke three rats were fighting on the middle of the floor for a candle I had lighted and placed there stuck in a bottle, there being no candlestick. I rose and separated the combatants. Poor Mrs Scott had never slept; she said a rat had been watching her all night from the roof. The rats here are very tame and impudent, and not easily frightened, but are not so disgusting in appearance as the rats in England; they are larger, and their skin is a beautiful light grey. I shall ever remember this dismal night, which seemed protracted to an unusual length. Day at last dawned, and allowed those who were able to move about, and render assistance as far as circumstances would permit. With the help of the shepherd, I prepared breakfast, and afterwards dinner, for the party. We were much afraid, when the afternoon arrived, that we should have to pass another night in the hut; but at four o'clock, greatly to our delight, Mr Scott made his appearance, and soon after a dray, in which a bed was placed for Mrs Scott. It was with difficulty she was lifted into it. I sat beside her with the children, and my husband sat on the other side to keep her steady. Mr Scott was on horseback. In this way we arrived at Mr Anderson's station late at night, as we were obliged to travel very slowly on account of our unfortunate patient.

We found Mr Anderson's hut locked up, and the keys were at Mr Yuille's, three miles off. However, my husband opened the window with little difficulty, as it had no fastening; so it seemed of little use having the door locked. We soon got a fire lighted by his woman-servant, and had tea and nice comfortable beds, which we indeed much required. Mrs Scott was taken home next day, but many months elapsed before she could walk about. We remained at Mr Anderson's station a short time. While there, we went over to dine with Mr Yuille. I saw many improvements about his station, but his own hut was still without windows. I expressed my astonishment at this, but he said he had been so long without them, that he would still continue so, and he did not see the use of them. We ate some of the largest lettuces here I ever saw. Mr Yuille takes great pleasure in his garden, and keeps it in order entirely himself.

We were now in the Boning Yong district, which takes its name from a very high mountain, on the top of which is a large hole filled with water. It is quite round, as if made by man, and there are fish and mussels in it. Boning Yong is a native name, and means *big mountain*. I like the native names very much; I think it a great pity to change them for English ones, as is often done. Station Peak is also a peculiar-looking mountain, and is the boundary between the Melbourne and Geelong districts.

We spent several days at Mr Scott's station, which is for cattle and dairy-husbandry. He had some of the finest cows I had seen in the country, and the dairy was well managed by a young woman, whom the family had brought from home; and they fortunately did not require to keep many servants, the children were so useful, and never idle. His two little boys managed the cattle as well as any stock-keeper could do, and every thing seemed in a fair way of prospering at the station. A large family in these colonies is a blessing and fortune to their parents, if well-doing.

In travelling down to Melbourne, we did not require to sleep in the bush, as there are now several public-houses on the road. The first we came to was not at all comfortable; and the keeper performed the paltry trick of hiding our bullocks, thereby compelling us to remain at his house till they were found, which was not accomplished until we offered a reward for them. We heard many complaints of "planting" bullocks (the colonial expression) at this house. We were more fortunate in the next we arrived at, in which we slept one night, and were exceedingly comfortable; it is kept by a Dr Grieve. On leaving next morning, Mrs Grieve gave me a nice currant loaf for the children to eat in the dray.

I was astonished, when I visited Geelong on our way down, to see the progress made in building. I had not seen it since we first landed in the country, at which time three stores were all the buildings in the township. Now, it is a large and thriving place. Such is the rapid way that towns get up in this new and enterprising colony.

A CHINESE BREAKFAST.

[From Mackenzie's "Second Campaign in China."]

NEXT morning we all landed about nine o'clock, A.M., in various boats, some belonging to the steamers, others provided by Keshen. The landing-place was situated about a quarter of a mile up one of the numerous creeks on the banks of the river. On approaching, our attention was much attracted by the various handsome boats in which Keshen and his suite had come down from Canton. They were all brilliantly painted, and decorated with elaborate carving and gaudy flags. The landing-place was enclosed by a slight bamboo railing, which served to keep off the disorderly rabble with which China abounds. It was roofed over, and covered with plantain leaves and cloths of the brightest colours. Under this the guard of honour and band were drawn up to receive the plenipotentiary. While the officers remained waiting his arrival, our time was fully occupied in examining the boats and preparations for our reception. The tents in which the interview was to take place were about 300 yards distant from the landing-place, and were surrounded with smaller tents for Keshen's guard of Chinese soldiers, and as quarters occupied by his suite. A raised platform of bamboo served as a causeway between the landing-place and tent. On Captain Elliot's arrival, he was received with the usual honours; and we then marched off to the tents, the band preceding us. Keshen received us in a handsome outer tent, lined with yellow, the imperial colour. His appearance is that of a man about fifty; but he is, I believe, much older. His manners were very dignified, and he received us with great courtesy and politeness, without any of the false shame that recent events might be supposed to have given rise to. His dress was plain but handsome; the outer jacket was of the finest sable; and a cap, with a dark red button and peacock's feather, served to denote his exalted rank. On this occasion, however, he did not wear his court button, but one of more common material. We were all presented to him individually by Captain Elliot, Keshen at the same time referring to a list of our names and ranks in Chinese, which had been forwarded to him the previous evening. After this ceremony was over, Keshen invited the plenipotentiary and a few other officers into an inner tent, where we found chairs arranged on each side of an ottoman, upon which Keshen immediately seated himself, in the manner in which tailors are wont to pursue their laudable vocation, his staff standing around him. We sat on chairs—Captain

Elliot on the left, and the Hon. Captain Dundas on the right, the former being looked on in China as the seat of honour. Mr Grey, a young midshipman of her Majesty's ship Herald, son of the late Bishop of Hereford, had accompanied his captain; and Keshen took the lad and placed him at his side, commencing a series of questions relative to the boy. Captain Elliot mentioned that Mr Grey was nephew of the late prime minister, at which Keshen seemed pleased, and inquired his age. On being informed that he was only fifteen, he remarked, that one so young would be much better employed at home in learning his books than in learning the use of his sword. A desultory conversation then ensued, during which servants entered with refreshments, which were served in a variety of cups, of all shapes and sizes, made of the most delicate and transparent china; this was followed by tea *a la Chinoise*. After this, Keshen said that he had ordered breakfast to be prepared, which being ready, he begged we would partake of it, and immediately bowed out Captain Elliot and all by whom he was attended. On retiring, we were shown into the tent we had first entered, and found four tables set out, each capable of accommodating six persons, which made up the exact number of the party. I regret having been unable to procure a copy of the bill of fare on this occasion, while, to endeavour to describe the various dishes would require the talent of a Ude, and many of them would not tend to elevate the Chinese gastronomic art in the estimation of my readers; suffice it to say, that most of them were excessively fine. Among others, I would particularly recall to pleasing recollection the partridge soup and pheasant breast sandwiches, as also the preserves and dessert, which were delicious. In addition to the usual European, we had a weak Chinese wine, heated, and handed round in small cups, the attendants pressing us frequently to drink, and seeming to think that a glass of something was necessary to assist our masticating labours. Having eaten as much as I felt inclined to partake of, I endeavoured to effect a retreat, but was stopped by a servant who spoke a little English, and to my horror was informed by him that breakfast was not half over. Unwillingly I followed him again to the table, where I found, to my surprise, a course of at least two dozen different dishes set out, among which was the celebrated bird's-nest and shark's-fin soup. Having at length finished breakfast, we adjourned to the open air, and found that Keshen—

> While he feasted all the great,
> *Had not* forgot the small,

having provided a good and substantial breakfast for the marines and band. During the time occupied at breakfast, Keshen was employed in examining the arms of the marines and the instruments of the band. Nor was his curiosity confined solely to the weapons of defence used by the privates, for he sent to me to request to be allowed to examine my sword. Whilst unclasping its belt to comply with this request, I was amused by the exclamation, "See also *my* sword!" which proceeded from my neighbour, Captain Rosamel, who, when informed of what was passing, detached his own sword from his side, and insisted upon its also being subjected to the inspection of our curious host; thereby exhibiting a striking instance of his correct appreciation of the balance of power, so much esteemed in Europe. While wandering about, we walked into a house, which, to our surprise, we found tenanted by the Hong merchants, who, being habited in full court dresses made of silk, richly embroidered, formed a very pleasing addition to the pageant. They were headed by Howqua, the senior Hong merchant, an old man of seventy-two, possessed of enormous wealth; and who, if report speaks correctly, was squeezed for the expenses of this day's entertainment. In China, where the mandarins retain their appointments for three years only, the general policy of these officers is to squeeze or extort as much as they can from the people under their rule—a procedure they have recourse to in consequence of the low scale of their official salary. Nor is it to be wondered at that by this means they not unfrequently amass enormous wealth. On our return to the tents, Keshen expressed a wish to inspect the marines. They were accordingly drawn up, and marched past, put through the manual and platoon, with some other simple manœuvres, and as Keshen came down in front, to open order, and presented arms. All this would have been perfect, had not a row of unfortunate Chinese soldiers been drawn up close in the rear, who stood looking on with great gravity, totally ignorant of the nature of the movement: consequently, as each rear rank man stepped back, he trod on the toes of a Chinaman, who, of course, commenced jumping up, thereby producing an effect something similar to the keys in the interior of a piano. Keshen was much struck by the appearance of our men, whom he seemed to suppose were padded, for he felt their arms and chests; and even to the innate pride and self-sufficiency of a Chinese mandarin, the contrast between our men and his own body guard (who, although not deficient in height, were miserable objects) must have been striking. Shortly after this, we took leave of Keshen, and returned to the steamer, leaving Captain Elliot with the commissioner to arrange public affairs.

THE ROMANCE OF LIFE.

Some short time ago, in one of the villages on the Firth of Forth, lived a lady whose husband had long before gone to sea; and never having heard from him for some years, she believed him to have been dead. At the time her husband went to sea, Mrs S. lived in a town in England; but after giving up hopes of his return, she removed with her only daughter to her native country, Scotland. In the course of years, a probationer of the Church of Scotland came to officiate as a missionary in the parish, and formed an attachment for Miss S. Seeing no immediate prospect of obtaining a church at home, he resolved on transferring himself to one of our American colonies, and received an appointment there from a colonial missionary society. Having been united to Miss S., he took his departure, leaving his wife and mother-in-law to follow as soon as he should have prepared for their comfortable reception. They accordingly left this country some time afterwards for America. In the meantime, among the settlers over whom the young divine's charge extended, was a comfortable farmer, also named S., who made inquiries after the history of the minister's wife and her mother, and expressed an anxious desire to see them on their arrival. They did arrive safe; and on reaching the minister's habitation, Mr S. was sent for to be introduced. Judge of the surprise of all, when, on the entry of Mr S., the newly-arrived females found in him the long-lost husband and father! Having been unable to trace his family in England after a protracted absence, he had returned to America, where, by a singular coincidence, both he and they found those they had given up as lost. The parties, we are glad to say, are now living comfortably and happily in the New World.—*Edinburgh paper.*

CONTAGION AND QUARANTINE.

[From the *Medical Gazette.*]

We marvel much at the tone and temper with which this controversy has been too generally conducted. A certain class of pathologists has imbibed a sort of instinctive horror at the notion of contagion. They have considered it as beneath the dignity of a scientific man to acknowledge such an influence. They have reasoned as if there were some confession of intellectual superiority attached to the holding of such an opinion, and an emancipation from vulgar prejudices in the avowal of anti-contagious notions. Such men would, we sincerely believe, experience a sense of shame in acknowledging the doctrine of infectious agency. That such feelings as these do exist widely throughout the world, more, perhaps, on the continent than here, we are well convinced, and it is hard to account for such a circumstance. There seems nothing, *per se*, very revolting to common sense in the notion that the secretions of the body, in certain disorders, throw off emanations which, received into the lungs, and impregnating the blood of another person, should produce in him a like disease. Yet the great aim and object of certain parties has been to disavow such a principle, wherever, by any ingenuity, it was possible to adopt some other explanation; never to admit such a doctrine except as a last resort in ætiological difficulty, and then to throw all possible discredit upon it.

The doctrine of a contagious and infectious quality is conceded to small-pox and measles by almost all pathologists, a large proportion of whom are ready to extend the same attributes to scarlet fever and hooping-cough. Very many draw their line of demarcation here, and, like Falstaff with his ragged regiment, refuse to march a step farther with the contagionists. A certain number, however, are content to include typhus fever, puerperal peritonitis, and the Egyptian plague, in the category of contagious maladies. From this point the non-contents have it pretty much their own way. The doctrine of a contagious quality inherent in the morbid secretions of cholera, of yellow fever, of erysipelas, and of influenza, makes some of them perfectly frantic, while the suggestion that perhaps the secretions may be similarly endowed in cases of phthisis pulmonalis, croup, or dysentery, is met with a look of ineffable contempt, mixed with pity.

It has always appeared to us that the doctrine of contagion and infection has been viewed by medical writers in too isolated a manner; that to arrive at correct conclusions on the subject, capable of any wide application in nature, we should commence with the simplest form of diseased secretion capable of communication from one individual to another of the same species, and trace the doctrine up to the more aggravated forms of disease.

Entertaining these general impressions on the subject of contagion and infection, as applicable to various acute diseases where the secretions of the body are palpably affected, it cannot be a matter of surprise that we are strenuous supporters of the contagious nature of the Turkish plague. If ever a disease existed, calculated, *a priori*, to throw off contagious emanations, this is it. It is a peracute form of fever of most malignant character, rapidly affecting the nervous and circulating systems, and curiously altering the coagulable and other qualities of the blood.

One argument of the anti-contagionist party is, that plague is not found to spread on the European Continent, though commercial intercourse with Egypt augments annually. Historical facts, however, are opposed to this statement. Plague spread at Marseilles in 1720, at Moscow in 1770, at Malta in 1813, and in the Ionian Islands in 1818.

While we thus acknowledge our firm belief in the contagious qualities of the secretions that form in persons labouring under Turkish plague, and our equally strong conviction that the clothes, and bedding, and bed furniture of plague patients may sometimes harbour such diseased secretions, and renew the disorder after a certain interval, either in the same or in a distant locality, we are perfectly ready to admit that the quarantine laws, as now administered in the Mediterranean, are framed upon very mistaken views of the laws of pestilential contagion. The shortness of the incubative stage is not considered. The almost total impossibility that merchandise could be packed by persons in a condition calculated to throw off contagious emanations, seems utterly neglected. The practical inference deducible from the fact that the crew of a merchant ship remains free from disease for a period exceeding ten days, appears an element in the calculations of quarantine law-givers wholly and most unaccountably left out of consideration.

We earnestly hope that the British government will be induced to take some efficient steps towards the reform of the quarantine regulations now in force throughout the Mediterranean. That the period of sanatory surveillance might be lessened in all cases, with perfect safety, we entertain not the smallest doubt. That the period should be the same in steam and sailing vessels, appears a wanton trifling with valuable time. No isolated measures for the reform of quarantine laws, however, can be of any avail. To be effective, the subject must be taken up as a measure of international policy, and carried out with entire acquiescence on the part of all the chief Mediterranean powers.

TRAITS OF ENGLAND.

The waste of horse labour in England is prodigious. In ploughing, never less than three horses, and often four and five, are engaged. In one small field we observed four ploughs at work, two of which were drawn by four horses, and the other two by three each! Thus fourteen horses, four men, and four boys, were employed to accomplish what a Scottish farmer would have done better, in little more time, with two horses and a single man. In another field we observed a team of *six horses* drawing a harrowing machine! No good reason can be given for this excessive waste of animal power: the English farmer plods on as his fathers did before him; and to all remonstrances he returns, what we found to be the universal answer, "Lord bless you, sir, it will never do to distress the horses." The "turn out" along the roads is imposing: the horses are yoked *a la tandem*, in a row, and the ploughman stalks loftily along, in his smock frock and half boots, cracking his huge whip by the side of the horses, while a boy leads them in front. Another peculiarity in some of these midland districts is the quantity of land still cultivated in the common field style, or *run rig*, as it used to be termed in Scotland by several tenants or small proprietors. Each has his own number of furrows, separated from that of his neighbour by a strip of green sward, and the appearance of the fields divided in this way, with walks between the *rigs*, is singular enough. We say nothing of the loss of ground: the farmer never thinks of arranging with his neighbours to alter the system, because he says they must cultivate the lands in that way till there is an act of Parliament to enclose them. Nothing can exceed the beauty of the fields around Kenilworth and Warwick. They are well cultivated, and enclosed by neat hawthorn hedges and elm trees. Around Stratford-on-Avon there is the same rich appearance; but, proceeding on to Oxford, more barren land and more careless farming are apparent. From inquiries of a farmer, we learned that on rich soils in Warwickshire they take three successive white crops after one-year-old grass: first, oats; second, wheat; third, barley; then two green or clearing crops, namely, beans or peas, and afterwards turnips. The turnips are pulled, cleaned, and cut, and then given to the sheep and cattle. The "woolly people" eat them from troughs placed in folds; and by shifting the latter from time to time the ground is manured. The crop after the turnips is generally wheat, and is laid down with grass. We were struck with the number of bean fields along the sides of the public roads. Beans are considered a better clearing crop than turnips; they are hoed four or five times in the season, and are excellent food for fattening hogs. The value of land is very unequal: in one place it rents at 16s. per acre, and in a mile or two at 45s. There is undoubtedly a greater air of comfort about them all than in our northern region, though there is far less display of scientific skill or prudent economy. The condition of the labourer is about the same as in Scotland, or rather better. Wages run from 10s. to 12s. a-week; but where there is a family, the difference in the price of bread from that of oat-meal will be equal to the difference in amount of wages.—*Inverness Courier.*

INDIAN MODE OF TRAINING HORSES.

According to Mr Catlin, the Indians possess the knack of subduing and taming the wild horses of the western states, by covering the eyes and breathing into the nostrils. Since this remarkable practice was made known in England, it has been tried on various vicious horses, and, as we understand, with perfect success. A person connected with a dragoon regiment writes to inform us that the attempt was made on a horse which it baffled every one to tame, and it had the desired effect. In a late newspaper, it was mentioned that the process had been tried by Mr Ellis in Yorkshire, and with singular success. "One of the animals experimented on was remarkably headstrong, and apt to rear and kick with his fore feet, rendering it extremely difficult to get at his head, which was only effected by climbing a tree to which the filly was tied, and leaning over as far as was practicable. The moment one nostril had been breathed into all was easy. 'W——, who is very skilful in the management of a horse, coaxed it, and rubbed its face, and breathed from time to time into the nostrils, while the horse offered no resistance. In about ten minutes he declared his conviction that the horse was subdued; and he then unfastened it, and, to the great and evident astonishment of the owner (who had been trying all the morning in vain to gain a mastery over it), led it quietly away with a loose halter. Stopping in the middle of the field, with no one else near, he quietly walked up to the horse, placed his arm over one eye, and his hand over the other, and breathed into the nostrils. It was pleasing to observe how agreeable this operation appeared to be to the horse, who put up his nose to receive the 'puff.' In this manner he led the horse through all the fields to the stable-yard, where he examined the fore feet, and then the hind feet of the horse, who offered no resistance; but while he was examining the hind feet, bent his neck round, and kept nosing his back. He next buckled on a surcingle, and then a saddle, and finally bitted the horse with a rope. The horse did not offer the slightest resistance, nor did it flinch in the least degree.'"

We hope veterinary professors will make inquiries into this at present incomprehensible means of training horses, and give the world the benefit of their labours.

NUMBER 546. SATURDAY, JULY 16, 1842. PRICE 1½d.

SUPPLEMENTARIES.

ONE often meets in the world with individuals who are generally estimable, and perhaps superior in most points to their neighbours, but who are strangely deficient in some single department of character, or perhaps possessed by something of the nature of monomania, so that much of what is good about them goes for little or nothing. Perhaps this sort of person gives us even a more affecting sense of human infirmity than those who are thoroughly bad, just as we more poignantly lament the defeat of a candidate by a majority of one than we do the non-success of one who never had any chance, or at a regatta pity the honest fellow who only loses the race by half a boat's length. There is also an unfortunate class of cases where the intellect is all very well, except for a certain inaptitude or blindness on some points, as if they had been subjected to the deduction of a small discount before being sent into the world. All this is very distressing to reflect upon, and must be extremely inconvenient in many instances to the parties; but amongst people of a certain rank in life it is not perhaps irremediable. It occurs to us that, for those who can afford it, there might be a class of functionaries who would greatly, if not altogether, remedy the defect or aberration. To this class of functionaries we would give the title of Supplementaries.

For example, we shall suppose a married lady who was in all respects a crown to her husband, as the old epitaph has it, excepting that she was totally deficient in a sense of time, so that she never was punctual as to any duty or engagement. All that would be necessary in this case would be to keep a Supplementary. It would be the first qualification of this person to possess an uneasily exquisite sense of time—to be, in fact, an animated piece of horological machinery. Taking a survey of a day's duties, the first would of course be to admonish the lady of the proper hour to rise, and, more than this, to take care that she did not fall back upon an unfinished slumber, but did actually get up. Once up and afloat in the house, and supposing her to be a person who was not above seeing that all things were ready in time to allow of her husband breakfasting and getting away in time to business, she would require a few occasional admonitions from her Supplementary as to the various affairs therewith connected. In the course of the forenoon, she would perhaps need a touch of the hour-hand of her Supplementary, to enable her to dress in time for shopping, morning calls, and all that sort of thing. On any day when she had appointments, it might be necessary for her to be accompanied by the Supplementary, who would sit by her side while she was chatting with her friends, and tell her when it was time to take leave and be off to another place. The husband would find the benefit of the Supplementary's services in a particular degree when he and his lady had to go out together, whether to a walk, or a call, or a party, as the necessity for his urging her to begin in time to dress, and dragooning her all the while to dress with dispatch, would be taken entirely off his hands, and he might not have to spend a half hour in fretting and kicking his shins in the lobby above once in a twelvemonth. He would also relish very much the certainty of finding dinner ready, and his wife ready for it, on his coming from the office, and still more particularly the repose of mind which he would have whenever he expected company, being quite sure that all culinary and other preparations would be duly made, and that the appearance of his dame to take up a position in the drawing-room would be never less than five minutes before the first rat-tat-tat at the door. The services of so useful a person could not of course be obtained for nothing; but, considering what a saving these would make in tear and wear of soul and body together, they would be well worth the money. The only difficulty in such a case would be as to the sex of the Supplementary. A female would be preferred, as the advertisements say; but a female with a sense of time might not be easily had. It seems to have pleased Providence so to constitute the female mind, that it both wants a sense of time itself, and has the power of bewitching that sense out of the opposite sex. We foresee that a man Supplementary in so confidential a place would be objected to, and yet there might be no alternative. What, then, shall we say? Let us take refuge in the useful and respectable quality of age. Some withered, formal little man, going about the house like an old worm-eaten eight-day clock, as he was, would not be a very formidable idea; and such men, with well-attested characters, could be had with no great difficulty.

Some other ladies make extremely good wives in all respects excepting a sad want of order. Studious ladies have a bad character in this respect: it seems settled in moral chromatics that the complementary colour of *blue* is *drab*. But many ladies, without being at all literary, contrive to be amazingly litterary—leave their clothes lying about in their rooms, keep awful-looking toilette tables, and, instead of ever putting any thing to rights, are constantly putting wrong just as many things as possible. This class of ladies usually have enough of respect for the world's opinion to dress in the most splendid style they can afford, and keep very superb public rooms for the reception of company. But all the rest of their houses, and all the time which they spend in privacy, are marked by slovenliness inexpressible; the lucid interval being somewhat like a winter day in northern latitudes, in comparison with the long night of untidiness and trumpery. Charming women in all other respects, affectionate wives, good mothers, and ornaments to society, the expense of a Supplementary to make them quite perfect would be well incurred. Such an official would require of course to be a paragon in that very quality which the principal party wants. A sense of order so painfully nice that a thread lying on a carpet produced discomfort, and a dusty table untold agonies, would be the grand qualification. It would be necessary to produce certificates of several genuine faints at dusters left on ottomans till the calling time of day, and children ushered into company without a proper attention to something more than the *counting* of noses. Here there would be far less difficulty in the choice of an official than in the case of the Unpunctual Lady, for the female sex have that almost monopoly of order which the other have of time. A good female Supplementary for the Disorderly Lady might be got for little more than the salary of a lady's maid. It would be necessary, however, that, as in all other cases, she should be invested with an unlimited authority. She would need to be regarded, not as a servant, but as a kind of duenna or governess. A husband truly anxious about the good order of his wife's person and household, would allow a very large latitude in her instructions. A power of forcing the unfortunate gentlewoman into clean linen whenever it was absolutely necessary, and of dictating the proper hour for the exchange of the wrapper for the gown, would be amongst the simplest parts of her prerogative. Where there was a very inveterate propensity to sitting up to the knees in confusion in a frowsy bed-room, all the time that a clean and smiling parlour was left unoccupied, the Supplementary would need to have it in her power to summon the whole forces of the house to commence cleaning up, brushing here, scrubbing there, kicking up all possible dust—in short, doing every thing to render the lady's position intolerable, so that she would be in a manner hunted down stairs. If, again, any unhappy disposition was shown to relapse in the evening into wrappers and night-caps, on a plea that it was not worth while or necessary to keep on dress merely for one's husband, the Supplementary ought to be enabled to keep the said wrappers and night-caps under lock and key, until the proper hour for undressing had arrived. Our functionary would of course have an absolute right to interfere in all cases of rent shawls and stockings, and even to withhold food, or lock up in a dark closet, until the fault had been remedied by the lady's own hands. Let it not be thought that this would be treatment inconsistent with the condition and style of living of a full-grown lady: the object, we must remember, is to correct and improve habits, and it might be hoped that a very few inflictions of the punishment would be sufficient. If, however, any decided objection was felt to this stretch of authority, the Supplementary might merely keep a record of delinquencies, which, being represented by numbers, would be reckonable at the end of each week, when some less severe punishment might be inflicted by the husband. Appearing *en papillotes* might, for instance, count 2; leaving out a petticoat on the floor, 3; mislaying keys, 6; and so on. Having 30 of an aggregate in a week might be held to infer a penalty of a certain class; 50, one of a higher class; and so on. The nature of the punishments would need to be adjusted with a regard to the tastes and inclinations of the lady; but a series, consisting of a denial of new dresses, would be pretty sure to meet the majority of cases.

There is a class of gentlemen who are excellent persons in all respects, except that they are totally deficient in a sense of the value of money. The consequence is, that they are remarkably indifferent about the proper means of gaining the world's pelf, and remarkably free and easy in spending it. And, more than this, by an apparent contradiction, which practically is found to be none, they contrive to spend a vast deal of money which they never gained at all. In men otherwise so extremely agreeable and worthy, this is a very lamentable thing, for somehow the bulk of mankind regard it with extreme severity and intolerance. There is, indeed, scarcely any little failing of human nature which suffers so much downright actual persecution as this blindness to the value of money. Men are hunted for it out of society, have to go to the continent, or no one knows where, in consequence of it: in short, it brings them into the most dreadful scrapes. This is evidently a class of cases where a Supplementary would be of the greatest service. He should be a sort of live ready-reckoner, always at the elbow of the party. The great difficulty would be to operate so far upon the reason of such a gentleman as to induce him to put himself under the guidance of the requisite official. But, supposing that he was brought to this point, how much benefit might he and all his immediate connexions, as well as his descendants, derive from a really right Supplementary! He would never feel inclined to build, or plant, or improve, but his Supplementary would be instantly at his elbow, with a prospective view of the cost to set before him. He might feel the strongest tendency to the turf or to Melton Mowbray, but the Supplementary would quietly tell him it would not do. Was the purchase of bijouterie, or pictures, or articles of virtú, his craze, he might walk through unlimited bazaars, arcades, and auction rooms, and, so that his Supplementary stuck fast to him, he would be quite

safe. If he wished to entertain his friends, and thought of a champagne supper, the faithful Supplementary, with one shake of the head, would bring him down to a dinner of plain roast and port. Did a vision of a new britschka rise on his morning dreams, the honest Supplementary would join him as he descended to the breakfast parlour, and dispel the perilous fancy in a moment. In short, the Supplementary would keep such a man quite right, at a mere trifle of expense compared with the sum saved, and a worthy man would be preserved to his wife, children, and the world, instead of going himself, and sending every thing else, to the dogs.

Another and opposite class of men would need a Supplementary fully as much, at least for the sake of their own credit: that is to say, the stingy and miserly would need one to admonish them when they ought to spend and be generous. But it is vain to hope that men of this order would ever take a Supplementary into their pay. The spendthrift might possibly submit to the companionship of a person who was to save him from himself; but the niggard would boggle, at the very outset, at the salary, and prefer going on saving his money, and sinking his name, and perishing his soul.

There is a vast number of other cases in which a Supplementary would be useful. We submit that a bashful man would be much the better of one possessing a good stock of assurance, to spirit him on to address the fair when it was proper to do so, and to give him some little confidence in his own powers when he was likely to slink aside from a race in which his competitors were, manifestly to all but himself, inferior. Supposing bashful men generally to adopt the custom, we might expect some interesting statistical tables from Mr Farr as to the increase of marriages—a kind of result which might obviously be expected to be still further swelled, if ladies also were to keep Supplementaries to whisper to them when they ought to say *yes*, when they might otherwise be apt to say *no*. Young ladies might advantageously retain officers of this kind in their pay to tell them when they were laughing too loudly, or looking too happy; and, perhaps, it might not be amiss for some young gentlemen to keep a very small but quick-witted Supplementary, to put them on their guard against being stupid or frivolous, and hint ideas for them to operate upon in their endeavours to pass for smart fellows. Absent men would need Supplementaries to tell them when some one was speaking to them, and to admonish them that they were on the point of walking out in a shower of rain without putting on their hats. Clever people, whose only fault it is to speak eternally, to the exclusion of all conversation, would evidently be much the better of Supplementaries, just to make them aware that some other person might have something to say as well as themselves. Bores, who tell awfully long stories, would require similar service to admonish them of a tired audience. The long-tongued and empty-headed in general should be attended by Supplementaries; and it might be suggested that, as a public interest is here as much concerned as a private one, part of the expense ought to be borne by contribution, or out of the Consolidated Funds. But any such provision would obviously be improper in such a case as that of a young man of fortune, destitute of sense, manners, and discretion; as, in the first place, it is greatly doubtful if his deficiencies are at all remarked; and, in the second, if he chose to have a little judgment supplied in this way, and found himself thought the better for it, it must be so great an addition to all his other advantages, that, considering how rich he is too, he is well entitled to pay for it out of his own pocket.

When a case unluckily happens, as it sometimes will, that one whom birth entitles to place and influence is either not bright or not disposed for trouble, it is clear that he ought to have a good Supplementary engaged for him from the very dawn of existence. At school this person should learn all his lessons for him, take all his whippings, and fight all his quarrels. He should afterwards see him well through college, enjoy a tour of the Continent for him, and be ready to supply all the knowledge and affectation of taste which a young man ought to have. He should see to keep his principal out of all frolics of a positively dangerous nature, select his party, direct his vote, and supply thought and reflection in general upon the shortest notice. Such an arrangement would be in its way perfect—the Supplementary enjoying a good salary, and the principal having a tolerable reputation for sense and information, as well as for things of more importance.

We might easily run over a number of other cases in which Supplementaries would be useful, but it scarcely can be necessary when every one is able to think of them for himself; and, to tell the plain truth, we are not quite sure that the reader may have thought so from the bottom of the first column, and may have been remarking to himself ever since then—"Why, our journalist would not be the worse of a Supplementary himself, just to tell him when it is time to stop."

NORTHERN COLLIERIES.

SECOND ARTICLE.

We now suppose the colliery in full operation. The shaft is sunk to a good seam of coal, and the only objects now in view are to keep out the water, to ventilate the mine, and to raise the coals, as well as to "raise the wind" and the price. To become acquainted with the mode of descending and ascending the shafts, let us follow the colliers from their homes at four or five o'clock in the morning. To the pit's mouth they are seen flocking from all quarters. Station yourself at the pit's mouth, and gaze around at them. In companies of three and four, they swing along with that peculiar gait consequent upon their vocation. In dingy flannel dresses do they approach, with a pipe in each mouth; with one hand in a side pocket, and with a Davy-lamp in the other. They are cracking their dry jokes as they mount up the heap of ashes around the pit, and they continue them as they tarry on the surface, till their turn for going down arrives. These men are the "hewers" or actual workers of the coal. Their tools, which are simple and few, have been sent down before them. They have all a word to say to the "banksman," who is the man stationed at the top of the shaft to "land" the men and coals, and superintend all that concerns the transmission of signals, of messages, and of live and dead stock, through the shaft. In a few minutes, things are prepared for the descent of this set of men, the ropes being held ready by the banksman.

At the bottom of each rope is a chain terminating in a hook, with a spring catch. The hewers and other workmen descend and ascend the pit (or "ride," as they say) in pairs by a "loop," made by hooking back this chain upon itself, the hook on its end being passed through a link. A pair of men insert each a leg in the loop, and laying hold of the chain or rope above it with one hand, are ready to counteract the effects of any oscillations by a stick in the other. In pits where both the ropes go in the same compartment, they are not allowed to descend in baskets at all. It is considered much safer to descend in the loops than the "corves" or coal-baskets; and it is only where the ropes are divided by a partition that the men are permitted to descend in the baskets. Where two ropes are in the same compartment of the shaft, a relaxation of the speed of passage is arranged at the "meetings," or point of conjunction of the ascending and descending load. To prevent the risk of being drawn over the pulleys above the pit's mouth, the attention of the banksman, who manages the engine, is arrested by the mechanically-contrived ringing of a bell at the approach of the load to the surface, and the winding-engine is duly stopped. Human beings ascending are, upon their arrival at the top of the shaft, grasped by the outstretched hand of the banksman, and pulled on to the "settle-board" or platform, and aided in disengaging themselves from the loop. A precautionary code of vocal signals is established between the "onsetter," or attendant at the bottom of the shaft, and the banksman at the top; and when the men manifest their intention to ascend, the onsetter, in addition to the transmission of such notice by a "token" deposited in the next ascending corf, makes that intention to resound through the shaft by vociferating to the banksman, "Ho! send away a loop;" and is responded to by the banksman.

It is indeed amusing, but sometimes painful, to witness the perfect nonchalance with which boys of twelve or fourteen years of age will catch the rope at the very moment of the commencement of its upward course, and cling to it by winding their legs and arms round it. When it is considered that they hang on in this uncertain mode for a passage of from 500 to 1000 and more feet, the sight becomes unpleasant to a stranger. It has been asserted that boys, after the close of a hard day's labour, have actually fallen asleep while "riding" in this way, and that the banksman has been compelled to grasp them with a somewhat rough hand, in order to secure and awaken them. This seems almost incredible, inasmuch as the act of falling asleep would tend to diminish the care of grasping the rope, and to relax the curvature of the limbs; but I was assured of its truth by two or three distinct parties who had witnessed such cases in former years, when the hours were much longer and the labour more severe.

The modern plan of drawing coals, and that most in use in the Wear collieries, is by square iron cages, sliding upon four "spears," or upright slides. These cages are divided into two or three compartments, into which the tubs of coal are conveyed. The tubs themselves, which I measured at Hetton Colliery pit, were of iron, 3 feet by 2 feet 6 inches, and 2 feet 6 inches in depth, holding 8 cwt. of coals, the tubs themselves weighing 3 cwt. The places of the tubs are occupied by men and boys in ascending and descending the shafts; and certainly this mode is more agreeable and more safe, and has in most instances the advantage of an overhead protection in the top of the cage. From two to six men can conveniently descend in this manner, and the chief cause for an accident would exist in one extending any part of his body beyond the cage, which indeed nothing but wilful carelessness could occasion.

Reader, I wish you to descend the shaft with me the next time. I will tell the banksman that we are going down in a "corf" or basket. The "loop" mode of descent is no pleasant thing; for, unless you can manage your stick well, you may get an unwelcome bang against the sides of the shaft, besides experiencing the sensation of amputation in your thigh, if you are at all tender-fleshed, from the cutting of the chain. But I do not wonder at your eyeing the ropes with an inquiring glance ere you trust your life to them. Well, then, those ropes are, as you see, flat, and composed of four strands, each four and a half inches in circumference, and the breadth of the four strands together is four and a half inches. These ropes are under the regular inspection of the banksman, but still it is as well to tell you that they *have* been known to break. However, the corf is here. Now, lay hold of the banksman's hand, step in, and grasp the chain above you with both hands. You hear (unless you are congenitally deaf) the banksman vociferate that long-winding "ho-o-o-oh!" Do not be alarmed. 'Tis true it is pitchy dark enough. Don't look up, or you will get your eyes filled with water droppings or dust. I am sorry you feel a degree of nausea; but it is not unusual in the first descent. You are unaccustomed to the rapid motion. Be composed; that was only the other corf that passed you. Now, then, do you hear the "onsetter?" Look down; we are slackening speed. See! there is the lamp at the bottom. Here we are at last. Give your hand to the onsetter; step out. Yes, I know you cannot see in the least degree. Give me your hand; mind that hole—that horse there—that "sump," or well, just before you. Sit down here a minute or two till the "under-viewer," or second mining superintendant, prepares all for us. I think you had better carry a candle, a Davy lamp gives but a feeble light; here is your candle stuck in clay. Put the clay between your third and fourth fingers in your left hand, and handle your stick gropingly in your right. Now, you can see pretty well. The under-viewer walks first, I go second; follow me. Now, we are proceeding up the "mainway," or, in fact, the high road of the pit. Right and left of us will presently appear passages at right angles to this mainway. You see that light in the distance? there is a load of coal-baskets approaching us. Do you hear the boy who drives the horses whistling? Here he is; stand close up on one side. There; he passes you safely with his twelve corves of coals. Follow on; stop, this is a door, called a trap-door; the little boy behind it will open it for you. This door is one of many placed in various parts of the mine for directing the ventilating current of air, about which more shall be said anon. Yes, the boy is very little; probably, he is only nine or ten years old. We will speak about these boys at large presently. Ah! your candle is out! Do you hear the under-viewer say to the pitman "gi'e us a low?" This is pit language for "Give me a light."

You have burnt your fingers; it is common with strangers. It requires some practice to carry a pit-candle (of which there are forty to the pound) without such misadventures. You find it very hot; I suppose you think you are too thickly sweltered up in flannels; no such thing. You will be in draughts of "return air" by and by, and will then feel it cold enough. That is a crane for hoisting the baskets or corves of coals upon the waggons that have passed you. Now, turn here to the right. You have now left the mainway, or "winning headway," and have turned up a "board" or passage, at right angles to the high road you have come from. At the top of this board we shall meet with the hewers at work. There! you see their lights glimmering? Push on. You are tired? Well, I do not wonder at it, for I suppose we have not walked already less than three hard and weary miles. This is an old pit, and consequently the workings are progressively more distant from the shaft every year. There! these black fellows are the hewers; they will most assuredly mulct you in half a crown for your temerity in coming here. "Pay your footing" at once gallantly. Now, then, we shall be permitted with good-will to investigate most scientifically all the mysteries of coal-hewing.

The modes of excavation must necessarily differ in accordance with the nature of the seam of coal. "All is not gold that glitters," and all is not coal that looks black. There is much "band," "swad," and "foul coal," in most seams. The nature and thickness of the interstratifications and other similar circumstances, decide the plan of hewing; the object, of course, being to send to bank the greatest quantity of marketable coals with the least expenditure of labour and time. The plan of working is fixed by the viewer, and he imposes certain restrictions and fines (by a bond) for such hewing as may be agreed upon as unfair or wasteful—restrictions that are the subject of not a few disputes between the men and the viewer, at some of which I have been present, and in which the spokesmen of the pitmen manifest no small amount of adroitness and ingenuity in putting the strongest case for their side. Whatever be their acknowledged deficiencies in other respects, there is no viewer who will not give them credit for quite sufficient astuteness to detect any imposition upon their rights of labour. The consequence of a viewer's persisting in a very obnoxious point may be an incipient local strike; the result of the adherence of the whole body of viewers in resisting the claim may be a general district rebellion.

In the ordinary mode of hewing the coal, the hewer curves out about a foot or eighteen inches of the bottom of the seam, to the distance, perhaps, of three feet, and then "nicks" up, that is, cuts in with his pick one of the nooks or corners of his board. By these means he has gained what he calls his "judd" or "vantage." This "judd" is either brought down by the insertion of wedges or the blast of gunpowder, in which latter case he drills a hole in the opposite corner, fills it with gunpowder, lights the match, and retires till the coal is torn down by the explosion. An able-bodied hewer can hew about six tons of coal in a day. In this mode the hewers proceed in excavating the coal, keeping the "boards" or passages about twelve feet wide. This one we are in you will find to be about that width. You observe that there are but two hewers at work at one time here. Some boards are made wider, to hold three or four together. This board will be driven through the coal until it has advanced about twenty yards, when "walls" or other passages are excavated at right angles to them. If you consider for a moment, you will see that, by continually driving these boards, such as we are now in, six yards apart from each other, and nearly parallel to each other, and then crossing them at every twenty yards by other passages, such a system of working will ultimately develop a large piece of panel work, the masses of coal between the boards forming "pillars" of the dimensions of six by twenty yards. These pillars are aptly so denominated, as they are, in fact, the supports of the mine. Formerly, the pillars were left in undisturbed possession of their loads; and when the coal was, with their exception, all excavated, the mine was abandoned. This was deemed necessary, chiefly from considerations of inefficient ventilation, of which we shall shortly speak at large; but of late years, the introduction of the Davy-lamp, and improvements of various kinds, have enabled the miners to obtain nearly the whole of the coal. Some collieries, actually abandoned prior to the employment of the Davy-lamps, have been re-opened, and the pillars worked nearly out. The pillars are worked either by longitudinal or lateral excavations, numerous props of wood being introduced to uphold the roof during the progress of this duty. When the pillars are removed as far as is practicable, these props are "drawn" or knocked down by men, who speedily retreat as each falls—an operation which, when I witnessed it, I was led to deem the most hazardous in the pit, as the withdrawal of each prop was not unfrequently followed by the fall of large masses of stone in alarming proximity to ourselves—a proximity the more alarming, when one became aware of the number of accidents that occur from such falls in the performance of this dangerous proceeding.

When, then, the roof has thus fallen in, that portion of the pit is denominated "goaf," and sometimes "thurst." This goaf, in highly gaseous seams, will not unfrequently become a natural gasometer; and from five acres of it, in one of the pits at Wallsend colliery, a discharge takes place, through a four-inch metallic pipe, of two cubic feet of gas per second. The pipe is carried up as high as the head gear above the shaft; and from its orifice issues, with a roaring sound, the stream of gas, which, having been ignited, forms a flag of flame seven or eight feet in length, conspicuous by day, and at night illuminating the entire neighbourhood.

When the coals are hewn or excavated, in come a class of able-bodied lads called "putters." These lads are divided into three distinct classes, according to their strength. They all fill the corves or coal-baskets with the coals, and then "put," that is, push or drag them to the cranes. The full corf is placed upon a "tram," or little iron-wheeled carriage about three feet ten inches long, and the tram upon the tramway that conveys to the crane. The strongest putter, called a "headsman," has a little boy as his assistant, denominated a "foal." The latter draws the corf with a pair of cords on level or uphill ground, and pushes against it with his back on declivities; and thus, for a distance of from sixty to a hundred-and-sixty yards, the coal is pushed to the spot where it is to be lifted.

You must now exchange your candle for a "Davy," as the naked light is unsafe in these parts, and walk this way to see the working of the pillars; but you must crawl, for you are too tall for these passages, which do not inconvenience the short colliers to any serious degree. Now, we are at the pillar-workings. I perceive you perspire most abundantly; so, indeed, do I. This is a most suffocating atmosphere. You have merely an ocular confirmation of the correctness of the above description of the mode of excavating the pillars. Well, then, we will return. Now, you are again able to stand nearly erect. You may notice, in the course of your return, the frequent appearance of numerous peculiar semicircularly concentric masses at the sides of the passages. These are called, technically, "metal rigs." They are portions of the floor of the mine, forced up by the enormous pressure of superincumbent matter. These "metal rigs" or "creeps" may be often observed in incipient development, and in all the stages of commencing and perfect creep. The perfect creep is that state in which the pressure has been sufficient actually to force up the floor against the roof of the mine. In such cases, a passage must be cut through at a great expense, if the spot is one necessary to be opened for the transit of coal. This creep goes on rapidly in the "waste" or deserted pillar-workings, and where the props have been drawn. When the process is very active, loud noises have been heard, resulting from the bursting up of the strata, and thundering like the discharge of artillery, or as if some of the revengeful spirits of the mine were making tremendous havoc in their intestine wars. In one very old pit, in the parish of Long Benton, I was told that several years since a sudden creep of so extensive a nature took place, nearly under the parish church, that the whole edifice was shaken, and portions of the ceiling dislodged, gaps or sinkings being visible in the neighbouring grounds. You feel it cool enough now? we are in the "return air," and shall very soon be at the shaft. Here we are again. Step into the corf; grasp the chain. "Ho-o-o-oh!" drawls the onsetter; the banksman re-echoes the same. We are off! You see the light now a little—now more; and now we are "at bank" again! Be cautious; give your hand to the banksman; jump out—all right! We will go to the viewer's house, wash, and change, and I will then describe to you as much about colliery ventilation as may instruct and amuse you.

THE EXCHANGE.

A STORY.

FROM THE FRENCH.

THE chronicles of by-past days inform us that a poor rascal, out at elbows, and with coinless pockets, was one day walking in a very pensive mood near the Champs-Elysées of Paris, half uncertain whether it would not be his best plan to betake himself to the real Elysian fields without delay, when he was accosted by a gentleman richly attired, who abruptly proposed to change suits with him. The melancholy stroller at first deemed this one of the jokes which people with holes in their coats must sometimes endure at the hands of their more fortunate fellow-mortals; but the proposer of the exchange soon showed himself perfectly serious, by commencing to strip with great alacrity. A dress, rich in excess, and magnificently embroidered, with a hat gallantly winged with feathers, being very much to be preferred to the looped and windowed raggedness characterising his own attire, the penniless muser began to uncase likewise, and in a few minutes the exchange was regularly completed; after which, the seeming loser by the bargain took himself off instantly. The new-born dandy or grandee, however, had scarcely time to felicitate himself on his good fortune, when he was seized by a body of the police, and hurried off to durance vile. It now turned out that the gentleman who had so readily parted with his rich clothes had strong reasons for so doing, being, indeed, no other than the famous robber Cartouche, then hard pressed by the myrmidons of justice.

Ludovic Demarny, a young man whom we now beg to introduce to our readers, might have no suspicion of being the subject of a ruse similar to that of Cartouche, and indeed could not have any good grounds for such a suspicion, when his cousin, Armand Demarny, came to him one morning, and proposed not only to change dresses, but to change stations in the world with his relative. This proposition was truly somewhat surprising, all circumstances considered. The two cousins were of provincial origin, had been friends from boyhood, and, left in youth without much means, had both come to Paris to push their way in the busy world. They had then been separated in a great measure by differences in tastes and habits. Ludovic had a strong tendency to poetry, and had become a litterateur, dwelling in obscurity and poverty, yet enjoying tranquillity in the dream-land of imagination. Armand, on the contrary, though not possessed of greater personal advantages than his cousin, had found his way into the brilliant circles of fashion; and having no means of his own to maintain his position there, followed the not uncommon plan of using the means of others for that purpose. In short, he lived upon credit, becoming a willing debtor to all tradesmen and money-lenders who, dazzled by his elegant aspect, residence, equipage, and companions, were imprudent enough to yield to his assaults on their purses.

On the morning on which Armand called on his cousin Ludovic, as already mentioned, the poetical dreamer was in a state of despondency not unusual with those pursuing a precarious literary existence. Wearied out by continual drafts upon his brain, some of them not very productive, he felt in a mood to desert the muse altogether, and resign the hopes of fame and wealth with which she had so long flattered him. "Ah!" said he, as Armand entered his humble apartment, "you are a happy fellow! You have addressed yourself not to the illusions, but to the realities of life. You have given to your young years their true employment." "Yes, I am happy, perfectly happy," answered Armand; "but wherefore cannot you be so as well as I? If you have hitherto gone astray in pursuit of chimeras, keeping yourself in obscure penury, it is not yet too late to strike into a better path. You have but to follow me, and I will show to you the route, strewn with gaieties and delights." The young fashionable then drew a brilliant picture of his ordinary routine of existence, expatiating with tempting unction on the pleasures of the opera, on his blood-horses and dashing barouche, on his little suppers, and all the other sources of amusement open to the man of fashion.

"But how do you manage to have all these pleasures at command, scant of money as you are?" asked the studious cousin. "By means of credit," said the other coolly; "I run in debt." Armand then laid bare to his cousin all the arts of a needy man of fashion, throwing over the subject such a glare and glitter, that it seemed as if the system of tricking creditors formed a source of perpetual amusement to him, rather than an obstacle in his path. "Are you astonished at all this?" said the dandy at the close of his revelations "how deplorably ignorant you are of life! You are writing a comedy, you say; by what means will you ever be enabled to paint the real manners of society? You live like a hermit, when you ought to be in the midst of the bustle of life, picking up such information and experience as may, when you retreat once more to your study, enable you to command that literary success which you now long for in vain."

The student was completely taken with the artful pictures and specious reasoning of his cousin. "You are in the right," cried he to Armand; "you have pointed out the only certain road to fame and fortune." "Well," said Armand, "since you seem satisfied of this, I will show you that I am not one of those who content themselves with giving counsel to a friend, leaving him to find out for himself the means of following it. I will remove all difficulties from your way at once. Take my place in society; take my chambers, my dresses, my horses—every thing, in short, which I possess. My debts you cannot be compelled to pay. In your new position you may study men and manners with every advantage; and when you are satisfied, say so, and quit the busy world at once. As for me, though unsated with the delights of society, I have fatigued my system somewhat, and my physicians order quiet and repose. I shall take your place in these apartments, and assume your lonely habits. What say you?"

The prospect of the proposed change was too tempting not to gratify the peaceful and well-disposed Ludovic Demarny; and in a short time he was installed in his cousin's well-furnished apartments, with the portals of society opened to him by numerous introductions. Young and enthusiastic, he enjoyed in a high degree the alteration in his course of life. All was new to him, and he feasted eyes and ears on a banquet of luscious sweets. On the other hand, Armand Demarny assumed not less readily the new part laid out for him. And now it is necessary that we should give a hint of his Cartouche-like purpose in proposing this scheme of metamorphosis to his innocent and unconscious cousin Ludovic.

At Havre-de-Grace, as Armand had learned just before visiting Ludovic, a vessel was expected immediately to land, bringing across the Atlantic a certain elderly gentleman named M. Rollandeau, and his young and lovely daughter Eugenie. Now, M. Rollandeau was the uncle of the cousins Demarny, and was possessed of great wealth, which he had made up his mind to bestow, along with the hand of his daughter, upon whichever of the cousins seemed most worthy of the honour. The artful Armand had not only learned these circumstances, but had also ascertained so much of the character of the merchant, as to adopt the impression that the studious and quiet cousin would be far more likely to please the prudent and monied merchant than the fashionable and extravagant man of the world. Hence the proposal for exchanging characters with the really quiet student.

M. Rollandeau arrived in due time in Paris, and his first visit was one paid to the now fashionable Ludovic, under pretence of purchasing one of his horses. When shown in, the old merchant found the young man reclining, in an elegant morning dress, on a magnificent ottoman, with a long Turkish pipe at his lips. "Sell to you that splendid horse!" cried Ludovic, when the fictitious proposal was made to him, "my good old soul, don't think of it. Sell that unmatchable creature which won the last race at Chambery! I should not take treble what you offer. So good morning; excuse me; I must go and prepare for the steeple-chase at Bery." With these words the newborn dandy bowed out his visiter with great nonchalance. The uncle shook his head, as he noticed two or three discontented-looking persons waiting the outcoming of the young dandy. They were evidently creditors, and the old man knew not for whom they really waited. To that artful gentleman M. Rollandeau next betook himself, and found Armand in perfect readiness for the visit. The chamber in which he sat was a peaceful and modest one on the third floor. The pen was in the hand of the occupant, and books lay thickly strewn around him. Very different was the look of the place from the extravagant glitter that surrounded Ludovic, and here no angry creditors frowned around the approach. M. Rollandeau, according to his plan, introduced himself as a man of business. "I have been informed, sir, that, though a young gentleman of some expectations, you are in want of money. I can command, should we form a proper arrangement, a sum of ten thousand francs." Armand could not help pricking up his ears at this announcement, but he repressed the longings of old habits, and answered meekly, "Ah, sir, you are doubtless labouring under a mistake. Since lending money is your business, you must have been directed to Ludovic Demarny, and not to Armand. We are cousins, but have nothing else in common but the name. Yes, sir, you have been misinformed. Armand Demarny is philosopher enough to be contented with little, and has nothing to do with money-changers; but go to Ludovic, and the man of fashion will be

delighted to see you, and will doubtless soon treat with you."

When the prudent merchant had concluded his first visits to the two cousins, it may be supposed that poor Ludovic, when weighed in the scales with his cousin Armand, was found wanting. But M. Rollandeau was resolved not to peril his girl's happiness lightly. And, besides, Eugenie had a mind of her own, and was not disposed to give away her hand to any one without previously obtaining some knowledge of the party. Her father found it comparatively easy to gratify her wishes with respect to the accessible Ludovic, and even Armand was also seen by her. And now it was that fortune took the side of the simple Ludovic against his artful cousin, though the former laboured under the disadvantage of not knowing the parties with whom he had to deal. Armand, sustaining the part which he had at first assumed before her father, appeared to Eugenie almost repulsively cold and reserved. Esteem for his supposed learning was all that she could accord to him. For Ludovic, who had been really struck with her beauty on first beholding her, and who lost some of his fashionable affectation in the sincerity of the feeling, Eugenie felt a warmer sentiment. She was captivated, in truth, in no slight degree by his appearance, manners, and language.

The old merchant, who watched all these things with an attentive eye, at last made up his mind, and sent for the two cousins. His disclosure of himself startled both in seeming, but Ludovic only in reality. Yet Armand was, ere long, startled too. "I have long resolved," said M. Rollandeau, "to make one of you my son-in-law. You, Armand, are a studious and peaceable young man. You live economically, and know not the want of money. That is all well; but you know the world only by books. Becoming possessed of fortune, and having not the guidance of experience, you would probably fall a victim to the artful around you, or would run the risk of losing self-restraint, and then what would become of poor Eugenie? You, on the contrary, Ludovic, have had an insight into the ways of the world, its perils and its follies. The frivolities in which alone you seem to indulge I do not account as vices. You must have gained experience. The means of living in elegance you will possess, should you become the husband of Eugenie; and if you promise to be to her a faithful guardian when I am gone, I here make choice of you as her husband." Need we say that Ludovic hastened rapturously to give the pledge which was required of him?

What were the feelings of the defeated imitator of Cartouche during the delivery of this decision? They were most galling; yet what remedy could he adopt? To announce that he himself, and not Ludovic, was the experienced man of the world, would have been to expose his trickery, and to enrage the uncle at the attempted deception. Armand was compelled to bear his mortification in silence; and who will not admit that he met a deserved fate, in having his artifice thus made the means of ruining his own prospects?

"THE GABERLUNZIE'S WALLET."

THREE or four additional numbers of this monthly publication have made their appearance, since, with the two earliest in the series before us, we spoke of it as a clever and original work, containing faithful though homely sketches of rural and humble life in Scotland, referring to past and present times.* The author appears to possess a keen perception of the feelings and modes of expression of that little regarded class of society whom he depicts; and he has certainly the merit—a rare thing among modern versifiers—of being no imitator of the style and thoughts of predecessors who have won the world's applause. There is, for example, no small degree of imaginativeness and feeling in the following verses, taken at random from the melange of prose and poetry in the late numbers:—

THE FIRST GREY HAIR.

"The wife wha sits on her ain man's knee,
An' keeks in his face wi' her slee black ee;
Losh, how the body will wauken an' stare
Gin she see in his pow the first grey hair!

Ere the leaves o' the forest hae wither'd or dow'd,
When the fields are a' wimpling an' waving in gowd;
Losh, how the farmer will shiver an' shake
Gin he see at his feet the first snaw-flake!

When the Winter hath past, and the bonnie young buds
Wad fain deck in green a' the auld black wuds;
Losh, how the wee things will wither an' dee
Gin the bark fa' awa frae their parent tree!

When fortune is smiling, and friendship is kind,
An' your wife an' your weanies are just to your mind;
Ah! how you feel gin death mak his first ca',
An' taks e'en your youngest bit tottum awa!

When we keep close thegither, e'en auld age grows strang,
Auld folks an' auld houses will stand twice as lang;
But ah! gin ane totter, or ane slip awa,
How the lave o' their cronies will totter and fa'.

Yet we canna weel grieve though they a' fade away,
Though aye now and then we see marks o' decay;
On the earth we can only but stay for a wee;
But in Heaven there is naething can wither or dee."

* Menzies, Edinburgh; Tilt and Bogue, London.

The author of the Wallet occasionally goes beyond the satirical, and presents us with a piece of cynical philosophy. From a lengthened poem in this vein, the subjoined verses may be given, chiefly to indicate, in justice to the writer, the varied character of the materials which he presents to his readers.

THE BEST O' FOLK ARE NEVER MISS'D.

"Wherefore should man, though e'er so great
In art or science, rank or state,
Think muckle o' himsell,
When he such humbling truths may read
From the mute mansions o' the dead?
Hark, how the echoes swell!
When man is laid in death's cauld kist;
E'en let him gang; he's never miss'd.

Yet still he strives, and strives in vain,
The top of Fame's high mount to gain,
An' mak himsell immortal;
Vain thought! whene'er life's taper's out,
The strongest, sternest loon maun lout,
An' pass thro' death's dark portal,
An' there maun lie an' tak his rest;
The lave live on; he's never miss'd.

See the young man lay in the grave
His new wed wife he'd died to save
Frae death's untimely blow,
He thinks his crape-clad neighbours round,
Wha whisper in a smother'd sound,
Are wailing o'er his woe;
While they are tittering at some jest,
And his dear wife is never miss'd."

And so on. But we greatly prefer our author in his more kindly humour. It sits naturally upon him, and speaks of a heart warm with love for his fellow-creatures. For instance, what can be more pleasing than the following little song upon

THE GREY HILL PLAID.

"Tho' cauld and drear's our muirland hame
Amang the wreaths o' snaw,
Yet love here lowes wi' purer flame
Than lights the lordly ha';
For ilka shepherd's chequer'd plaid
Has room enough for twa,
And coshly shields his mountain maid
Frae a' the blasts that blaw.
Then hey the plaid! the grey hill plaid,
That haps the hearts sae true;
Dear, dear, to every mountain maid
Are plaid and bonnet blue.

What tho' we're few upon the muir,
We lo'e each other mair,
And to the weary wanderin' puir
We've comfort aye to spare.
The heart that feels for ither's woes
Can ne'er keep love awa;
And twa young hearts, when beating close,
Can never lang be twa.
Then hey the plaid! the grey hill plaid,
That haps the hearts sae true;
Dear, dear, to every mountain maid
Are plaid and bonnet blue."

A single sample of the finer prose passages may be quoted.

MUSIC.

"All nature acknowledges the influence of music; man bends before its power; and even the inferior animals own its dominion. The deep-toned organ, as it peals through the groined and richly-fretted arches of the lofty cathedral, wafts the soul to heaven on the wings of melody, and elevates the devotional feeling of the sincere worshipper. The clear tinkle of the solitary church-bell in the Sabbath morn, as it echoes among the hills, is felt and responded to by the well-attuned hearts of those who, impressed with its old and sacred associations, repair, at its summons, from their distant homes, to hold sweet converse with their God, in the same church where their forefathers often had met together in the olden time. The sad sound of the pibroch deepens the gloom of the Highland glen. The muffled drum hushes to stillness the noisy voice of the crowded street through which passes the funeral procession of the poor soldier. The blind vocalist, whose voice awakens the dull and silent lane at nightfall, like a spirit wailing among the habitations of the dead, leads after him, in the cold winter time, groups of merry little creatures, who, chained by the ear, follow him through half the town, regardless of the punishment that awaits them on their return home from their nocturnal perambulations. The child, as he lisps and prattles on his nurse's knee, leaps bounding to a lively air, or is hushed asleep by a gentle lullaby. Old frail wrecks of humanity, whose dancing days have long since passed away, will beat time with their staff to the sound of the fiddle. Nations have been conquered, battles have been won, by the influence of music; and many a wounded soldier has shed his last sigh, and fallen asleep in the arms of death, amid dreams of home and friends conjured up by a melody associated with

'Life's morning march, when his bosom was young.'"

Feeling assured that Scotsmen resident in England will be delighted with a periodical whose more prominent features are calculated to remind them so vividly of the "north countrie," we cordially recommend the "Gaberlunzie's Wallet" to their attention.

NOTES OF A RESIDENCE IN THE BUSH.

FIFTH ARTICLE. BY A LADY.

FARM NEAR MELBOURNE—CONCLUSION.

OUR unfortunate journey from the bush station was at length brought to a close. After remaining two days in Melbourne, to purchase provisions and some articles of furniture, we proceeded to the farm which we had reason to expect would be our future home. I liked its appearance very much; it was agricultural, with ten acres already in crop, and about thirty cleared. The soil was rich and productive, and immediately we got a garden fenced in, and soon had a supply of vegetables. To complete the establishment, we procured some cows from the station, these animals being reckoned my private property. The chief drawback to our comfort was the want of a house, and we were compelled to live in a tent till one could be prepared for our reception. I was assisted in the domestic arrangements by an aged but willing and active woman, whom we had engaged as servant. Our neighbours round called upon us; but all were men, and I saw no ladies while at the farm for a period of eight months.

All went on well with us till the month of February, when the heat became almost insupportable, the thermometer in our tent being at 110 degrees almost every day, and sometimes 120. It was like living in an oven. All around, the country was parched up to a degree which I am unable to describe. Every thing was as dry as tinder; and while in this state, some shepherds either heedlessly or maliciously set the grass on fire a few miles from our farm, and it came down upon us in a tremendous flame several miles in breadth. Long before I could see it from the tents, I heard the crackling and falling of trees. My husband was in town, also our ploughman with the dray; and we had only one man at the farm, as little work could be done at this season. This man told me he had seen the fire, and that it was coming down as fast as he could walk, and would be upon us in half an hour, when all our tents, &c., would be burned. For a moment I stood in despair, not knowing what to do. I then thought our only chance of safety would be to burn a circle round the tents. I sent the children to the next farm with old Mrs Douglas, our ploughman's wife. Nanny Douglas, a strong active girl, was with us; so we lighted a circle round the tent I occupied, which was the most valuable. We procured branches, and kept beating the flames, to keep them from burning more than a space several yards broad, that the flames might not pass over; but before we had finished the burning, Nanny, who was naturally anxious about her own property, began to burn round her own tent. The fire was too strong for her to keep it down alone, so I saw her tent catch fire at the back, while she was busy beating out the flames in front. I ran to help her to pull down the tent, which she and I did in a few minutes. The tent was nearly all burned, but nothing of consequence was lost inside. Nanny was in a sad state, knowing that her father had several pounds of gunpowder in a basket under his bed. In trying to save this tent, I nearly lost my own, which caught fire; but Nanny, with great activity, ran with a bucket of water she was carrying to throw on the burning tent we had pulled down. She threw it over the part that had caught fire, while I beat with my branch; and we had only a hole about three yards square burned in our tent, and part of our bed which was next that side. We had now got the circle burned, and sat down to rest and contemplate the mischief we had done. We soon found that our exertions might have been spared, for, by the intervention of our ploughed land and a bend in the creek, the fire was divided before it reached us, and went burning and crashing down on each side, several hundred yards from us. It was an awful sight, and I shall never forget it. As it unfortunately happened in the heat of the day, Nanny and I were quite knocked up, and we lay on the ground to rest outside the tent for nearly an hour. Mrs Douglas came home with the children, and began to arrange the beds, &c., in the third tent we had for cooking in.

One of our neighbours, who lived several miles from us, knowing the fire must be near our farm, and my husband not at home, kindly rode over to see if he could assist us. I was glad to see him, as I felt very anxious about my husband, not knowing what might befall him upon his return, as it was now near sun-down, and the fire very near the road he had to travel. Our kind neighbour offered to go to meet him if I could give him a horse, which we soon did, as I had had them tied in a safe place on the other side of the creek. He fortunately met the dray not very far from home, and pointed out a road by which they might still get home ere the fire reached it. Had they been ten minutes later, they could not have got home that night, the fire burned so fiercely, and the horses were afraid of it. My husband and the men sat up all night watching the fire in the woods, which, owing to the darkness, was a most splendid sight, looking like a large town highly illuminated. Next day the conflagration returned upon us in another direction; but we were better prepared for it, and it was kept back by beating it out with branches. All

the gentlemen and servants from our farm, and our neighbours, were employed nearly all day in beating it out, and it was again watched all night.

This fire did much damage to several farms in our neighbourhood, in burning down crops and fences; it burned for nearly a week, and keeping it down was very fatiguing work, owing to the extreme heat of the weather. But, fortunately for the country, we had some very heavy rain, otherwise I am sure we should have had no food left for our cattle, the pasture being nearly all burned. It was astonishing how soon the country looked green again. After two nights of heavy rain, the grass began to spring afresh.

This fire was our crowning misfortune; for though it did little damage to the property, it led to personal illness, against which it was not easy to bear up. I caught a violent cold from being overheated while putting out the fire round our tent; Nanny, also, was ill, and unable to do any work for three weeks. Notwithstanding all my care, I could not get rid of my complaint, as the rains had set in, and our tents, clothes, and beds, were constantly wet. To increase my distress, I was seized one night with asthma, which increased every day. In this exigency my husband had a temporary hut put up for me, which would keep out the wet. It was put up in a week; and although not quite dry, we were very glad to get into it. It was made of young trees or saplings, sunk about a foot in the ground, and nailed at the top to a frame of wood. The saplings were placed quite close, and the walls were then plastered outside and in with mud, and washed over with lime. The roof was of broad paling, and we were very comfortable. Our hut was twenty feet by twelve; but I had a division of canvass put up in the middle for a sick daughter of Mrs Douglas, who had come to try if country air would benefit her. After being three weeks with us, she was advised by our medical attendant to return to the town, where she died in a few days.

I was now very ill, and could not lie in bed with asthma and cough, and my husband was also suffering severely from the effects of cold. Things were now in such a state that it was found impossible to go on with the farm, which we therefore let; and my husband being so fortunate as to get an office under government, we removed to Melbourne. At first, we could not find a house in Melbourne except a new one, and we were afraid to live in it. We were obliged to go to an inn, intending to look about for another house, but I was laid up there for three weeks with a very severe attack, from which I was not expected to recover.

We were exceedingly anxious now to send the children home to my mother, as I was told if I had many such attacks I could not live. I felt this myself; but we could not make up our minds about parting with the children, although we knew that Port Philip was a sad place for children to be left without a mother to watch over them; but, as I got stronger, I could not bear the idea of parting with them, and determined to take great care of myself. We moved to our new house because we could not find another, but it was very damp. I had a threatening of my old complaint, and my husband insisted on my leaving it immediately. He found another very comfortable one, and I continued pretty well in it for two months. I had only a few slight illnesses; but I durst not go out if the weather was at all damp. I had great difficulty in getting a servant when we came to town; indeed, I was without one for some weeks. At last I got a little girl of twelve years of age, till I could hear of a woman-servant. This little girl would not come for less than seven shillings a-week, and instead of being any assistance to me, was a great plague. She was always leading the children into mischief; and whenever I wanted my servant to work, I had to go and bring her home from a game of romps with some neighbouring children. I sent her home at the end of the week with her seven shillings, well pleased to get quit of her; and that very day an Irishwoman came to the door, asking me if I required a servant. She had landed from an emigrant ship three days before. I was delighted to see her, and bade her come in and I would try her. She turned out an honest well-behaved girl, but very slow and very dirty; her wages were twenty pounds a-year. Several ships arrived soon after this with emigrants, and servants began to find great difficulty in getting situations; they were to be seen going about the streets inquiring of every one if they wanted servants. Of course the wages came quickly down; men were now to be hired for twenty and twenty-five pounds a-year, and women from twelve to fifteen. One man I knew, who a month before would not hire under seventy pounds, said he would now be glad of a situation at twenty-five, which he could not get. The servants seemed astonished at the sudden change of things, for which they were not at all prepared.

From compassion, we allowed a number of female emigrants to live in a detached kitchen we had, until they could find situations as servants. They had come lately from Scotland, had little or no money, and lodgings were very high in price. These girls had come out with most magnificent notions, and were sadly disappointed when they found that situations were so difficult to be procured. As is often the case, they out-stood their market; for a few days they were determined to take nothing less than twenty pounds; but I advised them to take at once any respectable situation that offered, and then look out for a better. They found they had to take my advice at last, and most of them hired for twelve and fifteen pounds. Settlers may now expect to get on better, as wages are more reasonable, and they will also be better served, and more independent of their servants. Provisions were still high, but much cheaper than last year, which had been a ruinous one for most of the settlers, who were now feeling the sad effects. Few could say they had not suffered; and of course the storekeepers and shopkeepers participated; but I do think that in this country there is a lightness in the air that prevents one feeling misfortunes so deeply as in England.

Most people like Port Philip after giving it a fair trial, as the delightful and healthful climate compensates for many disagreeables which one has not been accustomed to. The great thing is to get over the first feeling of surprise and disgust. Many find it impossible to do so, and return home to disgust others with their story; but I never yet met one who said, after being in the colony two years, that he would wish to leave it to return home, except for a visit. And this, certainly, notwithstanding what I suffered, is my own feeling towards the country.

To conclude these rough notes: I now commenced a school in Melbourne, and had great encouragement to go on with it, having been offered a number of boarders, indeed more than I could have taken charge of. After a short trial, I was unpleasingly reminded that my health was too uncertain to attempt carrying my plans into execution, otherwise all would have been well. Misfortunes did not fall singly. We had received at this time a severe and unexpected pecuniary disappointment from home, which, I am ashamed to say, notwithstanding the fine light air of Port Philip, made me very ill. My husband insisted on my going home to my mother with the children, until his affairs were arranged; and I may consider myself very happy in having such a home to go to. Had I not been leaving my husband behind me in bad health, I could almost have considered our misfortunes a blessing, as it gave me the unspeakable delight of again seeing my mother—a happiness I had for some time ceased to hope I should ever enjoy, and which had been my only serious regret after leaving home.

I left Melbourne on the 10th September 1841, with the intention of returning some time next year; but that must be determined by my health and other circumstances.

OCCASIONAL NOTES.

MALTREATMENT OF CALVES.

THE manner in which young calves are abused on their way to the shambles, has frequently been a subject of painful remark. The practice, as far as we have observed it for several years—we speak more particularly of Edinburgh—is to tie the animals across the top of carriers' carts. If the cart were sufficiently broad to allow the animal full space on which to recline, there could be nothing very objectionable; but such is seldom the case. In almost every instance the head hangs over the edge, with mouth and tongue dependant; and the efforts which the afflicted creatures make to keep their muzzle from being grazed by the constantly turning wheels, are the most distressing part of the spectacle. We should be sorry to accuse country carriers, who form a respectable and useful body of men, of any thing like wanton cruelty. They only follow a bad practice, to which long habit has accustomed them, and like many inconsiderate folk, perhaps think that there need be little ceremony with animals about to pass under the hands of the butcher. Heedlessness and ignorance, we believe, are more frequently the cause of the cruelties perpetrated on domestic animals, the calf in particular, than a positive spirit of mischief. Scott, in his "British Field-Sports," mentions an instance in point, which we shall relate:—

Captain B——, one very sultry day, overtook upon the Harrow road a butcher's boy on horseback, having a calf slung across the horse, its head hanging down in a most painful posture; and, in addition to that torture, the cord with which its head was fastened passed directly over one of its eyes, galling it most violently. The animal seemed in great agony, and bleated most piteously; whilst the boy rode on, whistling with the utmost unconcern, yet bearing in his countenance no indication of a cruel disposition. The captain remonstrating with him in favour of the poor calf, received for answer from the apparently astonished lad—"Why, sir, what does that signify? it is to die tomorrow or next day!" The gentleman then explained to the boy the nature of a common animal feeling between man and beast, and asked him seriously whether, if *he* was in the place of the calf, such suffering would not be terrible to him, even although condemned to die on the morrow. The boy, on this question, seemed under a sudden recollection, and affected by a new feeling. Captain B——, finding his medicine to the mind of the poor boy had begun to work, in order to assist the operation, put his hand in his pocket, and presented him with a shilling, saying gravely but kindly, "Remember me to the end of your days." The boy, with a peculiar and softened look of conviction, and his best bow, stammered out—"I will, sir," and immediately applied to a man on the road to assist him in placing his poor charge in the most comfortable state possible, to endure the remainder of his journey.

Nothing more, we presume, need be said of the agony which calves must necessarily suffer in travelling for hours together in carts with the head downwards. On whatever plea of convenience or economy, it should be instantly checked, and some more humane method of carting the animals to market adopted.

CIGARS.

The cigar nuisance has wonderfully abated within these few years; there is, to all appearance, not a tenth of the number of smokers there was some time ago, and those who continue the practice seem to belong to inferior stations. Imitation has knocked cigar-smoking on the head. Having descended to shop lads, and all sorts of apers of gentility, it has been abandoned, as a matter of course, by those of higher rank. From whatever cause, we are glad that this abomination is getting turned out of respectable society.

BIOGRAPHIC SKETCHES.

MADAME CAMPAN.

PERHAPS there never was any age so vicious that it did not produce estimable characters. French society, in the latter part of the last century, was remarkably corrupt, in the upper circles particularly; and the women did not, as a body, form an exception. But even in the centre of a system of profligacy—the court—there were isolated cases of a purity above all suspicion. The subject of this notice, Jeanne Louise Henriette Genet, was born in 1752, of a noble family. Her father, M. Genet, first secretary to the minister of foreign affairs in the court of Louis XV., was a man of talent and virtue, possessing and professing religious feelings, and holding himself clear of surrounding corruptions of every kind. Her mother was likewise a person of superior endowments. M. Genet superintended the education of his daughter, to whom he imparted views as to the nurture of youth much in advance of his age. Though reared in retirement, the fame of the extraordinary intelligence of Mademoiselle Genet did not fail to reach the court, and, while she was yet in her fifteenth year, she was offered the situation of *lectrice*, or reader, to Mesdames, the sisters of the reigning monarch (Louis XV). Her parents were unwilling that she should take this post, for they dreaded the difficulties and dangers attending it; but having many children, and inadequate means of providing for them, they at length allowed her—though not without first impressing her with many an earnest counsel and warning—to enter the service of the princesses.

Marie Antoinette, on being united, in 1770, to the dauphin, afterwards Louis XVI., was thrown much upon the uncongenial society of her husband's grand-aunts, for there was almost no other company to which she could with safety resort in such a scene of frivolity. Here the young dauphiness became acquainted with Mademoiselle Genet. Similarity of age, as well as of tastes and talents, made them almost immediately friends, as far as disparity of rank permitted. Not long after, the young lectrice was married to M. Campan, private secretary to the dauphiness, who gave her on this occasion a dowry of five hundred livres per annum, and constituted her her own first woman of the bed-chamber, allowing her at the same time to serve Mesdames as formerly. When the dauphiness became queen, Madame Campan, as first woman of her bedchamber, was a distinguished court figure. The former friendship still subsisted. Madame Campan, in her Memoirs, has given us a striking picture of the private life of her royal mistress, whom she has effectually cleared from many scandalous stories raised against her by her enemies. The elaborate and wearisome etiquette to which the royal family of France was subjected, has also met with a faithful chronicler in the subject of our notice. During the terrible scenes connected with the Revolution, Madame Campan remained constantly attached to her unfortunate mistress, as long as she was allowed to do so. During the awful night of the 10th of August (1792), when the populace attacked the Tuilleries, with the most deadly designs against the royal family and all connected with it, Madame Campan only escaped destruction by leaping from a high window and taking refuge in a cellar, where she lay some time concealed beneath a small vat.

During the miserable imprisonment of the royal family, Madame Campan thrice threw herself at the feet of the republican mayor, Petion, to petition for permission to attend the queen, although well knowing the danger to which she would subject herself by so doing. Her claim was each time rejected with insult. A report has been propagated that she was the person who betrayed the royal family at the period of its flight to Varennes; but there is not the least ground for this report, which must have been owing to royalist jealousy; for Madame Campan, though devotedly attached to Marie Antoinette, was somewhat of a liberal in her own sentiments, and her nearest relations were rather conspicuous on the same side. During the reign of extreme Jacobinism, she had the honour of being denounced by Robespierre, and she was eagerly sought after by his myrmidons; but she was fortunate enough to avoid falling into their hands. A month after the fall of that wretched man, she found herself possessed of an assignat for five hundred francs,

the value of which, in the best days of republican credit, was only twenty pounds: with this she was called upon to provide for herself, a dying husband, a son nine years old, an infirm and aged mother, and some other members of her ruined family. At the same time, she was under obligations for her husband's debts. An ordinary spirit would have quailed under such circumstances, but that of Madame Campan proved equal to the difficulty. Since her early days, when studying under her excellent father, she had given much of her thoughts to education, for the business of which she seemed to have a natural aptitude. This suggested to her the honourable expedient of setting up a boarding-school, or *pension*, for young ladies. She chose St Germains, near Paris, as a situation at once suitable for the purpose and agreeable to herself; and, to give a guarantee of her religious principles, she took with her a nun of *L'Enfant Jesus*. Unable, from her slender funds, to have a prospectus printed, she wrote out with her own hand a hundred copies, which she sent to those friends who had survived the late commotions. She began with three pupils; at the year's end she had sixty; soon afterwards a hundred. She then bought furniture; and discharged her debts. Her excellent personal character, the reputation of her system, and perhaps, in no small measure, that reluctant veneration which was paid even by republicans to the survivors of the old court, seem to have been the causes of her success.

A lady, who was brought up in Madame Campan's school, writes to us as follows:—"Her plan of instruction was formed on principles which had been suggested to a naturally vigorous and well-disposed mind, by a long course of reflection on the attributes of the female character, and the proper position and influence of woman in society. It embraced the inculcation of simple and sincere piety, of the purest and firmest morality, the beauty and importance of the performance of all domestic duties, with the observance of order, method, and punctuality, joined to a warm love of country, and a faithful and persevering devotion to all prescribed branches of acquirement. The sufferings experienced by herself and country during the Revolution gave a perceptible colour to her views; and it was obvious that she sought, as one leading object, to prepare her pupils to act with energy and fortitude in the event of their being exposed to such calamities as she herself and so many others had then experienced."

In her Memoirs, Madame Campan informs us, that not long after the opening of her school, a literary friend mentioned it to Madame de Beauharnois, then a leading person amongst the chiefs of the republic:—"She brought me her daughter Hortense, and her niece Emilie. Six months after, she came to inform me of *her marriage with a Corsican gentleman*, who had been brought up in the military school, and was then a general. I was requested to communicate this information to her daughter, who long lamented her mother's change of name." It appears that the young Mademoiselles de Beauharnois slept in the same room with Madame Campan's daughters, so that a considerable intimacy sprung up between them. When Bonaparte returned from his Italian campaign, he was pleased with the progress made by his step-daughter, and began to take notice of her instructress. Hortense became, in time, a queen, but did not on that account forget her old mistress. She was surprised, however, that Madame Campan never treated her with the deferential etiquette which was due to her royal station. When playfully remonstrated with on this point, Madame Campan as playfully excused herself, saying, that she feared she should never be able to bow the knee to one who had once been under her rod!

Madame Campan had intended her establishment as a private one; but it became in time so large, as to assume something like a public character. Our informant recollects when its four classes were under the care of a set of masters not less than thirty in number, while Madame's own eye was present every where. The masters and mistresses were all of them persons of the highest reputation in their various departments. At the annual examinations, prizes were bestowed for every kind of merit, from the first draughtswoman and the nicest observer of method and order, down to the *best maker of a shirt!* An inscription appeared on every prize, as well as upon the *table d'examen* itself, "LES TALENS SONT L'ORNAMENT DES RICHE, ET LA RICHESSE DU PAUVRE"—(literally, "Talents are the ornament of the rich, and the riches of the poor.") Madame had made up a kind of catalogue of the requisite points of female education: a copy of this was sent monthly to the parents or guardians of every young lady, carefully filled up by the superior's own hand, according to the literary progress and moral excellence of the pupil. A similar account of the individuals of each class was handed to her every week by the masters. While the professed religion of the establishment was Catholic, it contained pupils of almost every persuasion, and of every Christian country from Greece to Denmark—it may also be said, of almost every rank in society, or at least from the very highest to the inferior department of the middle class. Rank enjoyed no preference of any kind: goodness of disposition, and superior ability and application, were the only means of securing distinction. One feeling of enthusiastic veneration for Madame Campan herself ran through the whole establishment.

Bonaparte had a high sense of the merits of this excellent and useful woman. When rising into political distinction, he twice attended a representation of *Esther* at her school. During the consulate, he said to her one day, "If I ever make a republic of women, I shall name you first consul." On his attaining the imperial throne, Madame Campan supplied him with authentic particulars of the etiquette of the former court, on which to model his own. A few years afterwards, on reviving the establishment of St Cyr at Ecouen, he nominated Madame Campan to its head—a change of situation, but not of duties. This establishment was an asylum for the orphans and sisters of the soldiers of the legion of honour. It was conducted on precisely the same principles as the school at St Germains. One of Madame Campan's nieces had, meanwhile, married Marshal Ney; another was lady of honour to the queen of Holland. We cannot suppose her thus enjoying the patronage of the Bonapartes without having become attached to them; but this was a change of feeling general in France, and which was scarcely to be wondered at, when we consider how settled the new dynasty appeared at that time to be in the chair of St Louis. It is also to be remembered, that the attachment of this lady to the old royal family did not extend to their political principles. Madame Campan was a woman of honour, but not a political bigot. It is remarkable how well she estimated the faults as well as the merits of Napoleon. The following strikingly just and acute remarks upon him were made by her in conversation:—"Napoleon's genius elevated him, but his temper proved his ruin. A restless, ambitious, reserved, and hasty temper, united with imperial power, was naturally calculated to give offence to those who approached him. Human vanity is a delicate string, which should be touched with the greatest caution. Napoleon conceived that his vast power exempted him from the forms which engage the love of subjects, and call forth sentiments of attachment. He seemed to think that he was sufficient to himself, and the many imperfections which he observed in mankind rendered him somewhat misanthropic. This disposition caused him to feel the ingratitude of many persons, because he mortified their vanity; and the vanity of the great, when it is once wounded, never forgives. He knew how to govern his subjects and Europe, but he could never govern himself." After his dethronement by the allies in 1814, Madame Campan had the honour of receiving a visit from the Emperor Alexander, who, looking from the leads of her house to the scene of the battle of Paris, told her that his army had only powder for two hours when the French army retired. She appears to have been on good terms with the restored royal family, to whom she communicated a list of the contents of a pocket-book confided to her care by Louis XVI. Napoleon, on his return from Elba, found this list, and ordered it to be sent to the office of foreign affairs for preservation, as a valuable historical document. Amidst the hurry of the hundred days, he found time to visit his young ladies at Ecouen. They were so delighted to see him, that they crowded around him, endeavoured to touch his clothes, and broke into the most noisy expressions of joy. The governess wished to impose silence on them—"Let them alone," said he; "their gaiety annoys the head a little, but it does good to the heart."

With Napoleon fell this establishment. Madame Campan now retired to the bosom of a small circle of friends at Nantes, where she spent some years in quiet, but not in enjoyment. She had been attacked by cancer, and her name was brought before the public by a calumniator in a way which must have given her the greatest uneasiness. To crown her griefs, her only son, on whose education she had bestowed the utmost pains, was snatched from her. Her chief employment during these latter years was the composition of a work on education, which has been acknowledged to possess great merit. She had previously gone in part over the same ground in a series of "Letters to her Son." The "Memoirs of the Private Life of Marie Antoinette," the work which has rendered her name historical, was written during her residence at St Germains. It is acknowledged to have placed the history and character of the unfortunate queen in such a light, that the calumnies uttered against her during her life, and after her death, can never more be brought forward by any writer of credit.

Early in 1822, the disease under which Madame Campan laboured seemed to be making fatal progress. She resolved to submit to an operation, though at the risk of immediate death. Having first fulfilled all her religious observances, she went through this trial with a firmness astonishing to all who were present. Although it soon appeared that the worst results would follow, her fortitude and presence of mind never forsook her. During the few days which elapsed before her death, she conversed freely and cheerfully on miscellaneous subjects, and even exerted herself to maintain the spirits of her attendants. On the political prospects of France she thus spoke to her friend M. Maigne:—"I quit the scene of life after having witnessed many vicissitudes; and every thing seems to forbode that France will yet be exposed to violent convulsions. Tranquillity will not be established until sentiments of justice predominate, which they must ultimately do, for truth has asserted her rights. The light so much detested has penetrated everywhere. It is criminal to think on politics without having an eye to that public happiness on which private happiness depends. The governments of Europe are at present guided by ideas and prejudices which are below the level of the age; the carriage is driven along old tracks, and it will not go smoothly until it reaches level ground. Power should be centred only in the law; it is misplaced any where else: it has no other resting-place which sound reason can acknowledge. Those who think otherwise are blinded by the dust of old parchments. They seem to forget that ruling by ordinances is out of date. People want something more substantial; they will no longer submit to the caprice of a minister, without complaining. The time for that is gone by." The wisdom of these remarks might not be far to seek; but at that time ordinary minds were not apt to find it, and few of any kind could have expressed it so well.

On the morning of her decease (16th March, 1822), she had her will drawn up. When it came to be signed, her hand trembled, and she said with a smile, "It would be a pity to stop short on so pleasant a road." Although very weak, and forbidden to speak, she persisted in addressing her friends. One had retired to a little distance; she called to her in a tone of voice less gentle than usual. The lady quickly approached, when, feeling the fault of which she had been guilty, she said, "How imperatively one speaks when one has not time to be polite!" Soon after this, Madame Campan fell into a lethargy, in which she breathed her last without any apparent suffering.

GARSTON'S VISIT TO GREECE.

NOTWITHSTANDING the unsettled condition of the Greek government, and the semi-barbarous vices which taint the Greek character, there are not wanting grounds for a hope that the future progress of the country and its people will be upward. A fresh writer on Greece,* Mr Edgar Garston, encourages this hope by the very favourable views which he gives of the characters of many of its present leading men, and by the gay and lively scenes which he paints, indicating increasing quietude and comfort among the actors in them. We do not propose formally to review this production, which, to speak the truth, is of too slight a texture to bear such examination; but we shall make one or two brief extracts, from which our readers may judge for themselves.

Arriving at Athens in February 1840, after a lapse of fourteen years since a former visit, Mr Garston was agreeably surprised at the numerous evidences of an improved state of things. "Although what I had seen at Patras had in some measure prepared me for the change, the contrast which the present state of the Piræus presents with its appearance in 1826 did not fail to produce a lively impression upon me. When I was there at that time, a half-ruined monastery, and a few cottages and huts in an equally dilapidated state, were the only buildings which occupied the shores of the harbour; while in the harbour itself were anchored only a few caiques and mysticos. Now, besides a crowd of small craft and merchant vessels of other nations, are anchored in the harbour ships of war of almost every European power, and on its shores are ranges of handsome houses, and a town of no inconsiderable extent. Instead of the ruin and desolation, and almost solitude, which I left at that time, I have found a scene of activity and prosperity, and a numerous and busy population, mixed up with sailors of various nations. The lazaretto, the dogana, the cafés, the carriages drawn up at the landing-place, were all so inconsistent with my reminiscences of a spot where, as an invalid, I had with difficulty found a roof which could protect me from the rain, that for a moment I felt as if under the influence of a dream. I should, indeed, have accused him of dreaming who, fourteen years ago, would have told me that I should one day find myself at the Piræus bargaining in my best Romaic for a conveyance to Athens in a good britschka, or that I should be driven from the one place to the other by a coachman in full Albanian costume. Such was the case with me yester-evening; and I confess that it was no disagreeable contrast to be conveyed at a round pace, and along an excellent road, over the same ground which it then required some caution to traverse on horseback.

This *modern* mode of travelling permitted me to luxuriate in the beauty of the approach to Athens, which, to be appreciated, must be seen, and seen, too, at the hour when the Acropolis is gilded by the rays of the setting sun, and every outline of the rock, the walls, and the columns, is defined with the delicacy of an etching. When I first visited Athens, I acknowledged the approach to the city under such circumstances to be unrivalled in beauty and in splendour; but the scene of yester-evening seemed to me yet richer than the picture treasured up in my memory. As I called to mind that many an exile had wept as the same sacred columns receded from his view, I should have pronounced the tribute of tears to be justly paid to the beauty of the objects they were compelled to quit, independent of the associations which, at such a moment, patriotism and religion would summon before them.

The view I have of the modern city is most gratifying, as it extends in every direction over spacious and well-built mansions, indicating the presence of

* "Greece Revisited, and Sketches in Lower Egypt in 1840." By Edgar Garston, Knight of the R. M. Greek order of the Saviour.

wealth and tranquillity, where I last saw only misery and destitution, and ruins blackened by the outrages and vicissitudes of war. To complete the chapter of contrasts of yesterday, I accompanied some of my fellow-passengers to the opera, where I heard 'Lucia di Lammermoor' performed in a very respectable style. The king and queen were present, the former in an Albanian dress, which appeared to sit as easily upon him as if he had been bred a pallekar; the latter dressed with much simplicity in the fashion of Europe. Among the maids of honour, a fair daughter of the justly celebrated Marco Bozzaris was pre-eminent in beauty; but even she must yield the palm to her fairer sovereign."

The beauty of the queen of Greece is described as something superlative:—"First in beauty and in grace, as in rank, among the fair denizens of the saloon, was the queen; who, as she glided through the mazes of mazourka, waltz, and quadrille, was literally and deservedly the cynosure of every eye. Her countenance beams with kindness and good feeling; and altogether, she is a princess for whom, in days of yore, belted knights would right joyously have splintered their lances and jeopardised their limbs and their *hearts*. Wherever she addressed a passing remark, whether to young or old, a glow of gratification suffused the countenance of the favoured individual, evidently a tribute spontaneously offered rather to the graceful and lovely woman than to the sovereign.

My presentation to their majesties was rather a nervous affair for one all unused to courtly ceremonial. Owing to my late arrival in the rooms, I had to go through the ceremony unaccompanied, except by Sir Edmund Lyons, who did me the honour of being my godfather on the occasion. It took place in the centre of the saloon, during a pause between the dances, and I was thus necessarily converted into a target for the critical eyes of the surrounding circle. I thought, at the moment, that I should have preferred again taking my chance, in the same capacity, in a mountain onslaught. A most gracious reception on the part both of the king and of his fair princess speedily convinced me that the latter selection would have been an injudicious one, and rendered me proof against the 'artillery' by which I was, or imagined myself to be, surrounded.

During the short conversation with which I was honoured by the queen, she questioned me as to the changes which I had remarked at Athens, in such a manner as to give me to understand that the circumstances of my former residence in the country were not unknown to her. This I mention, not as a matter from which to draw any self-gratulation, but as an instance of tact in the exercise of the 'métier de prince;' for I believe it to be generally admitted that a sovereign ought, in order the more effectually to win 'golden opinions,' to show a degree of acquaintance with the history of every one by whom he is approached. When the sovereign is a beautiful woman, sentiments of grateful loyalty will be lavishly poured out in return for such semblance of personal interest; for the strongest of us are weak when our vanity is assailed by beauty alone, and still more so when that beauty is encircled by a royal diadem."

Another gay Athenian scene fell about the same time under our author's eye:—"The first day of the Greek Lent fell upon the 9th instant. It is not distinguished from the days which close the carnival otherwise than by a general abstinence from animal food, the maskers still retaining their carnival attire. It is somewhat curious for a Frank to see worn as masquerade dresses the every-day costume of his own country. Among the masks of this day, which in general were badly dressed and without meaning, I observed one group which was by no means deficient in character. It was composed of two individuals dressed as Europeans of fashion, attended by a third in the Turkish dress carrying an umbrella, camp-stool, &c., representing two European travellers and their dragoman. From time to time the Franks would make a halt, take out their portfolios, and be seemingly intently occupied in taking a sketch, or in drawing the portrait of some one whom they would stop for that purpose. Anon they would enter into conversation with another of the passers-by, through the medium of their attendant, as if themselves ignorant of the country, and affecting to be much struck with some remark or reply, would take out their note-books and set it down therein, with an air of infinite satisfaction. It was really a good practical satire upon the bearing of many European travellers.

About two, P.M., accompanied by my friend K——, I strolled out of the city in the direction of the temple of Jupiter Olympus, in the neighbourhood of which it is customary for the Athenians to congregate on this day, and to partake in public of their first Lenten meal. The spectacle which awaited us was of a most animated and interesting character, and distinguished by peculiarities which would in vain be sought for elsewhere than on Attic soil.

The day was brilliantly clear, and the greater part of the population of Athens had quitted the city, and was collected on the plain around the ruins of the temple, along the banks of the Ilissus, on the Eleusinium, and on the rocky sides of the hills which rise abruptly beyond the bed of the river. Several thousands of people, of both sexes, and of all ages, were thus assembled in a sort of natural amphitheatre of about a third of a mile in diameter. Some, like ourselves, were there merely as spectators; but by far the greater number were active partakers in the occupations of the day, which were by no means those of a day of fasting.

Here was to be seen a family group seated in a circle on the turf, tranquilly discussing their bread and olives, and washing down with wine their otherwise abstemious fare; there was a more numerous band already slightly exhilarated by the juice of the grape, linked hand in hand, and threading the mazes of the albanitika—their movements regulated by the simple notes of the mandolin, or not unfrequently by the cadences of their own voices; hard by, a party of a more grave character stood listening to the song or recitation of some Homer of modern times; on the outskirts of the assemblage were horsemen, both gentle and simple, in *point-de-vice* European uniform, and in flowing Albanian camise and capote, skirring across the plain in quest of admiration; bright eyes glancing from many of the groups, and bestowing the desired meed; and a general air of joyousness and contentment pervading alike actors and spectators. Such was the character of the scenes of animated life, with which the distant view of the Ægean and its isles, glowing in sunshine, but undimmed by the haze which accompanies intense heat, was in perfect harmony. Meanwhile, the monuments of the Athens of other ages—the silent Stadium—the stately and palm-like columns of the Olympium—the Acropolis, severe in beauty—were thrown into bolder relief by the contrast which their desolate aspect offered to the gay and brilliant groups which thronged in their vicinity.

The king and queen, with a brilliant suite of attendants, among whom was the lovely Mademoiselle Bozzaris, made their appearance on the ground in the course of the afternoon, and mingled with the crowd, so far as a band of equestrians might do so without danger to their neighbours."

With one of those anecdotes which have been mentioned as placing the present leading men of Greece in a pleasing light, we shall conclude. The Greek minister of Marine, named Kriezis, had been a prisoner at Algiers in 1811, along with his brother, also the holder of an important office:—"The two Kriezis were made captives, together with many others of their countrymen; and, at the commencement of their captivity, all were employed indiscriminately in the naval arsenal and in other public works, and were treated with much severity. The dey, however, having observed the deference with which the younger Kriezis was treated by his countrymen, and the influence which he exercised over them, relieved him from all manual labour, and appointed him superintendant over the works in which they were employed. The elder brother continued to be occupied at task-work as before; but his fate, as well as that of the other Hydriotes, was alleviated in no inconsiderable degree through the influence which the younger Kriezis had acquired with the dey. They had been in captivity about a year, when an order was received from Constantinople, enjoining the dey to release all the Hydriote captives. The dey partly complied with and partly evaded the order, by setting at liberty a limited number of them, among whom was the present minister of Marine. He, however, besought the dey to release, in his stead, his elder brother, who had a wife and family at Hydra, proposing to take upon himself his labours in the arsenal. The dey complied with his prayer, but did *not* liberate him in reward of so noble a sacrifice. He remained in slavery nearly three years longer, after which a further and more peremptory order from Constantinople caused him and the other Hydriotes to be set free without ransom. His family, in the interim, had sent to him, through a Jewish merchant at Algiers, the sum of fifteen hundred dollars, in order that he might negotiate his liberation. Instead of applying it to that purpose, he devoted the entire sum to the relief of his poorer countrymen and companions in captivity. Such actions need no comment; they deserve to be recorded in letters of gold, rather than in so humble a page as mine!"

IMPROVEMENT IN MAKING BUTTER.

At a late meeting of the Royal Agricultural Society of England, a Mr W. Were, who for thirty years has been engaged in the butter trade, communicated the following suggestions for improving the qualities of fresh and salt butter:—"Solidity and firmness are of more consequence than is generally allowed; the nearer the butter can be made of the consistency of wax, the longer it will keep its flavour; as it is not so easily acted upon by the air, it will retain less salt; and being divested more effectually of the buttermilk, will be less disposed to activity. To accomplish this, rather more fine table-salt should be put to the cream than is generally used after churning, because a part will be left with the buttermilk; or strong clean brine should be mixed with the cream or butter; the hand to be used in the making as little as possible (the earlier the butter is made, and the cooler the dairy, the better; the latter should be washed out with salt and water the first and last thing every day). The hand relaxes the texture of the butter; it might, by practice, be avoided altogether, by using wooden pats for putting it into casks or making it into shape for sale, which will press out the whey by beating. These pats must be always kept in a tub of fresh cold water, which will prevent the adhering of the butter, and keep them cool. The quantity of salt or brine required will in some degree depend on the season of the year, the distance to be sent, and time to be kept. Brine is preferable to salt, as the butter is smoother and better flavoured. If salt be used, it may be in the proportion of half an ounce, mixed with two drachms of fine saltpetre, and two drachms of fine yellow dry Jamaica sugar to every pound of butter. If the butter be made up in lumps for the market, every lump should be wrapped round with calico soaked in brine; if the latter be weak and watery, it may be injurious. If the butter be put into a firkin or half firkin, the cask should be made of white oak, ash, sycamore, or beech (the whiter the wood and hoops the better), well-seasoned by scalding out several times with hot brine. It should be made water-tight, with head and bottom grooved; three pounds should be allowed for sockage. If the butter is very choice, a salt cloth should be wrapped around it. This can be kept in its place by a hoop, which can be removed as the cask fills; in either case the cloths can be returned or sold. Many use cloth instead of paper in sending out their butter. Much observation, attention, and arrangement is required to see and judge what improvement can be effected in butter; comparative statements from different dairies at different times—the temperament of the milk and cream in the different stages—the situation and state of the dairy—the quantity and quality of cream in different localities, under different management—the effects of various sorts of salt, brine, sugar, honey, or saltpetre, mixed with the milk, the cream, or the butter—the effect of mixing different milks together—the effect of heat and acid applied in churning—the best sort of colouring—the effect of dry, wet, or shady pasture, also of regular exercise for the cows—if any; and what effect as to production of cream in proportion to the milk given by the cows, if feeding on corn or grain, or by adding meal in the water for drink." The wooden pats recommended by Mr Were to be used instead of the hands in making butter, consist of a thin spatula (a foot long by three inches broad) and a solid spoon-shaped implement (a few inches longer), with longitudinal grooves on its flat inner surface for dabbing, pressing, and crimping the butter. Mr Burke adverted to the importance of selection of the proper kind of salt adapted to each kind of butter and cheese, attributing the superiority of the Dutch to their care in this particular. He also stated that in many parts of Holland brine was added, not to the butter itself, but to the cream from which it was to be obtained; and that he believed honey to be preferable to sugar as an addition for improving its quality.

DR TURNBULL'S OPERATIONS ON THE EYE.

We have much pleasure in copying the following notice respecting Dr Turnbull's operations from the *Literary Gazette* for June 11, 1842, the name of whose editor is a sufficient guarantee for the accuracy of the statements. It would appear that the ingenious doctor is as successful in his operations on the eye as on the ear:—

"Three weeks ago, in a notice to correspondents, we mentioned that we had 'heard of Dr Turnbull's *cure of blindness by the fumes of prussic acid*, but had no personal knowledge of the process;' which notice immediately procured us an invitation from Dr Turnbull to witness the cases of several patients, from five or six to above twenty years of age, who were under his treatment for this sad calamity. We accordingly attended; and it is not easy to express our astonishment and gratification at what we saw. The various stages of cure, advanced in our presence, by the simple application, for about half a minute, or until a little warmth was felt by the patient, of the vapour of hydrocyanic acid in a small phial, held up to the eye, with an aperture fitting the form of that organ; the various nature of the diseases so assailed—opacities of the cornea, inflammation, cataract, amaurosis, iritis, &c., &c.; the various stages of relief which the patients had reached, with sometimes one eye opened to sight, and pleasurable to look upon, and the other left nearly blind and in its pristine deformity, to show what had been achieved; the various appearances of films removing, cataracts breaking up and being gradually re-absorbed, pupils being redeveloped, and other altogether extraordinary symptoms of remedy and regeneration, filled us, we repeat, with wonder and delight.

One child had been totally blind from six days old—had been taught to read on the raised letters by the system now introduced into schools for the blind; but it could now see these letters, and—it was a curious phenomenon to behold—could equally read them by touch and by sight! The only difference was a singular alteration in the tone of voice and pronunciation when reading in the two ways; that by the eye being far more natural, and like the usual reading to which we are accustomed, than the other, which was monotonous, and with an air of difficulty even amid the singular readiness acquired by this method.

Other cases there were of the wonderful production of the power of vision to those born blind; but we select the case of a girl 22 years of age, and therefore fully capable to comprehend and to answer any question put to her. In utter darkness for thirteen years previously to her coming under Dr Turnbull's treatment, she now can see her way, and can distinguish countenances and colours.

If possible, a more marked instance of the efficacy of the curative process was exhibited in a young man who had worked for many years at bookbinding. Inflammation, and subsequent *eminent* treatment, lancing, &c., had rendered him so totally blind, that for some time before, and during the first two or three attendances for the application of the prussic-acid vapour, he was obliged to be led. But he told us that now he could safely dispense with such aid, and readily discern objects. Soon, we have little doubt, he will be restored to his calling and to independence.

Another most interesting example of the value of this discovery was that of a gentleman from Canada. He had been afflicted in one eye with cataract and blindness for ten years. His remark to us was, that when he first came to England, he could not, with the diseased eye, distinguish a cow from a horse. Now he could mark and recognise countenances with it, and could appreciate the

visible distinctions of a sovereign and a shilling. This he did in our presence, but much more readily after the vapour of the highly concentrated acid had dilated the pupil, and, to a certain degree, even in the short space of time occupied by the action of the vapour, attenuated or dispersed the cloudy coats of the cataract.

Having witnessed and assured ourselves of the reality of these things, we sought the *rationale*, the source of the discovery, and the causes of the effects. Dr Turnbull's answer was, that the datum which had suggested the first experiments to him was the evidence afforded in all cases of death from poisoning with prussic acid; it was recorded, in every instance, that the eye of the corpse was observed for days as clear and lucid as if still in life. This led him to conceive that the acid exerted a specific action on the eye. He argued, that any medicament which produced such a symptom after disease must possess certain powers over the living subject; and he ventured upon his course of investigation accordingly. The principle was speedily developed. The eye and all around it soon dilated and reddened. It was evident that the red arterial blood rushed into the minutest fibres of the veins, and excited a strong action throughout the whole of the capillary processes. Not the slightest pain arose; a sedative influence appeared to be exercised on the nerves of sensation; and even if inflammation existed, it was rapidly removed. The eye, however, presented all the symptoms of violent inflammation, which is the truly natural curative process, yet without the suffering of the struggle between nature and disease. The humours became quickly and singularly active; by degrees the seat of the disease was assaulted, and a healthful tendency created, either to supply deficiencies or to remove obstructions. By repeating the applications, the cures were completed.

The first thought that suggested itself to us, having no near or dear relative so heavily afflicted, was the restoration to the blessings of the faculty of vision of an amiable and much beloved prince. Painful operations have been tried with little or no success. Here was, then, a treatment involving no suffering, entailing no distressing consequence, endangering no other faculty, but, to our conviction, insuring relief and restoration. 'Why not at once make known this discovery to the Prince of Hanover?' we exclaimed. In answer, we were pleased to be informed that on that very morning four gentlemen who had witnessed the treatment, had been, equally with us, delighted with the wonders of the hydrocyanic vapour; and with the hope of cure for the illustrious scion of our royal family, one of them, personally intimate with the king, had expressed his intention forthwith to communicate what he had observed to Prince George of Hanover.

On inquiry what the results might be on old or short sights, Dr Turnbull laughingly replied, that hydrocyanic acid would soon supersede spectacles; it so altered and helped the vision in either case, that no doubt could exist of its applicability to their relief and restoration. Be this as it may, we hesitate not strongly to recommend the wonderful discovery of the cure for blindness."

THE COMMUNITY OF SHAKERS.

MISDIRECTED religious sentiment has on few occasions taken a more extravagant form than in the case of the Shakers—a sect confined, as far as we are aware, to the United States of America. The following account of a community of this sect is from a manuscript volume submitted to us by a gentleman lately returned from America:—

"From Hudson we proceeded through a level but not well-cultivated country, the soil generally sandy and poor, to Stockbridge, and thence drove to the village belonging to the Shakers. They are a cleanly and industrious people, and were it not for their wild and peculiar tenets of religion, they might be held up as an example to others. Those who wish to become members of the society must deposit all they possess in the common purse, and then enter upon a kind of probation, before they are admitted. There are no drones among them; all must work for the good of the common stock; and the produce of their labour, having obtained a character, commands a higher price in the market than the general run of similar articles; so that they may be considered as a prosperous body. Their houses are large, kept clean to minuteness, and are comfortably furnished. From twenty to thirty dwell and mess together, the women and men in separate dwellings; nevertheless, the two sexes appear to be upon the most friendly footing with each other. It is a first principle of the Shakers that the sexes should live entirely apart, this being, as they think, necessary to righteousness. Hence, as a community, they must either recruit from the body of society at large, or become extinct. There are two stores in the village for the sale of the various products of their labour, such as baskets, stockings, shirtings, gloves, shoes, butter, cheese, hams, garden and vegetable seeds of all kinds, cabinet ware, worsted jackets, &c., all in exact order, and showing a neatness and arrangement that would shame a first-rate Bond Street milliner. Nothing could exceed the neatness and cleanliness of the dairy and milk-house; in fact, the floor was shining as bright as any dining table I ever saw, and even their workshops were all equally well regulated. Having accompanied the head of the Shakers through the whole of the establishment, we left the village, and went on to Lebanon.

On the following day, being Sunday, we retraced our steps, to see the worship of this singular people. We found the chapel a handsome large building, and equally clean with their dwelling-houses. There were two entrances to it: one for the females, the other for the men; the floors were bright, and shining like mirrors; the walls were painted bright green, and the roof white. There were about two hundred and thirty female Shakers present, and nearly the same number of males; they occupied forms facing each other, on opposite sides of the church. The former were all dressed alike, in white caps, shaped close to the head, covering most of the cheeks, coming all round close to the neck, and tied under the chin; also neckerchiefs, and light-brown stuff gowns up to the neck, made loose, something similar to a morning wrapper, which precluded the possibility of forming even an idea of their figure. The men wore long drab coats down to their heels, blue cloth waistcoats, and light-brown cloth trousers, high-heeled shoes, and red stockings. They had all a peculiar expression of countenance, and it seemed to me that the whole members of the society had the same formation of nose, like a triangle, but very small, and sharp at the end. The service commenced on a signal given by the head master, or trustee, on which they all rose, and piled the forms upon one another at their respective ends of the church. They then stood up, in open rows, of thirty each, leaving an open space between the sexes, but facing each other. They then, with uplifted hands, made three prostrations, and sang successively, with good effect, three hymns to as many lively airs. The superintendant then stepped forward, and addressed the visiters, of whom there were about three hundred present, requesting them to demean themselves properly while the members showed their gratitude, in gladness and singing of heart, for the unspeakable riches of salvation to a lost world. The men, then, with great coolness, took off their coats, and the whole faced to the east, keeping still the open space betwixt the men and the women; and while the whole body of the Shakers struck up a merry tune, somewhat like "Jenny Dang the Weaver," and sang a hymn, they danced away with all their might, retreating and advancing as if they were practising a fandango. This continued for half an hour, when they again turned and faced each other; they then sang another hymn to a lively tune, and afterwards remained silent for a few minutes, as if engaged in prayer. Ten men and ten women then stepped forward into the middle of the chapel, and formed themselves into a circle to act as a band; next to them, the more youthful Shakers formed two and two abreast; and next to them, the older ones formed five and five abreast, the men and the women still keeping themselves apart from each other. The band then struck up a merry tune, and the two outer circles danced round the band in opposite directions, making sad grimaces, tossing their heads, clapping their hands, and capering like so many maniacs, the perspiration pouring down their faces, which showed that the exercise they were indulging in was no joke. Upon a signal being given, they put on their coats, and formed into column, when they all knelt, and in that posture sang a hymn. After this, they arranged the forms, sung three additional hymns to merry dancing tunes, and thus ended the service—a service which can only impress the spectator with pity for the deluded mortals who practise it. This community of Shakers is rich, being possessed of about ten thousand acres of land, which may be worth five million dollars, besides other property, which may be worth as much more, so that, with frugality and industry, they may accumulate vast wealth; and as they are indefatigable in their exertions to procure proselytes to their religious opinions, they may, at some future period, have too great an influence over the minds of the poor and ignorant, and thus become an object of legislative interference.

Besides the Shakers we saw at the chapel, there are about eighty others, who have so far succeeded in overcoming the natural feelings, that they are considered by themselves, and by the members of the society, as perfect, and pure in mind and body, and that therefore they ought not to make any profession of their faith before men, but to confine it to the single eye of Him whom they worship alone in spirit and in truth. This class keep by themselves, and have great influence in the society; although many here assert that they are much greater rogues than saints—a point on which I do not feel qualified to give an opinion."

VESSELS OF THE UNITED KINGDOM.

A return has been laid before Parliament of the number of vessels above fifty tons burden, and the total amount of their tonnage registered at each of the ports of Great Britain and Ireland, including the Channel Islands. The three chief ports in England are London, Liverpool, and Newcastle; in Scotland, Glasgow (including Greenock and Port Glasgow), Aberdeen, and Dundee; in Ireland, Belfast, Cork, and Dublin. The returns for these places are as follow:—London, 5,405 vessels, 598,554 tons; Liverpool, 1,097 vessels, 307,852 tons; Newcastle, 1,143 vessels, 259,571 tons; Glasgow, 662 vessels, 187,545 tons; Aberdeen, 298 vessels, 52,443 tons; Dundee, 282 vessels, 50,060 tons; Belfast, 250 vessels, 44,458 tons; Cork, 221 vessels, 29,765 tons; Dublin, 134 vessels, 23,072 tons. Total for England, 10,804 vessels, 2,633,345 tons; Scotland, 2,261 vessels, 429,635 tons; Ireland, 1,037 vessels, 165,969 tons; and for the whole of the United Kingdom, including the Channel Islands, 14,416 vessels, and 2,668,732 tons.

[Here we have a fleet of nearly fifteen thousand merchant vessels; and adding to these the vessels of the royal navy, it may be doubted if all the other ships in the world are equal to them in number. The steam marine, alone, of Great Britain, has within these few years become a thing truly tremendous in amount and power.]

SAUCE PIQUANTE.

The late Michael Kelly, whose dinners and suppers were themes of admiration to those who were fortunate enough to enjoy his friendship, made no secret of the preparation of a sauce, the result of experience. I have often seen it in manuscript, long before the appropriately named Dr Kitchener wrote his "Oracle," and it is thus composed:—Put as many parsley leaves as will fill a table-spoon into a mortar, add a table-spoonful of capers, and pound these well together; then a table-spoonful of fresh mustard, and three hard yolks of eggs; pound away on these till they are properly mixed; wash, bone, and force through a sieve half a dozen anchovies; to this add a table-spoonful of vinegar, two of oil, a shalot chopped very fine; add these to the former ingredients; and when about to be used, stir them all into half a pint of melted butter or strong beef gravy.—*Epicure's Almanac.*

TO THE ABSENT SWALLOW.

BY THOMAS SMIBERT.

Where dost thou linger all this pleasant time,
Sweet bird, that wontest to forerun the May?
Above what scented grove of southern clime
Pursuest thou on earnest wing thy prey,
Feasting and sporting through the livelong day?
Or over what supremely favoured pool
Dost thou now nimbly fly,
Sending, in passing by,
One arrowy streak of night along the waters cool?

When infant day from off the glossy leaves
Sips nursing dew to nerve its manly noon,
I cannot hear thy twitter in the eaves,
Though longing, sleepless, for the tuneful boon;
Nor have I yet beheld thee, late or soon,
Darting with levin-speed athwart my view,
Eager in quest of food,
Or, for thy annual brood,
Toiling to prop some ancient home, or build a new.

Haply thou dalliest, my gentle bird,
Betwixt our chill climes and the southlands warm,
Loth to advance, because thine ear hath heard
The snorting of the war-horse of the storm?
Shall wintry blasts our summer fields deform?
And hath, indeed, thy keen instinctive sense
Forewarned thee to remain
Where mild airs daily reign,
And night, for all her damps, can do thee no offence?

Yet come, and fear not, cleaver of the skies!
Things frail as thou art here, and know no blight.
Ever at night-shut doth the lark arise,
A darkling star, to spot the arch of light,
And pour his notes, cascade-like, from the height;
And even the callow youngling of the wren
Boldly erects its crest
From out the parent nest,
Nor fears, beneath the leaves, or cold, or wind, or rain.

Step we abroad to breathe the fragrant air,
And, blended with the tints on mount and lea,
Our charmed eyes shall notice, everywhere,
The golden kirtle of the forest bee;
And we shall hear him humming joyously;
And mark, besides, safe-swinging in the breeze,
And gleaming to the sun,
The spider's cordage, spun
Between the sheltering branches of the full-leaved trees.

Nay, weaker things by far than these can dwell
Securely where thou shrinkest to appear.
Within the chalice of the small blue-bell
May be discerned, by him who gazeth near,
A busy world, assailing eye and ear;
And not a flower in garden, field, or grove,
Nor blossom of the bough,
But is sonorous now
With voices eloquent of life, and joy, and love.

Come, then, my bird, and dream not of mischance,
Since thus all nature is astir with life!
Come! for the season gives not to my glance
The sweets with which thy presence made it rife;
And when autumnal gales begin their strife—
Long ere the winter furs the earth with snow—
Far hence may'st thou be gone,
To climes by us unknown,
Where spring smiles all the year, and cold blasts never blow.

Come, counsellor! for such wert thou to me.
Come! and once more let my first waking thoughts
Brood sweetly on thy home, thy young, and thee;
And, while my ear imbibes thy modest notes,
Thou shalt the lesson teach me, which promotes
The heart's best loves; and, seeing all the care
God hath of thee and thine,
Up to the throne divine
My soul shall mount, and find hope, peace, and comfort there.

May, 1842.

LARD OIL.

An Irish newspaper copies the following paragraph from a New York paper of recent date:—"Mr Ellsworth, in his report to the patent office, makes calculations to show that the United States may supply herself and Europe with an oil fully equal to the best sperm, and produced from *lard*. By a late discovery, it is found that lard yields an oil fully equal to the much prized sperm; and it is further found that eight pounds of lard are equal in weight to a gallon of oil, and that the whole is convertible into oleine or oil, and stearine, the latter very much resembling the spermaceti of commerce. The report also states, that if all the swine now in the States were slaughtered, and the lard converted into oil, the product would be five times greater than that of the whole whale fishery; and if only one-fifth of the pork now produced annually be devoted to the purpose of being turned into oil, the product in articles equal to spermaceti and sperm oil would exceed the proceeds of the spermaceti whale fishery. The expense of producing those substances is of course an important consideration, and, according to the report, when lard is 6 cents to the pound, the oil can be sold at a good profit at 50 cents per gallon, and the stearine is clear gain besides."

NUMBER 547. SATURDAY, JULY 23, 1842. PRICE 1½d.

A FEW WEEKS ON THE CONTINENT.

ENTER FRANCE—RETURN HOME.

We have at length reached the borders of Switzerland on the route westward by the Val Travers; and in the midst of a brown moorish region, environed by the superior heights of the Jura, our caleche has come to a pause at the door of the French douane, or custom-house. France is a country which it is equally difficult to enter or to depart from without examination or license; and at this point, which is situated directly in the great smuggling line of march, more than usual vigilance is exercised. Handed out by a functionary in a glazed steeple hat, a mustache, and a dirty sky-blue uniform, we were told to bring every thing for inspection into the bureau, while the seats and lining of the carriage were subjected to the usual scrutiny and search.

I wonder our painters never think of depicting such a farcical scene as that which now ensued—a group of douaniers round a poor carpet-bag, on which they look with the eyes of a terrier watching a rat. One fellow, after fishing to the bottom, brings up a soap-box or razor-case, or some such trifle, as if he had got hold of some amazing prize, but which he next minute relinquishes, and crams back with the usual French grunt of disappointment—Bah! While this is going on within the threshold of the office, in which are observed to be seated at desks a couple of nondescript functionaries in blue cloth caps with snouts, an "aside," as the players would say, is performing out of doors. The carriage and horses are in the hands of the Philistines. Having been pounced upon at first, the carriage has passed muster, and may now be supposed to be emancipated; but the horses, which stand whisking their long tails, and glad, I have no doubt, of a rest after their journey up the long mountain pass, have unconsciously on their part become objects of very particular attention. The aforesaid gentleman in the dirty sky-blue uniform examines their legs, feet, tails, colour of skin, streaks of white on their decent-looking countenances, and every observation he thinks fit to make as he proceeds is marked down with solemn gravity in a book held in the hands of an attending official. In short, it is a very serious affair; so serious that Jean, the owner of the concern, stands aloof with a face as gloomy as midnight, and as much as saying that he has got into a scrape which he heartily wishes he was well out of. Now comes the climax of the equine inspection. A tall measuring pole with a cross sliding bar at top, such as one may suppose to be employed in gauging recruits, is with all proper formality handed out from the bureau, and applied to the shoulders of the unfortunate animals. The thing was too ridiculous; and forgetting every consideration of time or place, the party—that is, the two ladies and myself—at once burst into a perfectly unrestrainable round of laughter. A smile passed over Jean's sunburnt countenance at this explosion, but so rueful and transient, and accompanied with such an embarrassing scratch of the head, as only added to the drollery of the scene. "What is the meaning of all this, Jean?" said I; "what are they going to do with your horses? Surely they do not take them for contrabandists?" But Jean had no time to reply, for he was now conducted into the bureau; out of which he came in about ten minutes, drawing together the mouth of his leathern purse, and mumbling something in German, I daresay not very complimentary to the laws of the grand nation. As the poor fellow folded up the steps of the caleche, and otherwise prepared for the road, he explained the mystery. It came to this—that he was charged fifty francs of duty upon his pair of horses; but that this sum would be restored to him provided he returned within twenty-four hours; and to insure his bringing the same animals back, the present examinations were instituted.

This was Jean's story, and it affords a pretty fair sample of the strictness of the French custom-house laws, which are here enforced with an excess of rigour—so much so, that one of the ladies of our party was charged three francs of duty on a printed calico dress, of Swiss manufacture, which no person of any delicacy would have regarded or meddled with. Such an organised interference with the freedom of trade and general intercourse reflects great disgrace upon the French, when compared with the practice on the Swiss side of the frontier, where there is no custom-house—no functionary to stop the way—no check of any kind on personal or commercial liberty. The French may send what goods they please into Switzerland, but they allow nothing to come back without being heavily taxed, and some kinds of merchandise are altogether intercepted. At the custom-house where we stopped, three large Swiss carts had been stopped for examination, and all their goods lay strewn on the ground, while we observed cars proceeding in an opposite direction towards Neuchatel, without encountering any species of hindrance.

If there were reason to believe that the French throve upon such contemptible interruptions to commerce, there might be some excuse for them; but this is by no means the case, if we may at all judge from external appearances. Within the Swiss territory, as I formerly observed, you see industry, neatness, and comfort. Every cottage, with its orderly arrangements, appears the residence of a happy though toiling family. At the distance of half a mile, within the French boundary, you see no such cottages, no industry, no neatness, no comfort. We have left a country in which the people unostentatiously but correctly manage their own affairs, and have entered another in which the people are clearly of no further account than as engines to be taxed and dragooned by a government over which they cannot be said to exercise the slightest control. The result in the one case is civil tranquillity and prosperity; in the other it is disorder and all the tokens of misery.

A more dismal ride cannot be conceived than from the French frontier to Pontarlier, at which we proposed to stop for the night. We no longer saw any of those evidences of personal exertion which have forced patches of wilderness into blooming cultivation, but, on the contrary, long stretches of bare hills with intermediate valleys of brown morass, and here and there a poor-looking hamlet, occupied by as poor-looking a set of inhabitants. Midway, at the pass of La Cluse, which formed the entrance to the valley of the river Doubs, in turning an angle in the road, we had on our left the Chateau de Joux, a castle regularly fortified and placed on the summit of a huge precipitous rock, like the castle of Edinburgh or Dunbarton. The night was closing in as we passed this ancient stronghold; and as we saw the lights twinkling through the mist and gloom from the lofty loop-holes, we thought that perhaps they shone from the dungeons in which had been immured the unfortunate Toussaint L'Ouverture, who, as is well known, was treacherously inveigled to France by Bonaparte, and imprisoned here, and who ultimately fell a martyr to the inclemency of another and similar dungeon at Besançon, to which he was consigned.

It is not my intention to detain the reader by an account of our journey to Paris, for the scenes we passed through were remarkably barren of interest; and there was nothing in the social condition of the people to form the subject of pleasing remark. Travelling in France is performed with much greater toil and difficulty than in any other country I know aspiring to civilised usages; for the towns stand considerably apart from each other; there are few villages, and these poor; the inns are inferior in accommodation; and, worst of all, there is generally no conveyance at command but the regular diligences in direct communication with Paris. Except that the roads are now pretty good, the traveller is placed at a very great disadvantage in comparison with the means ever ready for his service in any part of Germany or Switzerland. As respects accommodations for tourists, I should say France is a century behind Holland, Belgium, or central Germany.

We arrived late at Pontarlier, a town of several thousand inhabitants, and where, after encountering another stoppage from custom-house officers, we took up our lodgings for the night. I should have been glad to take our conveyance on to Besançon; but Jean had the fear of losing his fifty francs before his eyes, and by break of day he was off on his return homewards. We were now abandoned to all the horrors of French diligences; and I shall save both myself and the reader no small degree of pain by passing entirely over the account of our journey for several days and nights through Besançon, Dijon, and some other towns of lesser note, to Paris.

The only relief experienced in this most afflicting journey was a day's rest at Dijon, a large and populous town, anciently the capital of Burgundy, but now considerably decayed, and apparently possessing little trade. The day of repose was appropriately Sunday, and the weather being still beautiful, we had an opportunity of seeing the place in its holiday dress. All the shops, with two or three exceptions, were open; but, as I have repeatedly observed in France, no business of any description seemed to be going on, and they might as well have been closed. Coffee-houses and places of public amusement seemed to be the chief objects of attraction to the sauntering part of the population, while the services of religion were as usual abandoned to the priests and a few female devotees. To judge from outward appearances, religion was a matter of very small account in Dijon. One fine old Gothic church in the main street we found cleared of all its interior trappings, and occupied with the stalls of herb and fruit dealers. Another ancient church was similarly desecrated, and formed a market for the sale of hay; and a third was employed as a merchant's depôt for the sale of iron. Still, the 26,000 inhabitants have two churches left for religious service, both of which suffered greatly from revolutionary violence; but notwithstanding their dilapidation, they remain fine relics of an era of ecclesiastical splendour. An effort has lately been made to improve and beautify Dijon, by the laying out of public walks on the site of the ancient ramparts; and a very splendid jet-d'eau, with a circular stone basin, has been established at the southern entrance to the town. But none of these elegancies are kept in good order. Here and elsewhere, the remark was constantly forced upon us, that the French care little for the permanently useful in comparison to what is to make a momentary flash. In many places which we passed in our journey, the wreck of variegated lamps, left since the last rejoicing, hung upon edifices which greatly lacked a little repair; through the broken panes of glass in the churches peeped festoons of gum-flowers; and often the painted wooden figures, representing the crucifixion, which had been got up in a fit of pious enthusiasm, we observed to be broken or in a state of

neglected decay. The words, "*Liberté—Ordre*," which were frequently conspicuous in large letters on the front of Hotels de Ville, formed, as we thought, a miserable burlesque on the national practice of stopping a traveller at every barrier, and the order which is everywhere preserved by the presence of a strong military force.

All miseries come to an end, and so did those endured in the French diligence. We were at length set down at the bureau of the Messageries in Paris, and having had our luggage once more inspected—only the fifth time since entering the country—we were allowed to seek some repose after the fatigues of a two nights' journey. Paris, I was much pleased to find, had been greatly improved since my visit in 1834. Dress, manners, vehicular conveyances, pavements, streets, shops, all were greatly improved, and seemed like what one now sees in the more refined parts of London. Having spent a week in viewing some of the more interesting objects of attraction, we departed for England, and had the satisfaction of arriving safely at Dover, after an absence of nearly two months.

And so here, I daresay to the relief of the reader, is brought to a close this rambling account of what was, after all, a commonplace excursion, performed more with a view to recreation and health than to adventure; and which, as far as convenience would permit, took more the form of a glance at the social than the picturesque features of the country. The result was not unsatisfactory; and now, on looking back to what fell under the attention of our happy little party, and pondering upon it in connexion with what has been seen and described more perfectly by other travellers, I think I possess a somewhat better idea of Switzerland, its institutions and character, than I had previous to my visit, transient as that necessarily was.

It appears to me, on reflection, that there are some things favourable and others unfavourable in the condition of the Swiss, which have never, at least as far as I am aware, been clearly stated in opposition to each other. The people at large I consider to be highly favoured with respect to their forms of government: they number among them no aristocratic or privileged class; all are equal in rank; every man has a free voice in electing his representative to the cantonal parliament or legislative council. A natural consequence of these arrangements is the highest degree of civil liberty consistent with social organisation. This civil liberty is not a theoretic but a practical good; it is not a fiction in law, but a substantial fact. The principle wrought out is what Bentham calls the greatest happiness of the greatest number. In the first place, no particular class having the power to exempt itself from taxation, all burdens, be they great or small, are spread equally over the community. Then, there is no class of persons whose industrial produce must be purchased in preference to what can be obtained elsewhere; that is to say, there is universal freedom of trade, the poorest man being allowed to lay out his penny to the best advantage, no matter though the article he buys should come from the opposite end of the globe.

From these circumstances in their numerous combinations, along with a strong spirit of patriotism, which is sedulously encouraged, the Swiss may be said to have realised all that can possibly be expected from free political institutions. They protect themselves from aggression; secure internal tranquillity with protection of life and property; tax individual exertion with the smallest sum for the general behoof; and leave every one to work out that scheme of happiness and independence which his feelings and sense of duty dictate; in short, every man is permitted to toil for himself, to keep all he earns to himself, and, surrounded by the objects of his affection, to sit down, unharassed by external influences, under the shelter of his own vine and fig-tree.

All this is something. Switzerland, in every quarter, presents a spectacle of humble independence and happiness which it is exceedingly pleasing to contemplate. How far the happiness realised equals that attainable in other countries, is a question involving many intricate considerations. Happiness is altogether a relative term. The Frenchman is happy (I suppose) in thinking he is a member of a great nation, which has a tri-coloured flag, a large army, a citizen-king, a legion of honour, and a few colonies beyond sea, which there is much glory in protecting; and such considerations, probably, reconcile him to an empty stomach, bare legs, and a pair of wooden shoes. The peasantry in the south of France live in hovels and subsist on chestnuts; but who can say that they are on that account mentally depressed or unhappy? Self-delusion, though never sung by the poets, is a very accommodating equivalent for many substantialities.

To compare the condition of Switzerland with that of England would be absurd. There is not the slightest resemblance between them. The Swiss have pitched their standard of happiness at a point which, as far as things, not feelings, are concerned, could, with great ease, be reached by the bulk of the British population. And here what may be called the unfavourable features of Swiss society become prominent. There is little cumulative capital in Switzerland. It is a country of small farmers and tradesmen, in decent but not wealthy circumstances. An active man amongst them could not get much. If he and his family wrought hard they would not starve, and whatever they got would be their own. On all occasions, in speaking to respectable residents, the observation on the people was—"They labour hard, very hard; but they have plenty of food, and they are happy." Now, it is my opinion, that, if any man labour hard in either England or Scotland, exercise a reasonable degree of prudence, and be temperate and economical, he can scarcely fail in arriving at the same *practical* results as the Swiss; nay, I go farther, and will aver, that he has an opportunity of reaching a far higher standard of rational comfort than was ever dreamt of by the happiest peasant in Switzerland. The condition of the Swiss is blessed, remotely, no doubt, from the simple form of government, but immediately and chiefly from the industry, humble desires, and economic habits of the people. As I formerly observed, the people of Scotland alone contrive to spend *four millions* of pounds sterling annually on whisky; and if to this we add the injury caused by loss of time and deterioration of health, character, and circumstances, we have discovered an evil so monstrous as to leave no surprise that poverty and misery have been widely spread. This, however, is entering upon a topic too vast to be crowded at the end of these desultory sketches; and, therefore, leaving its discussion to a more favourable opportunity, I shall not trespass longer on the reader's patience, but make my obeisance and retire.

W. C.

SKETCHES IN NATURAL HISTORY.

EVIDENCES OF DESIGN IN THE STRUCTURE OF INSECTS.

INDICATIONS of design, or contrivances adapted to carry into effect a particular intention, are so obvious in the structure of animals in general, and so well calculated to carry conviction to the mind regarding the great truth of a designing intelligence, that it may seem superfluous to multiply instances with the view for which they have been often adduced. On this important subject the evidence is already as satisfactory as can well be conceived; and although additional examples, like so many separate rays of light converging to a point, may make that evidence more conspicuous, it can scarcely render it more conclusive. But it is always a source of much gratification to contemplate the means by which that presiding intelligence effects its purposes—to examine the mechanism it constructs for the purpose of adapting its creatures to all the exigencies of their nature. In so doing, we meet with so many examples of ingenious contrivances, skilful mechanical adjustments, subserviency of parts to a definite use, as well as an invariable beauty in the workmanship, that we cannot fail to receive beneficial impressions of the power, wisdom, and goodness that have been employed in the formation of animals.

Such instances are most apt to attract attention among the higher animals, where the parts, from being presented to us on a larger scale, are most obvious to the senses; but they are not less frequent, nor less interesting, among the lower tribes of the animal kingdom. This is the case, in particular, with insects, one of the most numerous of these classes, which live in such an infinite variety of circumstances and conditions, that more than ordinary scope is afforded, or more than usual necessity entailed, for modifications and peculiarities of structure to suit different modes of life. Singularly and most elaborately organised, and highly finished (so to speak) in all their parts, these little animals furnish obvious instances of design in their whole economy; but these instances are most striking in what Dr Paley calls *peculiar organisations*, that is to say, deviations from the ordinary structure, in order to provide for some particular want, or the creation of new parts to overcome, as it were, some specific difficulty. It is principally to such examples of the last-mentioned description as we happen to have met with in the course of our examination of insects, that it is our intention in this place to invite, for a brief space, the attention of the reader.

A large number of insects are raptorial, or prey on living individuals of their own class, at times even on individuals of their own species, for they are by no means particular in this respect. To enable such as are endowed with this propensity to seize and hold their struggling victims, some further provision is often requisite than a pair of trenchant and toothed jaws, because these can only execute their appropriate functions by alternately opening and closing, like the blades of a pair of scissors; and during the former act the captive would have an excellent opportunity to escape. The instruments employed to supply this want are generally the fore-legs; and many curious and interesting manifestations of design are to be seen in the modifications which these undergo, in order that they may be converted into prehensory or catching organs, their primary use, walking, being, at the same time, in no way interfered with. Strength and freedom of motion would be obvious advantages; we accordingly find that the fore-legs are by far the thickest and most robust, and instead of moving on a hinge joint, which admits of motion only backwards and forwards, they are connected with the body by a ball-and-socket joint, on which they can turn in all directions as on a pivot. They are also furnished with spines, which are probably in all cases more or less useful in disabling an antagonist; but in the following case these spines, by a simple mechanical arrangement, become efficient instruments for seizing an object. Near the lower extremity of the shank (or *tibia*), and on its inner side, there is a deep notch; immediately over this is placed a strong moveable spine: when this spine is pressed down, it rests on the opposite angle of the notch, and thus any object within the latter is, as it were, locked in. But the enclosed limb of a struggling insect would be apt to twist the spine to a side; what plan is adopted to prevent this? A short, strong spine, looking in an opposite direction, is placed on each side of the point upon which the principal spine closes, and thus effectually prevents any lateral movement. This structure is well exemplified in a small beetle (*Cillenum laterale*) found occasionally on the coasts. A provision of a similar kind exists in the common blister-beetle; but in this instance the spine is placed at the lower extremity of the tibia, and closes on the first joint of the foot (*tarsus*). There are no lateral supports in this case; the spine is therefore short and very strong.

No instrument can be more admirably fitted for its purpose than the fore-legs of the *mantes*, or soothsayers—insects so named from their appearance suggesting the idea of a person in the act of prayer, but which are pre-eminently raptorial and ravenous. The fore-legs of this creature are placed near the head, towards the extremity of a long and slender thorax, itself capable of considerable motion, and are very thick and strong. The thigh has a deep groove along its inner side, and along each of the margins of this groove there is a row of strong spines; the outline of this side of the leg is somewhat convex: the next portion of the leg (the tibia) is curved in the opposite direction, and folds back upon the thigh, falling closely into the central groove, just as the blade of a pocket-knife does into the handle. The whole apparatus is most complete and efficient. When the tibia ends in a long curved spine, as is frequently the case, that spine is turned to one side; and the tarsi, which are short and weak, fall backwards on the least motion of the tibia: unless both these provisions obtained, it is obvious that the latter could not close upon the thigh. No intention can be more clearly indicated.

It has been stated above, that one of the reasons for the legs being used to hold the prey is, that the jaws may have greater liberty of motion, without allowing the prey to escape. There are some instances in which the legs are in no way adapted to such a purpose; every thing, therefore, requires to be done by the jaws—and how is the risk of escape, in that case, provided against? *The jaws are perforated throughout their whole length*, so that, when once fixed in the body of the living prey, they do not require to be relaxed, its juices being sucked through the tube. This is the case with the larvæ of a tribe of water-beetles (*Dytiscidæ*), in which the legs are all required to balance and move the body in the water, and could not be spared for any other end.

Other means of seizing and fixing, of an equally curious nature, have been furnished to certain insects. The male scorpion-fly has a pair of forceps in its tail, and the water-beetle has an apparatus of the character of what boys called a *sucker*. The water-beetle is of less specific gravity than the element it inhabits, and liable, therefore, to be tossed about by every fluctuation of the waters. Hence the necessity for *some* means of attachment. The body is broad, flat, and nearly smooth, and hence the expediency of a sucker in preference to any other means. The apparatus consists of a broad circular disk, with several small cup-shaped suckers, varying in size, attached to its under side. It occupies the place of the tibia in the fore-legs.

Let us now take an example of the adaptation of the fore-legs to another purpose than that of seizing. Admirably as the common mole is fitted for mining its subterranean galleries, perhaps the structure of the fore-legs of the mole-beetle even more strikingly demonstrates design (if that be possible), inasmuch as the legs deviate more from the prevailing form among creatures of the same class, and require a greater number of modifications, in order that they may answer the end in view. It is impossible to fancy a more efficient digging instrument of its size—the ordinary uses of the leg remaining at the same time unimpaired. The thigh, and the joint which unites it to the body, are of great size and strength, and the tibia is expanded into a broad plate, which assumes a palmate form by being cut on its external edge into four pointed lobes. It is thus at once fitted to burrow into the soil and to shovel it when loosened to one side, the leg being so turned that its action is outwards and backwards. But the tarsi are still to be disposed of, because they would obviously impede this operation; and being comparatively weak, would run the risk of fracture. They are, accordingly, reduced to mere rudiments; and when the leg is in action, the few joints of which they consist are lodged in a groove exactly fitted to receive them. Could any arrangement be more perfect, or more strikingly testify intention?

The common mole can readily turn the passage it is digging in any direction it may please, although that passage is not wider than its own body; and this it is enabled to do by the flexibility of its spine. The insect of which we have just spoken can also turn its body, because the segments of which the latter is composed are flexible to a certain degree. But there are certain tribes of insects which burrow in the ground, belonging to that section of the class which have their bodies covered with a hard and bony case (*Coleoptera*); and unless some special provision were made to admit of lateral motion, they would be under the necessity, when excavating a gallery the exact width

of their body, to move forward almost invariably in a straight line. We have often admired the simplicity and efficiency of the means that have been resorted to in order to obviate this difficulty. The thorax, or trunk, of the insect is attached to the abdomen, or hinder portion of the body, by a pretty long and narrow cylindrical piece; and on this the thorax moves as on a pivot, its hinder angles being rounded off to admit of its motions being performed with greater facility. Now, all the insects most nearly related to these, but which are not subterranean in their habits, have the thorax broad behind, the hinder angles being rectangular, or even salient, which necessarily almost wholly prevents the sideward motion of a part of the body at once. The genera *Clivina* and *Scarites* afford examples of this structure. Their fore-legs are also constructed on the same principle as those of the mole-beetle, although the parts are not so highly developed. They likewise possess another organ, so beautifully adapted to their subterranean mode of life that it should not pass unnoticed. The antennæ, which are usually composed of conical joints, and are therefore somewhat rigid and unpliant, are, in this instance, formed of globular joints connected by a slender filament, resembling a series of beads rather loosely strung upon a thread. They can, therefore, be bent in any direction with the utmost ease, and are turned backwards while the insect is moving through the soil, so that they offer no obstacle to its progress.

How many beautiful examples of peculiar adaptation are to be observed in the legs of insects, in order to fit them for locomotion in the different places and elements in which they dwell! The crane-flies (*Tipulidæ*) frequent grassy meadows; and walking in such places to an insect with a heavy body and short legs, would be almost as difficult as for a man to pass through a thick plantation of young trees. The legs are therefore extended to that extraordinary length which gives these flies such a singular appearance; and they are by that means enabled either to *stilt* among the grass, or to walk over it, the limbs, from their length, resting on many blades of grass at once, and thus finding a sufficient number of points to support the body. But it must occur to every one that a still more useful and effectual kind of locomotion, among tangled vegetation and places where the wings could not well be used, would be the power of leaping. Multitudes of herbivorous insects we accordingly find to possess that property, and the hind-legs are the instruments by which it is usually effected. The thighs are greatly enlarged to allow the muscles sufficient development for this increase of power, and the other parts of the leg are so modified as not to interfere with the exercise of it. The efficiency of this instrument is best shown by its effects. Insects of very small size (such as the turnip flea-beetle, an object of much dread to farmers) can leap to a distance of several feet with the utmost ease, so that they are at once provided with the means of a rapid change of place, necessary, or at least highly desirable, in their search for food, and a mode of escape from many of their enemies. The structure in question is best exemplified in locusts and grasshoppers. In these the hinder thighs are very much elongated, and thicken gradually as they approach the body; the knee forms a large knob, to afford room for the somewhat complex articulation which unites the thigh to the tibia. The whole apparatus is strictly mechanical; and it would seem impossible that any one could examine it without at once perceiving what purpose it was intended to serve, even although he had never seen it in action.

WORLDLY WISDOM;

OR THE HIGHWAYS AND BYWAYS OF LIFE.

"You had better have taken my advice, Henry, and married the heiress three months ago," was the exclamation of Mr Varley to one of the two nephews who, with himself, made up rather a mournful trio, as they sat almost for the last time in his splendid drawing-room. The season was chilly November, the year that terrible one in the mercantile world—1825. Mr Varley had been reputed a very wealthy merchant. He had lived for many years in a most expensive style; and though there were ill-natured persons who hinted that Mr and Mrs Varley snapped and snarled occasionally at each other, in a manner not accordant with a very romantic idea of conjugal felicity, he must certainly have been a generous husband. In fact, he had behaved in a manner that those foolish romantic persons who have no idea of a separate purse or separate interests seldom think of doing. In the height of his prosperity, he had settled twenty thousand pounds on his wife beyond his own reach. It is true this circumstance was not generally known, but we shall see presently how it influenced his future career. Mr Varley had no children; but about five years before his failure, his nephews, Henry Carlingford and Alfred Varley, had entered his counting-house, the former bringing into the concern a small patrimony, the latter very little more than his services. Nevertheless, Alfred had become decidedly the uncle's favourite, for Mr Varley declared that Henry's head was full of "ridiculous notions," and that where any one of them was concerned, "he was as obstinate as a mule." Alfred, on the contrary, he pronounced to be "a shrewd clever fellow, who would make his way in the world;" and Mr Varley had a strong affection for prosperous people.

It was a very few days after the house of Varley and Co. had been declared insolvent—a failure, by the by, most unexpected—that our story opens. There are few scenes more painfully touching than the contemplation of a family suddenly reduced from affluence to penury; but certainly of our trio Henry Carlingford appeared the most afflicted. Perhaps Alfred Varley possessed more of the buoyancy of youth, and perhaps his uncle was a bit of a philosopher, or perhaps he considered that he could not be very painfully straitened while his lady possessed the interest of twenty thousand pounds. He had also just heard that the creditors intended behaving very liberally. Thus, though a certain air of gloom pervaded the apartment, he was less depressed than might have been expected, when he addressed Henry, exclaiming, "You had better have married the heiress!"

"In the first place, sir," replied Henry, "I am not sure that the lady to whom you allude would have married me; and secondly, I never admired her sufficiently to put the question to her."

"Nonsense—nonsense! Now, there is no chance of your making a good match; if you had married Miss Tarlton, and even half her fortune had been settled upon herself, as of course would have been the case, how different would your position now have been!"

"So different that I cannot contemplate it without horror; for however my own conscience might have acquitted me, the world would have considered me as a scoundrel."

"Well, well," rejoined the uncle, "some day you will better understand the advantages of a sure income."

"I do understand them, I assure you; but I value one thing yet more highly, and that is an unsullied character."

Having thus expressed his opinion on Henry's imprudence, Mr Varley turned the conversation more directly to their present circumstances, and this, after a little while, very naturally led to Alfred's more immediate interests. Here, however, there was a marriage to be broken off, instead of reproaches for its non-completion. Alfred had been engaged for nearly six months to the pretty and accomplished daughter of a London banker. But though Eliza Dalton was precisely the same individual with whom he had been all this time "desperately in love," he now congratulated himself most heartily that he had yielded to the delay urged on account of her extreme youth—for she was little more than seventeen—as, to use his own words, he felt there would be "madness" in thinking of her as a wife, now that her father had failed, and she would be portionless. There is a kind of speciousness, a correct reasoning warped to wrong purposes, which, like false coin, may, and does, for a little while pass current. It sounded all very right, and proper, and prudent, and self-sacrificing on his part to release Eliza from her engagement, and, now that their mutual circumstances were so changed, to leave her free again to choose; but it must be confessed these moral attributes are not the ones generally most highly appreciated by a young girl in the character of her lover. It would seem that even Henry Carlingford did not see the affair quite in the exalted manner which was intended, for after listening for some time to the discourse of his companions, the exclamation, "Poor girl!" escaped him, and he walked to another part of the room to conceal his emotion.

Both the Varleys had an aversion to "scenes" (though, in dreading one, they calculated far too little on the womanly pride which was inherent in such a nature as that of Eliza Dalton), and so they agreed each to dispatch a letter breaking the determination at which they had arrived—that of the uncle to Mr Dalton; the epistle of the nephew was to be addressed to his affianced. It must not, however, be supposed that the situation of Alfred Varley was utterly deplorable—very far, indeed, from it. From his knowledge of business, he had already engaged himself as head clerk in another establishment, with a very considerable salary, and Mr Varley was to resume the management of his own business for the benefit of his creditors. For Henry Carlingford a very different, and apparently a far more uncertain, career was opening. Sickened of the excitement consequent on speculations, and not having been fortunate in the specimens presented to him of the mercantile class, he had determined to abandon entirely all such pursuits. The study of anatomy and medicine had already been the recreation of many a leisure hour, and a wealthy member of his mother's family had now generously placed within his reach the means of prosecuting these his favourite studies, with the hope of qualifying himself for the medical profession. It does require energy and decision to determine, even at five-and-twenty, on a new path in life, and to turn every hope and aspiration into a different channel than heretofore; but energy and decision were among the peculiar characteristics of Henry's mind, directed as they were by those firm principles which prevented his ever turning out of the straightforward path of honour and propriety into any of the by-lanes of life, which, though they seem to the short-sighted very near cuts to fortune and fame, really only lead out of one cross-road into another.

It is scarcely worth while to examine very narrowly the early trials of Eliza Dalton. It will be better to judge of them by the influence their schooling had upon her character. Youth, with its keen feelings and soaring hopes, is the season of all others when afflictions fall most heavily; wisely and mercifully ordained is it, that they should usually leave behind them, when their wounds are healed and their sting departed, lessons of experience which mature the mind and develop the character, more, probably, than the fortunate occurrences of many prosperous years might have done. It seemed very dreadful to Eliza Dalton when first the intelligence of her father's reverses fell upon her ear; it was sad to think she must bid adieu to the home of her childhood, and yield it to the authority of a stranger; it was even a trial (however unromantic it may sound) to relinquish henceforth the luxuries to which she had ever been accustomed, and the control of wealth which her father had more recently permitted; and saddest, most agonising of all, was it to mark *his* anxious careworn face. Yet amid the deluge of affliction, there seemed one ark of joy and happiness; what, then, must her emotions have been when that was wrecked?

She was alone when the letter of Alfred Varley arrived, and she read it twice or thrice without seeming to gather its meaning. True, they could not be married yet; that she had instinctively felt the first moment that the knowledge of their mutual reverse of fortune had reached her; she had already accustomed herself to look through a long vista of exertion on his part, and at the end most probably a mere competence—for there *was* the prospect of a competence—instead of the once anticipated affluence. But to be relinquished—cast off for ever—such a thing had never entered her imagination, and her mind was slow to comprehend it. After a few minutes, however, some scintillation of the truth must have reached her, for, pressing her hand to her brow, she sought her father's chamber, and placing the open letter in his hand, leaned upon his shoulder, and, while he read, again perused it.

"Sordid wretch!" exclaimed Mr Dalton; "but, darling, I rejoice"—— The sentence was not completed, for Eliza would have fallen to the ground had not his open arms received her.

Mr Dalton was a strong-minded man, and one of deep feeling. He had been for some years a widower, and his whole affections were centred upon his three children, of whom Eliza was the eldest. The change in his worldly position had, in a few weeks' time, added in appearance the weight of many years to his age, and threaded his dark hair with silver, but it had failed to wring from his heart such tears of agony as those which fell upon the insensible form of his daughter. His first impulse had been to call for assistance, but a second thought restrained him, and placing her upon a sofa, he succeeded in a few minutes in restoring her to consciousness; it was her father's tenderness which touched some chord of feeling, and her heart was relieved by tears.

It must not be supposed that Mr Dalton's grief was at breaking off the match. Very far from it; but he knew enough of woman's nature to comprehend the struggle that was going on in the heart of his darling child. Oh! how holy is the bond when a parent is also a *friend!* They spoke unreservedly, and with her hand clasped in his. In the course of a very few *hours* Eliza listened, almost with composure, to her father's ejaculations of thankfulness that Alfred's character was unmasked. In a few *days* she spoke of plans for the future almost with animation; of how much she could improve her younger sisters and herself without the further aid of masters, and how pretty she could make the cottage to which they were about to remove. In a few *months*, though looking paler, thinner, and much older than before, she had regained, to all appearance at least, a flow of cheerful spirits. She had become, if possible, dearer than ever to her father; she had become his confidential and favourite companion, the undisputed economical mistress of his reduced establishment, and the instructress of her younger sisters. She was also more happy. The truth was, that the proof of Alfred's unworthiness had stripped her idol of its divinity, and discovered to her, what is more often the case with the very young than they are willing to acknowledge, namely, that their love is rather the imagined embodiment of their own ideal, which cannot endure the test of time, the great truth-discoverer, than a real attachment that deserves to be permanent. Leaving Eliza, however, to the intellectual pursuits and domestic duties which opened to her a more extended and purer kind of happiness, we will follow for a little while the fortunes of Henry Carlingford.

He had pursued his studies most assiduously for the requisite term, and had commenced what is called "walking the hospitals," when his attention was drawn to an old man whom he observed almost daily among the patients that called for gratuitous advice. He seemed to grow weaker and weaker; and, actuated by a feeling of benevolence, Henry on one occasion followed him to the door, and believing that he saw before him a decayed gentleman, offered, in as delicate a manner as possible, to attend him at his own home. The old man, whom we will call Selby, looked up as if surprised, and exclaimed, almost pettishly: "I can't pay you, sir; I can't pay you."

"I do not desire it," returned Henry; "you are not in a fit state of health to brave such weather as this (it was raining at the time); and if my skill and experience, such as they are, can be of any advantage to you, they are quite at your service."

Certainly this kind offer was not received and accepted in the most gracious manner; but Henry perceived that he had a character to deal with, and towards noon, on the following day, he wended his way to the street named by his eccentric acquaintance. It is no unusual thing for the attics of houses (the lower parts of which may be occupied as counting-houses by the wealthy merchant) to be let out in single rooms at comparatively low rents to some needy persons, who yet have business or occupation which requires their presence in the metropolis. It was in a mean apartment of this description that Henry found the old man; but it seemed to him a singular coincidence that the ground-floor should be tenanted by the firm in whose service his cousin Alfred now was; for though he knew the street and house very well, he had never before observed the number.

As Henry was leaving the house after having performed his required duty, he encountered young Varley; and not being very expert at parrying cross-questions, his cousin was soon apprised of the object of his visit. At first Alfred's countenance fell, in a manner that surprised our doctor, but in a few moments recovering, or assuming composure, he burst into a sort of forced laugh, and holding out his hand to Henry, exclaimed, "We must enter into partnership, my straight-laced cousin, or else I see that you, in the most unconscious manner, will cut me out with the old miser. Ah! I see you don't know him: he has not chick or child in the world — rich as Crœsus—lives here to be near the stock exchange, where he dabbles pretty often—hasn't an idea we know this, though, for he is always talking of dying in the workhouse; if one could but get booked in his *will*—don't think he's made it yet; do you?—can't live long, I'm sure—*how long* should you think?"

Henry did not give a very satisfactory answer to this question; he had been shocked at the abrupt confession of his cousin's scheming (the upright always detest manœuvring), and perhaps more grieved than angry at the deception which had been practised on himself. His compassion for the desolate old man—whose life would not in all human probability be prolonged many months—had been strongly excited; and though respect was necessarily gone, pity remained, and he continued to visit him almost daily. Involuntarily, perhaps, his manner grew less cordial, as he perceived, in many trifling circumstances, "confirmation strong" of all Alfred Varley had declared, though, from a feeling of principle, his attentions were still unremitted; while the miser, as if to widen the barrier which was growing up between them, persisted in treating Henry as the party obliged, speaking constantly of the experience he must derive from the treatment of his case. Weeks thus passed away; sometimes, though not often, he met his cousin, who latterly, he fancied, rather shunned him than not.

A circumstance, however, was about to occur, which opened a new chapter in the life of Henry Carlingford, and probed his feelings to the quick. He had been in the habit of visiting, on terms of intimacy, at Mr Dalton's "cottage," and in a manner, that would be strange but that it is common, had grown fervently attached to Eliza, without being conscious of the fact. Certainly there could be few characters more suited to each other than their's were, and no circumstances so likely to awaken the purest regard as those under which he had seen Eliza Dalton—the youthful, gentle, yet wise mistress of a home she made dearer to her father than his early abode of affluence. Still, Henry had been so accustomed to consider her as the early betrothed of his cousin, that it was only by the incident to which we allude that he was awakened to the knowledge of his own feelings. On arriving one day at the cottage, he was startled by the agitated manner in which Mr Dalton received him.

"Harry," cried the latter, drawing him towards a vacant room, "I want much to speak to you. Pray, tell me, have you suspected any thing of this sort?" and, while speaking, he placed an open letter before him.

It was a letter from Alfred Varley to his some-time affianced, couched in terms of the most passionate regard. He spoke of the "cruel sacrifice he had made, by which his heart had been nearly broken," and to which he had only been actuated by a fervent desire for her happiness; but finding her still unmarried, and his own prospects brightening, he could no longer refrain from once more throwing himself at her feet. The letter was filled up with those fervent expressions of unalterable attachment which, when echoed from one heart to another, seem a natural and proper language, but which, under different circumstances, or to third persons, are apt to appear a very different sort of thing.

The perusal of this letter unveiled poor Henry's heart to himself, and it was with a pale cheek and trembling voice that he besought Mr Dalton to tell him in what manner his daughter had received it.

"She is in a most agitated state of mind," continued the father, "and it is this which grieves me. I did not believe she entertained for him one lingering feeling of regard. I thought she now rejoiced as much at the rupture of their engagement, as I have always done. But I know how delicate a thing is a woman's heart; and though she is willing—I may say desirous—to reply at once, and decline firmly all future overtures, I have determined to wait for a week or two, not only that I may make inquiries as to his conduct since we lost sight of him—and certainly, as Eliza's worldly prospects are no way changed, this letter goes far towards proving that we judged him harshly—but that I may also give time for her own decision. Tell me, have you ever suspected the state of your cousin's feelings?"

"No. But we are not intimate, and have seldom or never spoken on this subject."

Henry Carlingford left the house without seeing Eliza Dalton, or it is probable that some word or look might have unsealed his lips, and at least all future misunderstandings have been avoided. But impressed with the conviction that her heart was still devoted to his rival, he had not the courage to meet her.

It was on the third morning from that eventful day that Henry, as usual, paid his benevolent visit to the old miser. Within the last week or two, however, a change might have been observed in Mr Selby's deportment. He had grown more deferential and respectful to his young doctor; and it was evident that he had become aware that Henry knew that he was no object of charity, at least in the common acceptation of the term. Growing day by day more feeble, it seemed that as his body decayed his mind became less grovelling and worldly. He seemed conscious that his end was approaching; and as if anxious to exculpate himself in Henry's eyes, he briefly sketched his history. Some minds there are which, tried by adversity, come out like gold from the furnace, but his was not of this order. Jilted by the woman he had loved, and cheated of his fortune by the man he had called his friend, he lost all belief in moral excellence; and where there is not at least faith in virtue, the mind must narrow and wither. Reduced by the fraud which had been practised on him from the possession of a competence to utter dependence, he had still, by a course of persevering industry, acquired a considerable fortune; but with no tie of affection, and no hope of ever forming one, he seemed not to be linked in the chain of humanity: he made gold his idol, and loved and worshipped it for itself. Still, where there has once been known kindly feelings, it is possible that some chord may be found to reawaken them. The bad leaven was sufficiently powerful to prevent his sacrificing one grain of his "divinity" while his dying fingers could grasp it; but even a miser has some consciousness that mammon passes not through the gates of death. It was not the kind and skilful benevolence of his friend which had awakened his better impulses, though something there was in Henry's loftier nature (as, indeed, the choice of him for a confessor proved) which wrung from him the tribute of respect which inferior minds are compelled to pay. Far less did the designing attentions of Alfred Varley meet with any other than their fit and usual reward; but the old man's dormant admiration had been awakened by a sense of—JUSTICE. In early life he had known Mr Dalton intimately, and had watched the rise and fall of his fortunes. He knew that the wealthy banker and the poor gentleman had been alike a man entitled to respect, and more than all, he had chanced to receive only a few weeks ago the last dividend due to him as a trifling creditor, knowing that it was by the sacrifice of many thousands which he might have retained, that Mr Dalton had been enabled to discharge every claim upon him. He had heard, too, from an old servant, of the exemplary conduct of Eliza, and, without knowing the name of her early lover, something of her private history. From sympathy, admiration, or perhaps many mingled feelings, he had determined on making her his sole heiress, though, undoubtedly, his attention had been drawn to the family by his thorough appreciation of Mr Dalton's upright character.

It was after relating his history to Henry Carlingford far more minutely than we have done, that, softened by his emotions, he took from behind his pillow a paper—it was his will. He asked Henry to read it to him, complaining of his feeble sight, but expressing a desire to be once more sure that it was in all respects correct and binding. It was while complying with the miser's wish that a lightning-like flash of thought convinced Henry Carlingford that his cousin Alfred had in some manner become acquainted with the nature of the document. His voice trembled as he concluded, and he left that poor chamber sooner than he had intended; but he spoke kind words to the old man, and pressed his hand more warmly than usual. He had obtained a clue to the discovery he instantly sought to make, for one of the witnesses to the will was a fellow-clerk of Alfred's. It matters little how he assured himself of the truth of his conjecture, or how, from a sense of duty, he disclosed to Mr Dalton the plot which had been laid by his unprincipled cousin. But our story would have been shorter if Eliza Dalton had sent her definite refusal to accept his addresses one day before the discovery of his heartless villany. Then Henry Carlingford would never have suspected in her a lingering regard for her former lover. As it was, he misunderstood the depression of spirits which even the possession of thirty thousand pounds (and of that fortune she became mistress in a very few weeks) failed to banish; and her wealth, to *his* sensitive mind, raised a barrier between them. Yet he loved on, almost against his will; for in his struggles with himself he separated himself from her society, till by degrees he even ceased to visit her family.

Years passed on, working their strange revolutions in the balance of fortune's wheel. Seven years after the miser's death, the Varleys were, what they would have called in others, "all to pieces." Mrs Varley was dead, after having squandered all the property, and her husband had sunk to the condition of a clerk in a third-rate house of business in a country town. The career of his nephew, Alfred, has not been much more prosperous. With a view of making a business for himself, he was guilty of much double-dealing and ingratitude towards his employers; and though he escaped the arm of the law, he was of course dismissed by them, and has now no regular occupation; it is indeed a marvel how he finds the means of subsistence.

But let us close this sketch with a brighter picture than the one we have just presented. Those same seven years had raised our young physician high on the ladder of fame. He had steadily pursued the straight highway of life, and yet had made stepping-stones of the favourable "opportunities" which had presented themselves in his path. Although ever a friend to the poor, his chief connexion lay among the noble and the wealthy, at whose houses he was frequently an honoured guest. It was on one of these occasions, and when the conversation was on literature, that it turned to some admirable works which had lately been published, and which had attracted the notice and admiration they deserved. There was some degree of mystery, however, about the author, and Lord F——, the host, after listening for some time to the discussion, startled them by declaring, "I *know* it is a lady, and more than that, you shall next week be introduced to her."

"The name—the name—who is she? who can she be?" exclaimed two or three voices.

"Nay," rejoined Lord F——, "if I promise you so great an honour, you must indulge me with the enjoyment of a little mystification. Her name is one you have often heard. All I shall tell you is that she is young—certainly under thirty—and handsome; and that she is the chosen friend of my daughter, chosen by me as much as by herself; for to a girl of Emily's age, I think the advantages of such a friend, some half-dozen years her senior, are beyond the highest estimate. Come all of you and dine with me next Tuesday, and at all events we will invite the author of —— and her father to meet you."

The authoress was Eliza Dalton! Seven years had taken no beauty from her person, but had added much power to her mind. Her younger sisters were already married; but it was suspected, nay, she had been known to say, that she should never marry. Such resolutions, however, are occasionally broken; and certain it is, that within three months from that memorable dinner party, she made some confessions to Henry Carlingford touching her depression of spirits at the period of receiving her legacy, which quite relieved his mind from any anxiety on that subject; and about the same time she fixed the day to meet him at the altar, to be no more divided. Her proud happy father gave her with joy to the man of all others he deemed most worthy of her, and Lady Emily F—— was her bridesmaid.

OCCASIONAL NOTES.

CYCLE OF THE SEASONS.

WE find the following paragraph in the *Leeds Mercury*:—"Mr Luke Howard, F.R.S., of Ackworth, near Pontefract, who has carried on careful meteorological observations for about forty years, has published the result of his observations through two complete cycles of eighteen years each. The result shows a very great general resemblance between the two periods; and Mr Howard is convinced that in each cycle there is a succession of years above the average degree of warmth, and a succession of years below the average. It is very agreeable to find that we have now just arrived at the close of one of the colder periods, and are entering upon one of the warmer; and Mr Howard anticipates that this and several successive years will be genial, warm, and generally favourable to abundance of the products of the soil. The subject is one not only of great curiosity to the scientific, but also of practical importance; and observations like those of Mr Howard cannot be too closely conducted. The reader ought to be aware that in eighteen years the moon, the sun, and the earth, come into the same relative position towards each other as they were in at the beginning of the period; and the theory is, that the temperature, moisture, winds, &c., on our globe are materially affected by the relative positions of the sun and moon towards her."

Efforts to ascertain general principles with regard to the character of the seasons have so invariably ended in disappointment, that Mr Howard must be prepared for some difficulty in convincing the world of the truth of his system. We are struck, however, by the idea of a series of propitious following a series of unpropitious seasons, because it is analogous to some other parts of the great scheme of Providence. We can work by day; but by and by the night cometh when no man may work. The fruits of the earth are produced only at one season; and we must prepare in summer and autumn for the absence of all natural sustenance from the surface of the earth in winter. Man can labour powerfully and successfully for his support till past middle life; but by and by comes a time of old age when he cannot labour, and when he is, or ought to be, supported by the results of the industry of his better days. All these arrangements bear reference to a faculty of foresight in the human mind, which operates to make us provide in the one season for the wants of the other; and society would soon be in a dreadful state indeed, if night, winter, and old age were not regarded by a very considerable portion of the species. This foresight is one of the most remarkable distinctions of man; but it is lamentable to think by what a great number of persons—we may say whole classes—it is scarcely at all exercised. How many, even when their receipts are far above the average, are contented to eat up each week their whole weekly earnings, never once thinking there is such a thing as a savings' bank or a friendly society in the world! How many in the middle ranks go on from year to year living in comfort without any provision for the possible death of the head of the family, though life-assurance supplies all that could be desired in that way from the present possession of a large hoard of savings! [By the way, life-assurance must yet be far from being generally understood: we lately heard with astonishment of a clergyman in Dundee having spoken discountenancingly of it in the pulpit—endeavouring to place

religion in opposition to one of the most virtuous acts of a man's life!] However much it may be disregarded partially, labour and self-denial at the favourable season, for the sake of provision against the unfavourable, are distinctions of human kind, and they are proud ones. It would be curious to discover that nature contemplates also, as a regular matter, something like a constant realisation of Joseph's dream, namely, that in one portion of so long a space of time as eighteen years, there should be a provision made for another portion of it—for such must be a natural inference from Mr Howard's theory, if it prove correct. It is a question interesting to the moral as well as to the natural philosopher, and we would hope that due efforts will not be wanting to bring it to a point of certainty.

IMPROVEMENTS IN TYPOGRAPHY AND PRINTING.

The history of printing presents a remarkable illustration of the active and improving nature of the last half century in comparison with some of the whole ones which went before. Till the French Revolution, the printing press continued to be the same rude and clumsy wooden machine which it had been in the hands of Faust and Guttenberg. A mechanician of the present day laughs at the idea of its homeliness and imperfect adaptation to its work. Its first three centuries and a half passed without its ever being thought improveable. Then came a time when everything was challenged, and the printing-press amongst the rest. Lord Stanhope and others applied their minds to produce better presses, and succeeded. There have been since then certainly not less than six various improved constructions of press, all of them respectable, and some excellent. There has also been the *printing machine*, that wonderful engine which takes in blank paper at one end and sends it out fully printed at the other, by dint merely of a handful of coal in the furnace of a steam-engine—which has allowed of the serviceable phenomenon of cheap literature—and makes it possible to publish a large impression of a newspaper while the news are still hot. The old cushions for inking have in the same period been dismissed, and replaced by the elegant and handy rollers. Now, if we are to believe a correspondent of the *Morning Herald*, a machine has been invented and patented for setting up types.

This machine, according to the gentleman who has made it known, "has a resemblance to a cottage piano, with the external framework removed. It has 72 channels containing a complete font of type, under which are placed levers in connexion with keys similar to those of the piano, each key having engraved on it its character, which corresponds with the channels above, in which the different letters are placed. As the letters are moved out of the channels by the action of the player, they slide through various curves on an inclined plane at the back of the machine, and fall to one point, where they are received into a spout and beaten forward to a composing stick, or, as it is called by the mechanist, a justifying box, by a very ingenious mechanical movement. This justifying box is at the end of the receiving spout, and the type is drawn into it in lines of the width of the page to be set up; and when the usual number of lines have been justified, the box is emptied into a galley in the way that the compositor empties his composing stick. While this 'setting up' of the type, as the printers term it, but which here is in reality 'letting down,' is going on, the channels are being fed by two boys. The rapidity with which this machine gets through its work may be judged of from the fact, that type equal to half a column of this Journal was justified in a few minutes less than an hour; that is, as fast as the reporter usually transcribes his notes. At this machine there are eight persons employed, three intelligent young women and five boys. The first are alternately engaged two hours each in composing, justifying, and correcting. The same system obtains with the boys, one of whom turns the wheel before spoken of, two, as has been stated, fill the channels, and two distribute the type. A clever compositor will set up 2000 letters in an hour, but the average is about 1500 or 1600 letters. The young women whom we saw compose at the machine have, as they stated to us, been learning for about three months, and the average rate at which they *justify*, for we observed that the composer was sometimes *too quick* for the justifier, is about 6000 letters per hour." How far the machine will answer the desired end, when employed upon moist and soiled types, such as are found in ordinary use in printing offices, we are presented with no means of judging.

In type-founding, there have also been some improvements of late. Some of the larger and more elaborate letter has been reproduced in the most beautiful style by the electrotype. In this art, there has always been a disadvantage felt to attend the want of a fixed standard of size for the *bodies* of the types, so as to admit of one founder's type ranking with another's; and also for the sake of nice adjustment when types of different sizes have to be amassed in one page. This desideratum has lately been supplied by the laudable enterprise and ingenuity of Messrs Bower, Brothers, of Sheffield. These gentlemen have pitched upon one kind of type (*pica*) as a standard, making it invariably one-sixth of an inch in depth of body, and making all other kinds of types in certain fixed proportions of that size. Consequently, a page of types of any variety of sizes may now be locked up with a degree of precision and neatness never before attainable. It is certainly remarkable that such simple mathematical principles have not been before now applied to type-founding, but this does not make the merit of those who have now set an example in applying them the less.

TRAITS OF AN ANTIQUARY.

Mr Nicholls, in his Illustrations of Literary History, has preserved some curious traits and anecdotes of the antiquary, Dr Browne Willis, to whom the public was indebted for the first correct and ample accounts of the great churches of England. Dr Willis was descended from a family of moderate fortune in Buckinghamshire, and was born in 1682. The peculiar character of his mind was awakened when he was attending Westminster school. He loved to walk and contemplate in the neighbouring abbey. The solemnity of the building, the antique features of the architecture, the old legends of the monuments, filled his whole mind. Transferred to Christ Church, Oxford, the appetite of his mental nature was fed by the similar objects which there met his eye—the grand tower of the mighty Tom, the superb hall where nearly every sovereign of England from the eighth Harry had been entertained, the adjacent cathedral church, where the tombs of Saxon saints are still shown, not to speak of the many other ancient buildings and objects of historical interest in Oxford. He grew up an antiquary, as a matter of course; and although he not only married, but served for a short time as M.P. for Buckingham, the rust of the profession soon settled over him, and he became the odd eccentric being which he continued to be till the end of his life.

Great acuteness in the reading of old papers and inscriptions, accurate habits in the ascertainment of facts, a memory capacious enough for any amount of lumber, and diligence and perseverance unwearable, were the qualifications of Browne Willis as an antiquary. It is an almost essential peculiarity of the antiquarian mind to narrow itself to some special set of objects, and to have no interest in any other. Willis affected only English ecclesiastical antiquities. Beyond his own country, and the middle ages of *it*, he had no sympathies. He gave up all good opinion of a young clergyman of his acquaintance who unguardedly declared one day that he would not give one page of Sallust or Cæsar, Livy or Tacitus, for all the monkish writers, with Bede at the head of them. This reminds us of Scott's turning coldly from the classical antiquities of Rome, and inspecting with enthusiasm a fortress of the fourteenth century. The collections which Willis made in his favourite walk enabled him to publish "The Cathedrals of England," in three volumes quarto, and "The Mitred Abbeys of England," two volumes. His principal other work was one entitled "Notitia Parliamentaria," referring to the parliamentary history of the various counties and boroughs of England. He lost money upon all of these great books except one; and the fifteen pounds which he gained upon that one he very characteristically gave, with a farther sum out of his own pocket, to build the steeple of Buckingham Church. The style of his writings is much more easy and elegant than any one looking at his character as an eccentric student could have expected. His antiquarian pursuits were conducted at an expense which impaired his fortune, for he personally visited most of the places which he described, and he never grudged a good sum for any antique curiosity that was brought to him. But though he began life with a property of L.2000 a-year, and reduced this to one-half, he possessed a benevolence which shrunk from raising the rents of his tenants, even when a rise would have been fair. He also spent much in repairing and beautifying certain of the neighbouring churches in which he took an interest, and supported three charity schools. To enable him to indulge in this liberal disposition, he denied himself and his family many gratifications; would himself wear a suit of clothes two years, and forbid his daughters a visit to London as too expensive, though necessary to complete their education.

The character of him read after his death to the Society of Antiquaries, described him as "strictly religious, without any mixture of superstition or enthusiasm, and quite exemplary in this respect." His antiquarian habits appear, nevertheless, to have given a certain strange twist to his religious feelings. He had become so accustomed to attach importance to the fact of what saint a church was dedicated to, and what day, accordingly, was observed as it as most sacred, that saints' days became to him of more account than they are with the most rigid Catholic. He regarded visits to churches as *pilgrimages*, and would put himself to considerable inconvenience and expense in order to be able to visit any one in particular on the day of the saint to which it was dedicated. When in London, on St George's Day, he would run about the whole forenoon, from one St George's Church to another, in order to be present at the services of as many as possible. He is known on one occasion to have gone from his house of Whaddon Chace, in Buckinghamshire, to Bristol Cathedral, in order to visit it on St Austin's Day, such being the day of its dedication. It is added, that he would lodge in no house there but the abbey-house. Having built a chapel at Fenny Stratford, in his neighbourhood, and placed it under the care of St Martin, he erected in it a tablet to the memory of his grandfather (who was probably born on that day), with the following inscription:—

> "In honour of thy mem'ry, blessed shade!
> Was the foundation of this chapel laid.
> Purchased by thee, thy son and present heir
> Owes these three manors to thy sacred care.
> For this may all thy race thanks ever pay,
> And *yearly celebrate St Martin's Day!*"

It must be explained to such of our readers as are not acquainted with English customs, that there is an ancient fashion still in some measure kept up, of holding merry meetings called *wakes* at parish churches, on the day of the saint to whom the church is dedicated. Browne Willis one day, riding over Mendip, came to a small church under the hill, and called to a rustic to ask its name. "Emburrough." "When was it dedicated?" "Talk English, or don't talk at all." "When is the revel or wake?" The clown thought, as there was a match at quarter-staff for a hat in the neighbourhood, this queer-looking stranger might intend to make one, and so he instantly challenged him. Let the reader only imagine for a moment the disgust of the disconcerted antiquary. This story naturally leads on to another, of which the humorous point is much the same. Dr Willis one day took a friend of the name of Loundes along with him in his old-fashioned coach to inquire after antiquities at a certain old grange on a distant part of his own estate. A coach driving into the farm-yard sufficiently alarmed the family, who betook themselves to close quarters; when Dr Willis, spying an old woman at a window, thrust his head out of the coach, and cried, "Woman, I ask if you have got no *arms* in your house." It being at the time of the rebellion of 1745, when searches for arms were talked of, the woman answered in great dudgeon, little thinking that it was only an antiquary crazed for old dags and hagbuts. It was not till Mr Loundes took up the task of explanation that an amicable understanding was effected between the parties. A third story follows as naturally, though not referring to Willis, but to a Dr Newcome, an equally devoted antiquary. Passing one day in his coach through a village near Cambridge, and seeing an old mansion, he called out to an old woman, "Woman, is this a *religious house*?" "I don't know what you mean by a religious house," said she, "but I believe the house is as honest a house as any of yours at Cambridge."

Utter abandonment to his favourite studies had taken from Dr Willis all sense of decent external appearance. In any dress he would have looked whimsical; but he added to the effect of an extraordinary countenance and figure by wearing only old clothes of the most ridiculous fashion. Two or three ancient coats, confined by a leathern belt round his waist, were surmounted by an old blue cloak, lined with black fustian, which had been made when he entered parliament. The head displayed a tie-wig worn nearly to the stumps, underneath an old slouched hat; at the opposite extremity were a pair of boots fully forty years old, which only came half up his legs, and were full of patches and wrinkles. *Old Wrinkle Boots* was one of the names by which he was known in his neighbourhood. His chariot, purchased for his marriage at an early period of his life, and never changed, was garnished with brass plates bearing his arms, and looked not unlike a coffin. As might be expected, he was extremely dirty; and it was something of a trial, for a lady at least, to be seated near him. He had at the same time some pride, and was not pleased with any one who did not address him as *Squire*. While so fond of churches, it is rather odd that he was constantly quarrelling with the clergy. It could scarcely be said that he had a predilection for any thing of a modern description; yet if there was any exception, it was in favour of the town of Buckingham, which he had represented in parliament. He was always scrupulous to speak of it as the *county* town, and he made great efforts to obtain for it such distinctions as the change of its bailiff into a mayor, and causing the archdeacon and bishop to hold their visitings at it.

Our antiquary had four daughters; and never was a gentleman's family more awkwardly situated in the matter of a father. A lady who knew him well, writing to another on this subject, said, after describing him, "You may judge what kind of education such a man is likely to give four girls, who have no female directress to polish their behaviour, or any other habitation than a great rambling mansion-house in a country village." The lady who wrote thus was Miss Talbot, of whom one of her own friends gave this admirable character—"She censures nobody, she despises nobody, and, whilst her own life is a pattern of goodness, she does not exclaim with bitterness against vice." Her letters supply a number of particulars as to the Misses Willis, written in a strain of great humour, but without ill feeling. "Browne," she says, "distinguishes his four daughters into the *lions* and the *lambs*. The *lambs* are very good and very insipid; they were in town about ten days, that ended the beginning of last week; and now the *lions* have succeeded them, who have a little spirit of rebellion, that makes them infinitely more agreeable than their sober sisters. The *lambs* went to every church Browne pleased every day; the lions came to *St James's* church on *St George's* d which to Browne was downright heresy. The *l* thought of no higher entertainment than going ' some collections of shells; the *lions* would see thing and go everywhere. The *lambs* dined,'

day, were thought good awkward girls, and then were laid out of our thoughts for ever. The *lions* dined with us on Sunday, and were so extremely diverting that we spent all yesterday morning, and are engaged to spend all this, in entertaining them, and going to a comedy—that, I think, has no ill nature in it; for the simplicity of these girls has nothing blameable in it; and the contemplation of such unassisted nature has something infinitely amusing in it. They follow Miss Jenny's rule of never being strange in a strange place; yet in them this is not boldness." Miss Talbot goes on to say—"Their remarks on every thing are admirable. As they sat in the drawing-room before dinner, one of them called to Mr Secker, 'I wish you would give me a glass of sack!' The Bishop of Oxford came in, and one of them broke out very abruptly—'But we heard every word of the sermon where we sat; and a very good sermon it was,' added she, with a decisive nod. The Bishop of Gloucester gave them tickets to go to a play; and one of them took great pains to repeat to him, till he heard it, 'I would not rob you; but I know you are very rich, and can afford it; for I ben't covetous; indeed I ain't covetous.' Poor girls; their father will make them go out of town to-morrow, and they begged very hard that we would all join in intreating him to let them stay a fortnight, as their younger sisters have done; but all our intreaties were in vain; and to-morrow the poor *lions* return to their den in the stage-coach. I have picked out some of the dullest of their traits to tell you. They pressed us extremely to come and breakfast with them at their lodgings, four inches square, in Chapel Street, at eight o'clock in the morning, and to bring a staymaker and the Bishop of Gloucester with us. We put off the engagement till eleven, sent the staymaker to measure them at nine, and Mrs Secker and I went and found the ladies quite undressed; so that, instead of taking them to Kensington Gardens, as we promised, we were forced, for want of time, to content ourselves with carrying them round Grosvenor Square into the ring, where, for want of better amusement, they were fain to fall upon the basket of dirty sweetmeats and cakes that an old woman is always teazing you with there, which they had nearly dispatched in a couple of rounds. It were endless to tell you all that has diverted me in their conversation and behaviour." One other story of these girls. The father once paid a visit to a gentleman at his chambers in one of the colleges in Oxford, in order to look into some old papers. After he had sat a while, a bed-maker opened the door, and enabled the gentleman to hear something like a rustling of silk in the stair outside. "What noise is that?" he inquired. "Oh," said Dr Willis, "it is only one of my daughters that I left on the staircase." We may presume it was one of the *lambs;* but it has been already remarked, with justice, that a *lion* would have been more suitable for so exposed a situation.

The great ecclesiastical antiquary of England died in 1760; and we conclude all this gossip about him with a set of verses written upon him by Dr Darrell of Lellington Darrell, to the tune of *Chevy Chase*:—

"Whilom there dwelt near Buckingham,
That famous county town,
At a known place, hight Whaddon Chace,
A 'squire of odd renown.

A Druid's sacred form he bore,
His robes a girdle bound;
Deep versed he was in ancient lore,
In customs old, profound.

A stick, torn from that hallow'd tree
Where Chaucer used to sit
And tell his tales with leering glee,
Supports his tottering feet.

High on a hill his mansion stood,
But gloomy dark within;
Here mangled books, as bones and blood
Lie in a giant's den.

Crude, undigested, half-devour'd,
On groaning shelves they're thrown;
Such manuscripts no eye could read,
Nor hand write, but his own.

No prophet he, like Sidrophel,
Could future times explore;
But what had happen'd, he could tell,
Five hundred years and more.

A walking alm'nack he appears,
Stepp'd from some mouldy wall,
Worn out of use through dust and years,
Like scutcheons in his hall.

His boots were made of that cow's hide
By Guy of Warwick slain;
Time's choicest gifts, aye to abide
Among the chosen train.

Who first received the precious boon,
We're at a loss to learn,
By Spelman, Camden, Dugdale worn,
And then they came to Hearne.

Hearne strutted in them for a while;
And then, as lawful heir,
Browne claim'd and seized the precious spoil,
The spoil of many a year.

His car himself he did provide,
To stand in double stead;
That it should carry him alive,
And bury him when dead.

By rusty coins old kings he'd trace,
And know their air and mien;
King Alfred he knew well by face,
Though George he ne'er had seen.

This wight th' outside of churches loved
Almost unto a sin;
Spires Gothic of more use he proved
Than pulpits are within.

Of use, no doubt, when high in air,
A wandering bird they'll rest,
Or with a Brahmin's holy care,
Make lodgments for its nest.

Ye jackdaws, that are used to talk
Like us of human race,
When nigh you see Browne Willis walk,
Loud chatter forth his praise.

Whene'er the fatal day shall come,
For come, alas! it must,
When this good squire must stay at home,
And turn to antique dust;

The solemn dirge, ye owls, prepare,
Ye bats more hoarsely screek;
Croak, all ye ravens, round the bier,
And all ye church-mice squeak!"

A SKETCH OF PEKIN.

Of Pekin, the capital of the Chinese empire, and which, from the progress of events, will at no distant day be an object of considerable attention, the following sketch, handed to us by a friend, has been written by a late Russian traveller. It is necessary to premise, that the situation of Pekin is near 40 degrees north, and therefore somewhat cold in winter.

"During the first few days of our residence in the cold dwelling-houses of Pekin, we felt the discomforts of our European dresses very severely, and made, therefore, all haste to exchange them for Chinese habiliments. The divisions and subdivisions which exist in a Chinese wardrobe are innumerable. Each change of season brings necessarily along with it a change of costume; and these variations, fixed by custom, are as sacredly observed by correct Chinese as the laws of fashion by European ladies and leaders of *ton;* with only this difference, that here 'the mode' has no influence, and the cut of the father's and grandfather's clothes is quite visible in those of the son and grandson—nay, it may pass even to the great-great-grandson. In the shape of caps and shoes alone, an almost yearly change takes place. Do not, however, suppose that it is any exercise of choice whether with the alteration of the season you may change your dress or not—by no means; the appointed time arrives, and an imperial edict announces that, on such a day, spring-caps must be exchanged for summer ones, or summer caps for autumn ones. I therefore arrayed myself like a genuine Chinaman.

The first part of my stay was very tedious; picture to yourself a man plunged at once into so populous a city, into the midst of a swarm of people, whose manners, customs, and mode of life, were quite strange, and whose language was utterly incomprehensible to him, and you will be able to understand my position. Was I thus alone, in the midst of this multitude of people, to pass ten of the best years of my life? Our chief drawback lay in the excessively difficult Chinese pronunciation, where one and the same sound, however simple, has its own peculiar meaning, according as it is pronounced in a high or low, in an abrupt or prolonged, tone of voice. For the first half year we scarcely made any progress whatever; at the end of two years only did we begin to find our way into the secrets of that labyrinth called the Chinese tongue, and fully four had elapsed before we were able to converse freely with the natives.

As soon as we were clothed in complete Chinese costume, being very desirous to see Pekin, we hired cabriolets and drove through the streets of the capital. First we drove to the imperial palace, where the emperor passes the winter months; during the whole of the rest of the year he resides in a palace about nine miles distant from the city. The palace occupies an immense space, consisting of a multitude of one-storey houses built of bricks, each of which has its appointed use. The emperor resides in one of them, in another he conducts the affairs of state, and in a third is the empress. The others are appropriated for his children, the widowed empress, the ladies of the court, &c. Each division is surrounded by a tolerably high wall, which none may pass except those persons belonging to it. All these buildings are again surrounded with a general wall, the threshold of whose gate may only be passed by the courtiers. An enclosure surrounds this outer wall, where there are many private shops, and where every body is allowed to walk or drive. The palaces themselves we could not see, and only the yellow roofs of glazed tiles showed themselves above the wall. Neither those streets in the vicinity of the palace, nor any throughout the city of Pekin, are paved.

Without having in the least satisfied our curiosity, we drove from the palace through the street Sy-oi-lou, which, like all the other principal streets, is distinguished for breadth and regularity. The middle of each chief street of Pekin consists of an embankment of earth raised about three feet above the rest of the street, for the use of light carriages and foot passengers. Heavy loads, or carriages drawn by five and seven mules, must drive along the narrow avenues on each side of the embankment, which is a good width, and would be very convenient for driving upon, were it not that there are tents and booths erected at each side, which confine it so much that two carriages can scarcely drive abreast. In consequence of the excessive population of Pekin, the streets are filled throughout the whole day with a double row of carriages, slowly progressing in opposite directions. It is a terrible annoyance when a foot passenger happens to meet a friend who is driving. The latter, according to the strict etiquette of Chinese politeness, must stop, alight, and, in spite of weather or dirt, say, "How do you do?" and then invite his friend to accept a seat in the carriage. Of course the pedestrian must reply to this civility, and beg his acquaintance to proceed on his way. The owner of the carriage will not, however, re-enter it until his friend on foot shall proceed; he in his turn will wait till the other resume his seat. The ceremony will often occupy half an hour; and during the whole time the carriages which follow must wait, there being no possibility of passing the one stopping up the way.

The main streets are of a good width, but the side ones are so very narrow that two carriages meeting could not possibly pass, so that the coachman must always call out on entering one to ascertain whether any other vehicle is coming in the opposite direction. Every side-street had formerly a gate wherever it crossed either another cross or a main street, and many of them still remain. These gates were formerly closed at night by warders, who lived in the vicinity, and the passenger required a particular permission in order to pass it by night; now, however, this extreme strictness has ceased; the warder merely questions the nightly passenger, and even this occurs rarely. Owing to the custom of the Chinese of surrounding themselves with high walls, the streets of Pekin are most remarkably uniform. On every side rise high enclosing walls, built of half-burnt grey bricks; everywhere peep up from behind these walls pointed sloping roofs, which in form and colour are again monotonous. The imperial palace alone is covered with glazed green tiles, all the other dwelling-houses with the half-burnt grey-coloured ones. Besides the emperor's, there are not more than seven or eight princely palaces. All the rest weary the gaze by their dust colour; and the eye can rest on nothing which does not display the most tedious uniformity, unless it be the shops, which generally project into the streets. Before the entrance of all these booths hang black polished boards, inscribed with thick golden letters; there is not, however, any difference betwixt them, and only those where confections are sold are distinguished by their splendour. The whole of the front wall of these is gilt, even to the roof, and adorned with dragons and other figures. The magnificence of these shops is the more striking, as close beside them one may often find a half-destroyed wall or a little tottering dwelling-house. There are no open places or gardens in Pekin; and the only remarkable buildings are the temples, which are profusely painted with vermilion colour.

It is a great mistake to accuse the Chinese of bigotry. Their temples are generally quite empty: here and there only, an official who has received a new, and, be it understood, a *profitable*, appointment, considers it his duty to visit all the temples in the city. On such an occasion he conducts himself as follows:—On entering, he takes with him a bundle of candles, made from the bark of a tree, and of perfumed wood; these he lights before the images of the gods, prostrating himself several times to the ground, during which time the priest strikes a metal saucer with a wooden mallet. Such a pilgrim having concluded his prayer, throws down some money, and proceeds into the second temple, thence into the third, and so on. Even the common people go only on particular occasions to the temple; when, for instance, a time of great drought arrives, troops of peasants assemble in the temple, in order to pray to their god for rain; and not only light candles and make prostrations, but bring also offerings with them, consisting of different sorts of bread, &c. Of a sincere disinterested prayer, offered from the heart of the suppliant, the Chinese worshipper has no conception. There are, to be sure, certain days every month when the temple is visited by the people, but then it is not with the intention of prayer but of business. Goods, such as millinery, for instance, are spread out in the courts of the temple; and the visiters promenade from noon till evening amongst rows of sellers, who at these fairs generally demand the most unreasonable prices. For a *nephrit*, for instance, a stone of a grass-green colour, which is particularly esteemed by the Chinese, and which is used for rings, snuff-boxes, armlets, and such like, a salesman demanded 250 lan, and he gave it me for 26! (A lan is about four florins, or 6s. 8d. English.) Jugglers, also, display their tricks here; one will go on his hands, another throw knives; and so forth.

Towards evening the court of the temple becomes empty, and all is again silent until the following fair, with the exception of the priests going thrice a-day to burn a small candle before each of the great images of the gods, and prostrating themselves each time to the earth. When the priest does not feel inclined to fulfil this heavy duty himself (and he rarely feels such a desire), he sends his pupil to light the candles and make prostrations; but if he does not just happen to be at hand, a common servant does it. As for the rest, the candles are lighted at the proper times, the prostrations are made as low as possible, and what more can one require? If the temples, however, are almost always empty, the houses of public entertainment, on the contrary, are filled with people from morning till night. In the best inns, one pays a high price for every trifle; so that when two or three of the rich young Chinese meet there, they easily spend in an evening 50 lan. The high price is not, however, a consequence of the extreme dearness of the articles required, but of the vanity of the consumer. In general, money is here lightly regarded; every darling son of the heaven-protected city of Pekin throws down his

purse almost uncounted. They eat all manner of expensive things, such as *roasted ice*, for instance, for a little plate of which one pays 6 lan; it is prepared as follows:—The cook puts a small bit of ice on a sieve made of little wands or sticks, into a rather liquid batter of sugar, eggs, and spices, and then plunges it quickly into a pan of boiling swine's fat. The skill of the cook is shown by his bringing the dish upon the table before the ice be melted in the batter. A particularly good morsel cannot be expected, for when put into the mouth it burns, and when bitten into it is very cold. The high price of this dish arises from so few cooks being able to make it exactly as it ought to be. Taken in general, the Chinese dishes are very disagreeable to Europeans; for they prepare every thing without salt, and, in addition, float it in a superfluity of swine fat; and few dishes are made without ginger and garlic. Their roasts only are well flavoured, and might receive the highest approbation from a European gastronome.

The reason of there being such an extraordinary number of eating-houses in Pekin, is the custom the Chinese have of entertaining one another, not in their own homes, but in these establishments; relations only and the most intimate acquaintances being ever invited to dinner or supper into their houses. The youth also assemble in the eating-houses, and the seniors dine there after the theatre, for the theatre and dinner at a restaurant are amusements which are inseparably connected with each other. Theatrical representations commence at eleven in the forenoon, and continue till six in the evening. In the course of the play, beautiful boys, who play the women's parts, come into the boxes of the rich members of the audience, and appoint an eating-house, where they promise to come and sup with them. During supper, these boys choose the dishes, and usually ask for the most expensive, having previously agreed with the master of the house upon a reward for so doing. All these boys are richly and tastefully dressed, skilled in conversation, lively, and witty. Neither in the theatres, the eating-houses, nor in the temple at fair times, are women to be seen, but on the streets one meets with plenty. Women of the lower rank go on foot, but those who are at all well off drive in cabriolets. The wives and daughters of princes, on the other hand, are carried in sedans. Married as well as unmarried women appear in the street with unveiled faces, and simply arranged hair, which they adorn with beautiful artificial flowers. Even the most ragged, dirty, old cook, if she is only going to the door to buy a little garlic or cabbage, has always a flower, usually red, stuck amongst her grey locks. The dress of the ladies is chiefly distinguished by bright colours: that of the Mandschurin ladies consists chiefly in a long upper robe with immense sleeves. This dress quite conceals the shape; but the Chinese do not distress themselves on account of this disadvantage, as they seek for feminine slenderness in narrow shoulders and a flattened chest, on which account their women all bind a broad girdle over the bosom, which supplies the place of the European corsets. The dress of the true Chinese women consists of red or green trousers, which are embroidered with many-coloured silks—of jackets, also embroidered—with a very richly embroidered upper garment.

The Chinese women are chiefly distinguished from the Mandschurins by their feet; these do not spoil their feet by tight bandages, and wear slippers like the men, only their stockings are made of gay-coloured stuffs, with foot soles not less than four inches thick. The Chinese women, on the contrary, bind their feet from five years of age with broad bandages, in such a way that four toes are bent under, and the great toe laid over them; the nails press into the flesh, causing almost always wounds, and the unfortunate females suffer during their whole lives from this barbarous custom. Not one of them can stand on the whole foot, and they all walk on their heels, on which account their walk is most unsightly, and they totter from side to side. Considerable ostentation prevails when a Chinese or Mandschurin lady goes abroad: an out-rider first appears, behind him comes a two-wheeled carriage drawn by a mule, the head and sides of which are hung with green or blue cloth, into the sides of which are set in pieces of black velvet and glass; on the right and left walk two men, holding the carriage with their hands, in order to prevent its falling over at any of the inequalities of the road, and behind the carriage comes another rider. As one must step into and out of the carriage in front, the coachman has to unharness his mule every time; the men who walk outside the carriage then turn it close up to the stairs, let the shafts down on the steps, and immediately turn their backs to the equipage, for, according to Chinese etiquette, they may not look their mistress in the face. The waiting-maid, who generally sits in front, first steps out, adjusts a little footstool, and helps her lady to alight. On departing, the ceremony is repeated—that is, the lady and her maid first resume their seats, then the coachman harnesses his mule, and the cortège proceeds in its former order. The men display magnificence, when they drive abroad, by the numbers of their followers, who often amount to twenty or more. But what followers! two or three are well dressed, but the rest are ragged and mounted on lame and worn-out mules. Pride, however, never allows a Chinaman to lessen the number of his attendants, although the keeping of these idle bands must be very expensive. The stir in the streets commences at break of day—that is, in summer at four, and in winter at six o'clock. The men in office first make their appearance going to the palace with public papers, and then the small dealers with eatables. The noise and bustle are continually on the increase; by seven all the streets are crowded with innumerable masses of people; and at nine or ten at night they retire to rest. At this hour the most perfect silence reigns through the empty streets, and here and there only glimmers the dim light of the paper lanterns, which are fixed on low pillars."

THE BABES IN THE WOODS.

[We copy the following from a late number of the *Nova Scotian*, a newspaper published at Halifax, in Nova Scotia, where the incident alluded to appears to have caused a sensation creditable to the feelings of the inhabitants.]

Most children who can read, have read the touching little nursery tale of "The Babes in the Woods," and thousands who cannot read have wept over it as better-informed playmates, nurses, or grandmothers, poured it into their infant ears, with various embellishments and exaggerations, which, if all duly preserved, would fill a book as large as "Robinson Crusoe." The incident which we have now to relate, shows that the main features of this tender legend have not been overdrawn, and are, in reality, true to nature.

The town of Dartmouth lies on the eastern side of Halifax harbour, directly opposite to the city of that name. The township of Preston lies to the eastward of Dartmouth, and embraces scattered agricultural settlements, through the principal of which the main road runs which leads from Dartmouth to Porter's Lake, Chezetcook, Jedore, and all the harbours upon the south-eastern sea-board. About half a mile from this road, at a distance of some four miles and a half from the ferry, lived John Meagher, a native of Ireland, his wife, and a family of four children. His house is prettily situated on an upland ridge, between two lakes, and overlooking the main road. His cleared fields were chiefly in front, the rear of his lot being covered by a thick growth of bushes and young trees, which had sprung up in the place of the original forest, long since levelled by the axe or overrun by fire. Behind the lot, in a northerly direction, lay a wide extent of timber and scrambling woodland, barren granite and morass, the only houses in the neighbourhood lying east or west, on ridges running parallel with that on which Meagher lived, and which are separated from it by the lakes that extend some distance in rear of his clearing.

On Monday morning, the 10th day of April, Meagher, his wife, and two of the children, being sick with the measles, the two eldest girls strolled into the woods to search for *lashong*, the gum of the black spruce tree, or tea berries. Their names were Jane Elizabeth and Margaret, the first being six years and ten months old, and the latter only five years. The day was fine, and the girls being in the habit of roaming about the lot, were not missed till late in the day. A man-servant was sent in search of them, and thought he heard their voices, but returned without them, probably thinking there was no great occasion for alarm, and that they would by and by return of their own accord. Towards evening the family became seriously alarmed, and the sick father roused himself to search for his children, and gave the alarm to some of his nearest neighbours. The rest of the night was spent in beating about the woods in rear of the clearing, but to no purpose, nobody supposing that girls so small could have strayed more than a mile or two from the house. On Tuesday morning, tidings having reached Dartmouth, Halifax, and the neighbouring settlements, several hundreds of persons promptly repaired to the vicinity of Meagher's house, and, dividing into different parties, commenced a formal and active examination of the woods. In the course of the day, the tracks of little feet were discovered in several places on patches of snow, but were again lost; the spot at which the children crossed a rivulet which connects Lake Loon with Lake Charles was also remarked. A coloured boy, named Brown, whose dwelling lay about three miles to the north-west of Meagher's, also reported that he had heard a noise as of children crying the evening before, while cutting wood, but that, on advancing towards it and calling out, the sound ceased, and he returned home, thinking it was perhaps a bird or some wild animal.

The tracks, the coloured boy's report, and the subsequent discovery of a piece of one of the children's aprons stained with blood, at the distance of three miles from their home, gave a wider range to the searches of the benevolent, who began to muster in the neighbourhood of the place in which the piece of apron was picked up, and to deploy in all directions, embracing a circle of several miles beyond and in rear of it. Monday night was mild, and it was pretty evident the children survived it. Tuesday night was colder; and about two inches of snow having fallen, the general conviction appeared to be, that, worn out with fatigue and hunger, and having no outer clothing, they must have perished. Still, there was no relaxation of the exertions of the enterprising and benevolent. Fresh parties poured into the woods each day; and many persons, overpowered by the strength of their feelings, and gathering fresh energy from the pursuit, devoted the entire week to the generous purpose of rescuing the dead bodies, if not the lives of the innocents, from the wilderness. Wednesday, Thursday, Friday, and Saturday, passed away, and no farther trace was discovered of the babes in the woods; every newspaper that appeared was eagerly searched for some tidings; every boat that crossed the harbour was met by anxious and inquiring faces; Dartmouth was the centre of excitement, and the Preston road was constantly occupied with vehicles and pedestrians moving to and fro.

As the week closed, all hopes of finding the children alive were of course abandoned, and yet nobody thought of discontinuing the search. An air of mystery began to gather about the affair. The accounts of the man-servant and of the coloured lad were eagerly canvassed. What meant the blood upon the scrap of the apron? Had there been crime? Had wild animals destroyed them? How could hundreds of persons have traversed the woods for five days without finding them? All these were questions which every body put to his neighbour, and which none could answer.

On Sunday morning it was quite evident that the interest had rather deepened than declined. A load seemed to hang upon the mind, which was excessively painful. Many who had been confined all the week, unable to join in the good work, determined to spend the Sabbath in searching for the children, in imitation of Him who went about doing good, and who gave examples of active benevolence even on the day set apart for rest and devotion. Many others thought to throw off by locomotion, and a sight of the localities, the load of doubt, and mystery, and apprehension, which oppressed them. From early morning till eleven o'clock, groups might be seen entering the steamboat, with hunting coats and strong buskins, evidently bound for the woods. The Preston road was covered with the ardent and eager, of all ranks and all ages, pressing onward with a zeal and determination worthy of any good cause.

We strolled into Meagher's early in the forenoon. The sick husband was in the woods. The bereaved mother, whose agony must have been intense throughout the week, while there was a chance of her little ones being restored to her alive, seemed to have settled into the sobriety of grief which generally follows the stroke of death, and when hope has been entirely extinguished. One sick child rested on her lap. Friendly neighbours were sitting around, vainly essaying to comfort her who could "not be comforted," because her children "were not." All they could do was to show, by kind looks and little household attentions, how anxious they were to prove that they felt her bereavement keenly. We plunged into the woods, and at once saw how easy it might be for children to lose themselves in the dense thickets and broken ground immediately in the rear of the house, and how exceedingly difficult it might be to find their bodies, had they crept for shelter into any of the fir or alder clumps, through hundreds of which they must have passed, or laid down beneath the spreading roots of any of the numerous windfalls which lay scattered on either hand. We wandered on and on, occasionally exchanging greetings or inquiries with parties crossing or recrossing our line of march. As we proceeded, clambering over windfalls, bruising our feet against granite rocks, or plunging into mud holes, the sufferings of these poor babes were brought fearfully home to us, as they must have been to hundreds on that day. If we, who had slept soundly the night before—were well clad, and had had a comfortable breakfast, were weary with a few hours' tramp—if we chafed when we stumbled, when the green boughs dashed in our faces, or when we slumped through the half-frozen morass—what must have been the sufferings of these poor girls, so young, so helpless, with broken shoes, no coverings to their heads or hands, and no thicker garments to shield them from the blast, or keep out the frost and snow, than the ordinary dress with which they sat by the fire or strolled abroad in the sunshine? Our hearts sunk at the very idea of what must have been their sufferings. We were pushing on, peering about, and dwelling on every probability of the case, when, just as we struck a wood-path, we met a lad coming out, who told us that the children were found, and that they were to be left on the spot until parties could be gathered in, that those who had spent the forenoon in search should have the melancholy gratification of beholding them as they sunk into their final rest on the bleak mountain side.

In a few moments after, we met others rushing from the woods, with the painful and yet satisfactory intelligence, hurrying to spread it far and wide. We soon after hove in sight of Mount Major, a huge granite hill, about six miles from Meagher's house, and caught a sight of a group of persons standing upon its topmost ridge, firing guns, and waving a white flag as a signal of success. The melancholy interest and keen excitement of the next half hour we shall never forget. As we pressed up the hill side, dozens of our friends and acquaintance were ascending from different points—some, having satisfied their curiosity, were returning, with sad faces, and not a few with tears in their eyes. As we mastered the acclivity, we saw a group gathered round in a circle, about half way down on the other side. This seemed to be the point of attraction. New comers were momently pressing into the ring, and others rushing out of it, overpowered by strong emotion. When we pressed into the circle, the two little girls were lying just as they were when first discovered by Mr Currie's dog. The father had lifted the bodies, to press them, cold and lifeless, to his bosom; but they had been again stretched on the heath, and their limbs disposed so as to show the manner of their death. A more piteous sight we never beheld. Jane Elizabeth and Margaret Meagher were the children of poor parents, and they wore the common dress of their class, and scanty enough it seemed for the perils they had passed through. The youngest child had evidently died in sleep, or her spirit had passed as gently as though the wing of the angel of death had seemed but the ordinary clouds of night overpowering the senses. Her little cheek rested upon that of her sister—her little hand was clasped in hers—her fair, almost white hair, unkemped and dishevelled, strewed the wild heath upon which they lay. The elder girl appeared to have suffered more. Her eyes were open, as though she had watched till the last; her features were pinched and anxious, as if years of care and anguish had been crowded into those two days. If life is to be measured by what we bear, and do, and suffer, and not by moments and hours, that poor girl must have lived more in two days than some people do in twenty years.

We pity the man who could have stood over them for an instant without shedding a tear for their fate and for their sufferings. There were few who did. We looked round us as we broke from the circle: there were men

of all ranks and ages; soldiers in fatigue dress—the merchant, the mechanic, and the professional man, with the town garb variously disguised—the Preston, Lawrence Town, and Cole Harbour farmers, in their homespun suits—the Chizetcook Frenchman in his mocassins—the coloured man in his motley garb—and, apart from the rest, a group of Indians, sharing the common feelings and sentiments of our nature, but calm and unruffled amidst the general excitement of the scene.

The hill on which the children were found was the last place anybody would have thought of looking for them; and yet when upon it, the reason of their being there seemed sufficiently clear. A smooth platform of rock, clear of underbrush, and looking like a road, approaches the base of the hill, from the direction in which the children probably came. They doubtless ascended in order that they might ascertain where they were; and it is more than likely that when they saw nothing but forest, bog, and wild barren, stretching for miles around them, without a house or clearing in sight, their little hearts sunk within them, and they laid themselves down to refresh for farther efforts, or, it may have been, in utter despair, to cling to each other's bosoms and die.

There was one thing which brightened the scene, sad as it was, and seemed to give pleasure even to those who were most affected by it—"in death they were not divided." It was clear that there had been no desertion—no shrinking, on the part of the elder girl, from the claims of a being even more helpless than herself. If she had drawn her sister into the forest, as a companion in the sports of childhood, she had continued by her in scenes of trial and adversity that might have appalled the stoutest nature, and broken the bonds of the best-cemented friendship. Men, and women too, have been selfish in extremities, but this little girl clung to her sister with a constancy and fidelity worthy of all praise. From the tracks, it was evident that she had led her by the hand, changing sides occasionally as the little one's arm was weary. The bodies have been buried in a rural and quiet little grave-yard, about two miles from Dartmouth.

SCHOOLS IN ATHENS.

It is very gratifying to learn that the educational labours of the worthy Americans, Mr and Mrs Hill, whose schools in Athens have been already alluded to in this Journal, are still carried on in that restored city with undiminished zeal and success. Mr Garston, a late tourist, thus speaks of them. "In company with one or two other Englishmen, I have been admitted into the schools which are under the direction of the Rev. Mr Hill and his lady. The public establishment, in which children are educated without charge, is supported by funds supplied by the American Missionary Society, augmented by the voluntary contributions of European Philhellenes. It affords the means of gratuitous instruction to about five hundred children of the poorer classes. The private establishment is devoted to the education of the children of persons in the higher walks of life who can pay for their instruction, and to that of children who are brought up at the charge of the government. Of these classes there are about one hundred and twenty, nearly two-thirds of whom are resident in the house, under the immediate care of the amiable directress of the institution. The school-rooms of the private establishment exhibited a series of gratifying and beautiful pictures of infantine life. The pupils are for the most part very young girls, distinguished, with few exceptions, by an air of extreme intelligence and vivacity, and in many instances by countenances of singular delicacy and beauty. When we were admitted into the rooms, they were pursuing their studies in classes, and it was evident that their occupations were regarded by them rather as an enjoyment than as a task—a pledge, I should think, of future proficiency on the part of the students. Having observed that several very young damsels had produced drawings of considerable merit, as also that the musical pupils were less numerous, and apparently less advanced in their studies, although under the guidance of an accomplished musician, I was tempted to inquire whether this difference arose from a preference accorded to the former study by the parents, or from a peculiar taste for it on the part of the pupils, and was informed in reply that, among the latter, a decided talent for design is of frequent occurrence, whilst a taste or talent for music is comparatively rare. Mrs Hill numbers among her pupils the daughters of many of the first Greek families of Constantinople, as well as of the most distinguished of Greece Proper. The names of Kriezis, Mavrocordato, Grivas, &c., fall oddly but pleasingly on the ear in this scene of youthful loveliness and simplicity. The impression which remains with the visiter who has the gratification of seeing Mrs Hill in the midst of her flock is, that she possesses that 'jewel beyond all price' to the instructress of youth—the talent of winning the heart, while she forms the mind. Madame Tricoupi, who is well acquainted with such part of the establishment as does not admit of the inspection of a male visiter, speaks of it as perfect throughout, and of its inmates as a happy family, of which Mrs Hill is the centre. The Rev. Mr Hill and his lady have since supplied the schools in Hydra with teachers, and thus may be said to be pouring the blessings of education into Greece through a variety of channels. It is gratifying to know that the youth of Greece, both male and female, display as much ardour as capacity for the acquisition of knowledge."

LABOUR A BLESSING.

A certain degree of labour and exertion seems to have been allotted us by providence as the condition of humanity. "In the sweat of thy brow shalt thou eat thy bread." This is a curse which has proved a blessing in disguise. And those favoured few who, by their rank or their riches, are exempted from all exertion, have no reason to be thankful for the privilege. It was the observation of this necessity that led the ancients to say that the gods sold us every thing, but gave us nothing. Water, however, which is one of the great necessaries of life, may in general be gratuitously procured; but it has been well observed that if bread, the other great necessary of human life, could be procured on terms equally cheap and easy, there would be much more reason to fear that men would become brutes for the want of something to do, rather than philosophers from the possession of leisure. And the facts seem to bear out the theory. In all countries where nature does the most, man does the least; and where she does but little, there we shall find the utmost acme of human exertion. Thus, Spain produces the worst farmers, and Scotland the best gardeners; the former are the spoilt children of indulgence, the latter the hardy offspring of endeavour. The copper, coal, and iron of England, inasmuch as they cost much labour to dig, and insure a still farther accumulation of it when dug, have turned out to be richer mines to us than those of Potosi and Peru. The possessors of the latter have been impoverished by their treasures, while we have been constantly enriched by our exertion. Our merchants, without being aware of it, have been the sole possessors of the philosopher's stone, for they have anticipated most of the wealth of Mexico before it arrived in Europe, by transmuting their iron and their copper into gold.—*Lacon.*

WAR.

Voltaire thus expresses himself on the subject of war:—"A hundred thousand mad animals, whose heads are covered with hats, advance to kill or to be killed by the like number of their fellow mortals covered with turbans. By this strange procedure they want, at best, to decide whether a tract of land to which none of them lays any claim shall belong to a certain man whom they call sultan, or to another whom they call czar, neither of whom ever saw or will see the spot so furiously contended for; and very few of those creatures who thus mutually butcher each other ever beheld the animal for whom they cut each other's throats! From time immemorial this has been the way of mankind almost over all the earth. What an excess of madness is this! and how deservedly might a Superior Being crush to atoms this earthly ball, the bloody nest of such ridiculous murderers!"

AN INSOLVENT'S PLEA.

In the Insolvent Debtor's Court, a few months ago, a person named William Charles Empson came up to be heard on his petition. His schedule contained a statement that appeared to astonish the court. It was—"I attribute my insolvency to an error of judgment of the late Lord Chancellor Eldon." In answer to the inquiries of the court respecting this extraordinary statement, the insolvent entered into a long detail of the particulars of a claim he had on the estate of a bankrupt, which had been the subject of a chancery suit; and Lord Eldon, after much consideration, having still some doubts, directed an issue to the Court of King's Bench, where he obtained a verdict; but the estate being entirely exhausted, he never received any benefit, and having his costs to pay, was utterly ruined by the cause he had gained. The insolvent was declared entitled to his discharge, but was ordered to amend his schedule, that the imputation it contained against Lord Eldon's judgment might not remain on record.—*Flowers of Anecdote.*

THE QUACK—A HINT FOR JOHN BULL.

A STORY is told of a travelling quack or mountebank, who exhibited on a stage at Hammersmith, in the reign of King George I. Having collected an audience, he addressed them in the following words:—

"Being originally a native of this place, I have, for a long time, been considering in what manner I can best show my regard for my brother townsmen; and after maturely weighing the subject, I am come to a resolution of making a present of five shillings to every inhabitant of the parish. It will, I own, be a heavy expense, and I hope no one will attempt to profit from my liberality who is not really and truly a parishioner."

The multitude pressed forward, with open eyes as well as mouths, casting earnest looks on a green velvet bag, of ample dimensions, which hung on the arm of this generous man.

"I know you are not so sordid and so mercenary," continued the orator, "as to value my bounty merely because it would put a few shillings into your pockets; the pleasure I see sparkling in your eyes cannot be produced at the thought of dirty pelf, which to-day is in your hands, and to-morrow may be in the gripe of a miser, a highwayman, or a pawnbroker.

I perceive what it is that delights you: the discovering in one whom you considered as a stranger, the warmest and most disinterested friend you ever had in your lives. Money, my good people, too often tempts the young and the indiscreet to indulge in liquor and other excesses, to the destruction of their health and morals. In order, therefore, to prevent what I meant for benefit being converted into an injury, I freely present to every brother townsman (dipping his hand into the velvet bag) this inestimable packet, which contains a box of pills, a paper of powders, and a plaster which has not its fellow in Europe for violent bruises and green wounds, whether by knife, sword, or pistol; if applied on the patient's going to bed, I pledge my reputation that the ball, if there is one, shall be extracted, and the flesh be as sound as the palm of my hand before morning.

But for those who dislike the pain and smart of such things as plasters and ointment, and who are not fond of trouble, let me recommend the powder: it acts, ladies and gentlemen, by sympathy, and was the joint invention of three of the greatest medical men that ever lived—Galen, Hippocrates, and Paracelsus. If you have a few grains only of this powder in your possession, you may without fear rush into the thickest of the battle, and defy broad-sword, pike, or bayonet. All I say is, get wounded, get crippled, get mangled and hacked like a crimped cod; the longer, the deeper, the more numerous the cuts are, the better shall I be pleased, the more decisive is the proof it will afford of the merits of my powder. Give yourself no sort of uneasiness, only wrap the part affected in a clean white handkerchief, then get to bed and to sleep as soon as you can, desiring, in the meantime, the weapon which did the injury to be well rubbed, nine times, with a small quantity of the powder, and, take my word for it, you may follow your usual occupations the next day.

Of the pills I need say nothing; they have long pronounced their own panegyric, and there are full directions sealed up with them; but as you live rather out of the way of the great world, it is but fair to tell you that they procure husbands for single women, and children for those who are married; they are great sweeteners of the blood, and wonderful improvers of the complexion.

The selling price for these matchless remedies," said the doctor, "has been six shillings for time immemorial; but as I am resolved to stand to my word, and as I do not practise physic for the love of dirty lucre, if you will throw up your handkerchiefs, with the small sum of one shilling tied in each, merely to pay travelling charges and servants' wages, I freely make you a present of the rest of the money, according to my original promise."

A small number of the crowd, who were so absurd as to doubt any thing the doctor said, marched off in silence, but the mass were not formed of materials capable of resisting so complicated an attack on their feelings and understandings; the present of a crown to each man at first so confidently promised, had dissipated all fear of imposition, for how could one who acted so much like a gentleman be supposed to want to take them in? His ostentatious harangue had diffused a magic ray over his powder of paste, his rosin, and his jalap; for the passive infatuation of being cheated is not without its pleasures.

He was proceeding in his address, but a shower of shillings interrupted his harangue, and two hours were fully occupied in easing his brother townsmen of their shillings, and emptying the green velvet bag of the six-shilling packets; while his assistants diverted the anxieties and allayed the impatience of the people by music and tumbling.

Handkerchiefs from all quarters dropped round the cunning knave; inhabitants of Brentford or Kensington, Chelsea, Turnham, or any other green, were permitted to contribute their shillings without any ill-natured questions being asked concerning the place of their residence; the business of the day concluded with general satisfaction; and the artist owned, at an inn in the evening, over a duck and green peas, that the neat profit of his afternoon was five-and-twenty guineas.—*Lounger's Commonplace Book.*

PRACTICAL MATHEMATICS.

AWARE of the great importance of a study of Mathematics, both Theoretical and Practical, in a regular course of Education, MESSRS CHAMBERS have endeavoured to procure the composition of the best possible treatises on the subject for their EDUCATIONAL COURSE. Aided by Mr A. BELL, formerly mathematical master in Dollar Institution, and one of the most profound mathematicians in Scotland, they have already issued—1st, Euclid's Elements of Plane Geometry (improved), which may be taken as the basis of the science; 2d, Solid and Spherical Geometry; 3d, Algebra, in its Various Branches; and have now published, 4th, A Treatise of Practical Mathematics. This latter work, which is indispensable to Mechanics, Civil Engineers, Mariners, and various other professional persons, is in Two Parts, embracing—Practical Geometry; Trigonometry; Mensuration of Heights, Distances, Surfaces, and Solids; Barometric Measurement of Heights; Land Surveying; Gauging; Projectiles; Fortification; Astronomy; Navigation; and other subjects. Being anxious that the works should fall within the reach of persons in the humbler ranks of society, MESSRS CHAMBERS have issued them, like other books in the series, at an exceedingly small price, considering their size and the expense incurred in their production.

The following is the list of works now issued in the series of CHAMBERS'S EDUCATIONAL COURSE, all being designed for use in schools, and neatly and strongly bound in coloured cloth:—

Infant Treatment Under Two Years of Age,	1s. 3d.
Infant Education From Two to Six Years of Age,	2s. 0d.
First Book of Reading,	0s. 1½d.
Second Book of Reading,	0s. 3d.
Simple Lessons in Reading,	0s. 10d.
Rudiments of Knowledge,	0s. 10d.
Introduction to the Sciences,	1s. 0d.
The Moral Class-Book,	1s. 6d.
A Geographical Primer,	0s. 8d.
Text-Book of Geography for England,	0s. 10d.
Introduction to English Composition,	0s. 6d.
English Grammar, Part I.,	1s. 6d.
First Book of Drawing,	1s. 6d.
Second Book of Drawing,	1s. 6d.
Animal Physiology,	1s. 9d.
Rudiments of Zoology,	4s. 0d.
Rudiments of Chemistry, by Dr D. B. Reid—a new and greatly improved edition,	2s. 3d.
Natural Philosophy, First Book,	0s. 10d.
Natural Philosophy, Second Book,	0s. 10d.
Natural Philosophy, Third Book,	0s. 10d.
Elements of Plane Geometry,	2s. 6d.
Solid and Spherical Geometry,	2s. 6d.
Practical Mathematics, Two Parts, each	4s. 0d.
Elements of Algebra, Two Parts, each	2s. 6d.
History and Present State of the British Empire,	2s. 6d.
History of the English Language and Literature,	2s. 6d.
Principles of Elocution, by W. Graham,	3s. 0d.
History of Greece,	3s. 0d.
Exemplary and Instructive Biography,	2s. 9d.

To the foregoing is added a Series of SCHOOL-ROOM MAPS of a very large size—Maps of England, Ireland, Scotland, Europe, Asia, Palestine, North America, South America, Africa, and the Hemispheres, designed by JAMES FAIRBAIRN, Esq., Rector of Bathgate Academy. Each Map measures 5 feet 8 inches in length by 4 feet 10 inches in breadth. Price, coloured on cloth, with rollers, 14s. each; the Hemispheres (including Astronomical Diagrams), 21s.

Published by W. and R. CHAMBERS, 339 High Street, Edinburgh. *Agents*—W. S. ORR and Co., Amen Corner, London; and W. CURRY Jun. and Co., Dublin; JOHN MACLEOD, Glasgow; and sold by all Booksellers. In cases where Teachers find a difficulty in getting supplies from Booksellers, they may apply direct to MESSRS CHAMBERS or their chief Agents, as above.

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row.

Printed by Bradbury and Evans, Whitefriars.

CHAMBERS'
EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 548. SATURDAY, JULY 30, 1842. PRICE 1½d.

LANGUAGES.

THE least learned are aware that there are many languages in the world, but the actual number is probably far beyond the dreams of ordinary people. The geographer Balbi enumerates eight hundred and sixty which are entitled to be considered as distinct languages, and five thousand which may be regarded as dialects. Adelung, another modern writer on this subject, reckons up 3064 languages and dialects, existing and which have existed. Even after we have allowed either of these as the number of languages, we must acknowledge the existence of almost infinite minor diversities; for, in our own country, we see that every province has a tongue more or less peculiar, and this we may well believe to be the case throughout the world at large. It is said there are little islands lying close together in the South Sea, the inhabitants of which do not understand each other. Of the 860 distinct languages enumerated by Balbi, 53 belong to Europe, 114 to Africa, 153 to Asia, 423 to America, and 117 to Oceania, by which term he distinguishes the vast number of islands stretching between Hindostan and South America.

Looking for the cause of this immense diversity of languages no farther than immediate natural conditions, it is not difficult to come to satisfactory conclusions. Man is invested with the power of speech by means of certain organs; but the organisation of no two individuals is precisely alike. Every single human being has something peculiar to himself, and in the organs of speech as well as in every thing else. Hence, the sound of every voice is palpably different in tone, and every body pronounces some particular words in a particular manner. There are family likenesses in voices and in pronunciation, or general resemblances peculiar to all the children of one pair; and there are resemblances of a more general kind in the people of one town, or district, or country. These peculiarities spring from peculiarities of organisation precisely analogous to those peculiarities of physiognomy, figure, colour of hair, and so forth, which characterise families, and the inhabitants of districts and countries. Their direct tendency is to give rise to peculiarities of language—that is, to different words and forms of phrase for representing the same ideas; but there is also something to check this tendency. The check is found in the disposition to imitate, which causes a number of persons living in one community to follow more or less one tone of voice, one kind of pronunciation, and one form of phrase. The operation of both the tendency and the check may be studied very well in any family of young children. Each babe will be found to have some peculiarity, causing a certain tone and manner of speech, and leading it to pronounce certain words in a peculiar way; which peculiarities almost entirely give way before the influence which the conversation of its seniors in time exercises upon it. For example, in a large family which happens to be under my observation, I have found various infants at first pronounce the word *fly* in a particular way, the varieties extending to no fewer than six. With one it was *fy*, with another *ly*, with another *eye*, with another *my*, with another *ty*, and with a sixth *ky*. The pronunciation was, in each case, persisted in for a considerable time, but of course was at length obliged to give way before the influence of correct pronunciation in others. To a minute and assiduous observer of nature, there can be no doubt that such peculiarities originate in peculiarities of organisation, which make each wrong pronunciation in each case the most convenient and agreeable, if not the only one possible at that period of life. Now, it will be observed that the tendency is a thing inherent, and therefore of constant operation, while the check depends on accidental social conditions. Where these are weak, the tendency will get so much the freer scope, and the diversities will become wider and more numerous. When a society becomes close and intimate, the uniformity will be, on the contrary, great and permanent. Hence we see few changes take place in such civilised densely-peopled countries as those of Western Europe; where, also, a written literature is constantly operating to maintain a standard, at least in phraseology. But where people are few and sparse, or where single families are constantly parting off into new grounds of settlement, the principle of diversity must be comparatively powerful, and new varieties will be constantly arising. We see something of this in the progress of American colonisation.

It is well known that, although so many languages are enumerated, there are many resemblances to be observed amongst them, both as to words having nearly the same signification and as to grammatical forms. These are justly regarded as evidences that the languages in which they are found have something like a common origin, and that the people now speaking them, albeit remote from each other in country, are more or less nearly related—sprung, in short, from one root. Of late years, indeed, a new and most interesting light has been shed upon human history by the inquiries which have been made into languages. Nations far separated from each other, and between which no affinity was suspected to exist, have been shown to be connected, in consequence of the discovery of words common to both their languages. The grand fact of the original colonisation of Europe from Asia, and even some of the leading particulars of that colonisation, are inferred from the investigations of the philologist. But the most curious of all modern discoveries of this nature are certainly those relative to the structure of languages. Many of my readers have, no doubt, heard of universal grammar, that is, grammar applicable to all tongues. This was an idea very natural, when it was observed that there were nouns and verbs, voices, tenses, and so forth, in the Greek and Hebrew, in the French and German, as well as in the English. But when we became acquainted with the languages of remoter parts of the earth, we found that some of them had no such forms, and that the grammar which we have called universal is bounded by a certain geographical line, beyond which all is as different as if the people belonged to a different planet. There are at least three other forms of language-structure, all of them of a perfectly original and distinct character.

Our own form covers nearly the same parts of the earth which have been assigned to the white or Caucasian variety of mankind. It extends from India along Western Asia and into Europe, which it entirely fills; thence it pursues the line of European colonisation in America and elsewhere. The lines along which its origin is traced all point to the Sanscrit, a dead language of Upper India, containing a valuable literature. The class of languages formed upon it is therefore called the *Indo-European*. Of this family of tongues the Celtic may be presumed to be one of the oldest cadets: it was the language of the first occupants of Europe of whom we have any record. Then, another and superior race, the Gothic, speaking another variety, appear to have advanced in the same direction, gradually overpowering the Celts, and driving them into the corners of Spain, France, and Britain; sending off the Scandinavian variety of speech into the north—perhaps sending off other offshoots to the south, which became component parts of Greek and Latin—and constituting the present German, and Dutch, and partly the French and English. Next came the Sclavonic, occupying Russia, Poland, Hungary, and northern Turkey. The leading features of the Indo-European class of languages are the compounding of words to make new meanings, and the inflection or changing of beginnings and terminations to form cases, tenses, and other variations.

The second great class of languages, occupying China and other countries of Eastern Asia, is usually called the *Monosyllabic* class, because every word in them consists of only one syllable. These words may be combined, as in the English words *welcome* and *welfare*; but every syllable is significant, and therefore is itself a word. One writer says, that the syllables of the Chinese language are under three hundred in number; another, that they are above four hundred; but the number may be considered as greatly increased by differences in the tone in which they are pronounced, these differences being either four or five in number. There are none of what we would call grammatical forms in the Chinese. Tenses, moods, cases, and the like, are left to be understood by the context, or by the order in which the words are placed. In their pronunciation, they have some of those peculiarities which could only have arisen from organic peculiarities in the originators of the language: they want the consonants *b*, *d*, *r*, *v*, and *z*, and when required to sound one of our double consonants, they always put a *u* betwcen them; thus, *Christus* is with them *Kul-iss-ut-oo-suh*.

The Chinese, though they have been longer a refined people than any other known to exist, may be said to have a simple language. In some respects, it is such a speech as we should expect to find amongst a primitive savage tribe. What completes this wonder is, that the Indians of North America, who have made no advance in arts, literature, or institutions, possess a language remarkable for its richness in words and for its profoundly complicated grammatical forms. One character pervades all the original languages of America, from Greenland to Cape Horn. As a class, they have been called the *Polysynthetic*, from their combining many ideas in the form of words. They present inflections, but their most remarkable means of adding and varying sense is in a process which, for want of a better term, has been called *agglutination*. Fragments of words are taken, and, as it were, patched to each other, so as to make up a kind of short-hand sentence. For example, a Delaware woman, playing with a little dog or cat, will be heard saying to it, *Kuligatschis*, meaning "Give me your pretty little paw:" the word is made up in this manner—*K* the second personal pronoun, *uli* part of the word *wulit*, signifying pretty, *gat* part of *wichgat*, signifying a leg or paw, *schis* conveying the idea of littleness. In the same tongue we find a youth called *pilape*, compounded from the first part of *pilsit*, innocent, and the last part of *lenape*, a man. We cannot enter farther into this subject; but it seems fully ascertained that an extraordinary degree of order, method, and regularity, prevails in the language of the Red man, and that it is entirely different from the tongues of the eastern continent.

Balbi assigns 117 languages to *Oceania*, and these are all found to be connected with each other in such a way as to show one common origin. I am not aware that this class of languages is distinguished by any peculiar structure, so much as by identity of words; but they are considered as standing, in one way or another, quite apart from the other great classes. They pervade an immense extent of the world's surface, namely, from Madagascar to Easter Island, half

way across the Pacific, a distance not much less than ten thousand miles.

Philologists usually reckon as a distinct class the languages spoken from early ages in the south-western parts of Asia, of which the Hebrew and Arabic are the most conspicuous tongues; but though there is much to distinguish these languages, they do not seem to be sufficiently peculiar in grammatical structure to be entitled to rank as a distinct class. It appears more likely that they are an early offshoot of the Indo-European class. The *African* languages are understood to be sufficiently well marked to form a distinct class.

Assuming that the distinctions are here correctly stated, we arrive at the important fact, that the *fundamental* varieties of human speech are comparatively few—probably less than six; that is to say, while there are so many varieties in the words employed by various nations to represent thought, there are less than six great idiomatic formulæ, or fashions of word-and-sentence-structure. In many of the languages comprehended under each of these forms, there are words in common, besides the general grammatical resemblance; but there is no community of words between the various classes—at least it is now acknowledged that the few terms which have been traced with great effort between the Asiatic and American languages are only the result of accident. We are now called upon to remark the curious fact, that the classes of languages correspond pretty nearly with those great natural divisions of the human race which physiologists have for some time concluded upon. The Indo-European class, if we include in it the languages of South-western Asia, comprehends the whole of the Caucasian race. The Yellow people, or Mongolians, have to themselves the Monosyllabic class of tongues; the Red race have the Polysynthetic. The Oceanic class of languages is the inheritance of what has been called the Malay variety of mankind, and the African class belongs to the Negro or Ethiopic race. Thus, all are parcelled out amongst as many families of human kind, all of which are considered as marked by many essential distinctions in stature, colour, character of the hair, physiognomy, and mental endowments.

From this, some very curious and interesting deductions may be made. In the first place, language is placed amongst the organic distinctions of mankind. Hair is different, visage is different, colour is different, general mental character is different; different, also, are speech, and the forms in which thoughts are arranged for enunciation. To find this last and most remarkable distinction in connexion with others, forms no small addition to the considerations which have led to the classification of mankind into five races. It gives and takes proof to and from that hypothesis. But the researches of Prichard have settled that the five races are only varieties of mankind, or at least that there is a sufficient variety-producing power in nature to have raised up these different tribes from one original stock. Are we to suppose that the fundamental distinctions of languages are irreconcilable with this doctrine? By no means. They only make good a particular fact in the early history of our race, to which we must now advert; but before doing so, it is necessary to touch slightly on the process of language-formation.

Man has from nature a set of organs expressly and most admirably calculated for the production of speech. His mind has also—though this is a fact not capable of the same lively demonstration—a faculty for the expression of thought by outward signs, of which speech is the principal. A being so endowed, placed upon the world, would have within him the inclination to speak, and also the power of uttering sounds; but there would at first be no social agreement as to what sounds were to be held to represent various ideas. It would be for time to bring about such an agreement, when there was a sufficient number of people at once to occasion a decided need for language, and to form this said agreement. For a long time the numbers of mankind were probably few, and their faculties ill developed. The process of forming language would accordingly be slow. Out of the gabble in which their faculties would indulge, through the ordinary instinct which leads all faculties to delight in exercise, only a sound now and then would come to be recognised as appropriate to some certain object, quality, or act. The forming of words in this way, and their recognition by other parties, are things which we see almost every day. Children are constantly forming new words, which become recognised in a little circle as representatives of ideas. The vicious classes of civilised communities create cant languages for themselves. There must be a constant new-making of terms for things in the mechanical arts. A peculiar readiness of tongue in some individual creates the sound: the bystanders make it a word. A friend states that one of his children has from infancy shown a turn for making new words, which the rest constantly adopt. The inclination in this instance seems almost unconscious, and none of the rest of the family has ever exhibited a similar tendency. Such a person would probably have taken a lead in language-making in a primitive society. There is a class of words which has evidently been suggested by sounds connected with the objects they stand for. The word for *calf* in Gaelic, for instance, is an exact fac-simile of the cry of the animal. It was almost unavoidable that nearly the same word should be applied to the cuckoo in the languages of all countries where that bird exists. But this class of words is, after all, less numerous than might be expected. Nor is it necessary that it should have been numerous, if there be, as above suggested, a gift in some persons for enunciating chance-formed terms, which become applied to things. But the application of a sound or a term to a thing, quality, or act, is but a first step. Many subsequent processes are needed before a language can be made up. It is at this stage that the great diversities commence; now arise those great accidents of instinctive mental working which result in making one language monosyllabic, with every single syllable significant, and another polysynthetic, with not one single syllable significant, as already shown. To borrow some explanation on this subject—"What are called ideas, are rapid perceptions continually flitting before the mental eye. Like objects viewed through a kaleidoscope, they pass before us in ever-changing shapes, and, in endeavouring to fix them on the memory by articulate sounds, the appearance of the moment will decide the form to be given to those representative signs. The man of quick perceptions will try to retain the idea of a whole physical or moral object, or perhaps a whole group of objects, in his memory, by means of one single word: another of slower comprehension, seeing or perceiving a part only, will appropriate a word or a syllable to the expression of that part, and another and another to each of the other parts that he will successively perceive. In this manner syntactic and atactic idioms* have been respectively formed; the impulse first given has been followed, and thus languages have received various organic or grammatical characters and forms. Let us give an example: At the first formation of a language, one man, by signs or otherwise, asks another to do something; the other, anxious to express his consent at once, and conceiving the whole idea, answers, *Volo*. Another man, whose mind is slower in its operations, divides the idea, and answers in two words, *Ego volo*, or, *I will*. Another demand is made to which the first man does not agree; he answers, *Nolo*; the other says, *Ego non volo*, or, *I will not*. Applying this hypothesis to all languages, and their different forms, it will be perceived how in the beginning they were framed, and how their various structures have been more or less regular, and more or less elegant in their grammatical analogies, according to the temper and capacities of the nations that first formed them, and of the men that took the lead in that promotion, who may not always have been the most sensible of the whole band; for it is to be presumed that, in those early times, as in our own day, the affairs of men were not always directed by the ablest, but oftener perhaps by the most forward and presuming individual."†

The reader will probably have anticipated the particular fact in the early history of our race to be inferred from all this—namely, that the five great varieties or families had been originated or thrown off, dispersed and far separated, before language had proceeded beyond probably some of its simplest elements, and certainly before the rise of any of its various idiomatic forms. The physiologist could never suppose that the production of the *varieties*, nor could the philologist ever with any show of reason suppose that the formation of language, would be effected otherwise than in a considerable space of time. Thus, inquiries in these two different lines come to the same point, that the commencement of all the great leading races took place while as yet language, if it existed at all, must have been in a condition of simplicity so great that it left no trace of itself in the various tongues and idiomatic systems afterwards constructed. It has always been remarked with surprise of the civilised nations found in Mexico and Peru, that they had not the use of iron, from which it was presumed that they had parted off from the original stock in the eastern continent before that metal had been adapted to use; but here, in their language, we have evidence of their having descended from that stock while it was as yet literally in *infancy*. They probably had devised rude means of navigation, before they had formed any thing entitled to the appellation of a language; for it only could be by drifting over the intermediate seas that they reached America. The law as to diversity and uniformity, spoken of in the early part of this essay, at the same time indicates pretty clearly that, during the early ages of the world, mankind were few in numbers and widely scattered. It has been shown that, where population is dense, language inclines to uniformity; where sparse, to diversity. Now, not only are the five classes altogether various, but amongst each class there is a very great difference both as to words and grammatical forms. For example, the foundations of the Celtic, Gothic, and Sclavonic, the three great genera of the Indo-European class, could only have been laid amongst families placed widely apart, and which had brought away from the stock only a few common terms and a general tendency to one set of idiomatic forms. The varieties of these genera must also have been formed amongst a small and widely separated set of people. The colonisation of the earth may, therefore, be presumed to have generally been effected by extremely small parties, perhaps in many instances by single families. In arriving at this point, it may be remarked that we are upon the same ground to which we came in the inquiry as to the rise of nations in a late paper. It was there shown to be probable, from the law as to the production of varieties, that the origins of nations strongly distinguished in colour and feature were from single migrators of strongly marked character. The unity of these results is certainly a support to both views.

It is scarcely possible to survey this wonderful history without emotions partaking of the sublime. We are accustomed to look back to the tongues of Achaia and Latium as of great antiquity, because they really are by comparison old, and partly because they have been so long with the things that live no longer. But these languages were but small offshoots of others which had probably existed for ages before them, and still partly exist; for the Teutonic is thought to be one element of the Latin. Those tongues came into existence, were the vehicles of the finest and profoundest thoughts of uninspired man, and then, as beautiful things are doing every day, they died. And it has been the fate of many other languages which at one time flourished, thus to fade and perish, crushed down, perhaps, by some rude conquest, or overpowered by the contact of a superior people. On the other hand, some languages have had the fortune to last for thousands of years without any material change; for instance, those of China and India. It is also strange to reflect that, till comparatively a recent time, western learning knew only of a few languages, and these all of one general character as to form, and partly also as to the constituent sounds; while there were not only thousands of other languages totally unknown, but variations as to form such as no European could have ever dreamed of, as if there had been something like four other human natures upon earth besides our own. Finally, we see new chapters in the early, and as yet obscure, history of mankind, arising from the investigations of a class of inquirers altogether apart from the historical—chapters undated, or whose dates do not admit of being fixed within a thousand years, but which are yet, from their basis being in fact and science, more probable and more true than many of the chronicles of recent and familiar events.

* *Syntactic*, presenting complicated grammatical forms; *atactic*, destitute of such forms, which last is the case of the Chinese.

† American Cyclopædia, article *Languages*.

MISS PARDOE'S "HUNGARIAN CASTLE."*

MANY readers will remember that Miss Pardoe, the authoress of "The City of the Sultan," and other works of merit, gave to the public some time since the fruits of her observations during a visit to Hungary, and added largely thereby to her previous literary reputation. She has now thrown together a number of the legendary tales of the Magyars, such as could not very fittingly have been introduced into her reflective and useful account of the manners, customs, and present condition of that remarkable people. The plan which Miss Pardoe has adopted for uniting her series of traditions is not a very novel one, but it answers the purpose sufficiently well. She supposes a large party to have assembled at the castle of a Magyar noble, and, on the occurrence of weather so severe as to debar the gentlemen from hunting, to have resorted to story-telling as a mode of passing the time agreeably. Each individual is called upon to choose a theme from the history of his or her ancestors; and many thrilling narratives, largely (too largely, though almost unavoidably) mingled with the supernatural and superstitious, are the consequence of this arrangement.

One of these stories refers to the age of the early crusades, when Hungary was invaded by a powerful tribe of Mongol-Tartars from the far east, who, under their chief Cadan, and others, spread ruin through the land. The Hungarian king called on his nobles and vassals to take the field against the foe. "Amongst other chieftains, this order extended to that of Loewenstein, upon which the good knight Emmerick instantly prepared to obey the summons of his sovereign; and so efficiently and zealously was he seconded by his retainers, that, ere the lapse of many days, nothing remained for the brave soldier to do but to take a fond and affectionate farewell of his family, and sally forth to dare the issue of the coming struggle.

Until the hour of his departure came, the knight had not found time to bestow a thought upon this parting; nor was it until he saw his gallant Arab fretting in the court-yard, and flinging large flakes of foam in the air as it tossed its graceful neck, and strove to escape from the hands of the groom, that he became aware of a sinking of the heart and a sadness of the spirit, which he would willingly have shaken off, but could not.

Next to his country and his honour, the gallant Sir Emmerick loved the lady Agnes. She had been so young, so beautiful, and so innocent, when he made her his bride; she had become so excellent a wife, and so staid and queenly a matron; and she had reared his brave boys and his fair and gentle girls in such sweet peace and beautiful obedience, that the household of Loewenstein had grown into a proverb in the province. Sad indeed was the parting; for the lady Agnes well knew the half-savage and barbarous nature of the enemies against whom her lord was about to contend, and the most gloomy forebodings pressed upon her spirit.

* "The Hungarian Castle." By Miss Pardoe, author of "The City of the Sultan," &c. 3 vols. London: T. and W. Boone.

'Had one of our dear boys been only old enough to have fought beside thee, my Emmerick,' she said fondly, as she stood with her arm about his neck, and her head pillowed upon his shoulder, 'methinks I should not have grieved so much at thy departure; for the saints would have loved so fair a sight, and have protected thee for thy child's sake and for mine. But thou goest forth alone against these barbarians, and I am loath to let thee quit me.'

'Nay, madam, and my good mistress,' interposed a hoarse voice at her elbow; and turning suddenly towards it, the lady Agnes beheld at her side the stalwart and lofty form of Andrew Budiak, the castellan of Loewenstein, one of the most tried and faithful of her husband's followers, a man who, although past his prime, was still as bold in the battle-field as he was true in the castle-hall, and who had won his present post by long years of fidelity and service. Budiak was looked upon with reverence by all the household, and with trust and favour by the knight and his fair wife; while to the happy boys who grew up in beauty beneath his eye, he was at once a playmate, a protector, and a friend. 'Nay, madam, and my good mistress,' said the deep voice of the castellan, 'that may still be as it pleases my lord; for there is no need that one like he should go forth without a trusty heart at his stirrup.'" The offer of Budiak was promptly refused, but being persisted in, it was at length accepted of; and thus increased, the party set off to join the army of the Magyars. Few chieftains, as it appeared, had armed with the promptitude of Sir Emmerick; and the consequence was, that a very inefficient force of Magyars was compelled to make the attempt to check the Tartars by meeting them in the field. The issue was but what might have been anticipated, considering the hardiness and wild daring of the hostile forces.

"Never was a battle more fatal than that which made the river-tide of the Lago run red with the blood of both Hungarian and Tartar. The Tartarian troops suffered severely, and their slain cumbered the green sward; but Hungary had to weep not only her bravest but her noblest. High heads were bowed that day, and high hearts stilled for ever; there was scarcely a hearth throughout the land beside which one seat was not made vacant. Death had a rich harvest. But, alas! the evil ended not here; for they who fell were comparatively blessed; their cares were over; and when the broad sun went down after the fight, it gilded with its goodliest beams the graves of those who slept beneath them. The pale dawn rose, and the mountain vapours unwound their clammy wreaths from peak and pinnacle, as the radiant beam came on; but with the light and warmth of day came also the wild victors among the dying and the dead, to plunder those whose task was ended, and to secure the wounded, who might hereafter be ransomed.

Of the latter number were the knight of Loewenstein and his faithful Budiak, who had fought and fallen together; and who, having partially recovered consciousness, and given unequivocal signs of life, were lifted from the earth, conveyed into the Tartar camp, and assigned by lot to the chief Cadan.

A few days of rest were reluctantly ceded to them, for their wounds were numerous and severe; but their savage master had no sooner ascertained that no actual risk of their dying by the way still existed, than they were chained together, and with a score of other unfortunates, also linked two and two, and attached by the centre of their fetters to the stirrup of a Tartar horseman, bearing a long and pliant lance in his hand, a bow slung at his saddle-bow, and a quiver of arrows at his back, they were dragged or driven onward, and not unfrequently impelled by blows, towards the home of their captor."

After weary months of hope deferred, making the heart sick, the lady Agnes of Loewenstein not only heard of her misfortune, but received it in an exaggerated form. It was told to her that her husband was dead! "It were vain to attempt to depict the agony of the widowed mother, as she listened to the fatal tale. 'Dead!' she exclaimed wildly. 'What! the father of my boys? The lord of Loewenstein, who hath ever made his foemen lick the dust, and scattered terror before him as he went? It cannot be! You would mock me, because I am here alone, and that *he* is not by to comfort me'—— And then she wept, and none sought to control her tears, for they knew that without this kindly dew such grief might craze her brain; but they brought her children to her, and placed her last-born on her knee; and then they left her in her sorrow, for they felt that it was too sacred to look upon at such a moment."

Emmerick, meanwhile, was wasting his days in toil, suffering, and tears, nor could even his faithful Budiak talk to him of hope. But a gleam of light at length glanced on their gloomy state. "It chanced that one evening, overcome by exertion under a burning sun, the lord of Loewenstein and his companion sank down side by side upon their bed of leaves, within the den which had been assigned to them, when Budiak, in the act of turning away his head from his master, that he might not seem to be watching his misery, caught sight of an axe which had been accidentally left in their cell by one of the hired labourers employed in erecting sheds for the newly-arrived captives, who were so numerous as to require additional places of shelter; and without even asking himself a question as to its probable utility, or forming any plan in which it might avail, he hastily concealed it within his garments. As he did so, a new hope, strong and resistless, sprang up within him; although he could shape it into no tangible form or likeness, nor torture his invention into any scheme of deliverance which was not only too vague but even too impossible for accomplishment.

The night wore on; the watch had been set; each prisoner had answered as his name had been challenged by the captain of the guard; and the deep slumber of over-wrought strength—that sleep which is without rest, and almost without blessing—had fallen upon the miserable band, when Budiak revealed to the knight the secret of his newly-acquired treasure. Their first impulse was spontaneous; chained as they were together, all escape was impossible; but this strong instrument would sever those galling fetters, and set them free. Accordingly, with great caution, and muffling the sound of the iron links with the folds of their coarse garments, the two captives commenced their attempt; but every effort proved fruitless; the ponderous chain was too substantial to be so severed; and after they had alternately exhausted their feeble remains of strength in the vain endeavour, they desisted in despair, and as they did so, each turned aside to weep.

'It avails not,' at length exclaimed the knight; 'we are fated to die like felons, and we must submit—there is no hope—would that there were also no memory. What a curse has the past become to me! I grow old as I call it back. Budiak, I love you—I mourn for you—I cannot forget that it is for me that you are here, when you might have been free, and honoured, and happy. And what are you now?'

'Your own poor servant, my good lord,' was the reply, as the faithful follower turned painfully upon his rugged bed, and raised the hand of his chieftain to his lips, which were moistened by the blood-drops that his late struggle to rend the chain had collected on his maimed and smarting fingers: 'Your own poor servant, suffering for you and with you, and thus far happier than if he were himself the lord of Loewenstein! Would you think of *me* when the chain is rusting into your own flesh?'

'There is no hope!' ejaculated the knight.

'My honoured lord,' continued Budiak, 'despair not; nature sometimes shrinks for a time, but she redeems herself at last; I can support my own misery, for I am alone in the world; glory has been my mistress, and I have known no other; I am the child and the votary of fortune; and though the chances have now turned against me, I have no right to rebuke my fate; for, thanks to you, my brave and honoured master, I have in my time dealt far heavier blows than I have yet received. With you it is otherwise; you were born to greatness, and you have lost your birthright; but it must be redeemed.'

'Alas! there is no hope,' murmured the knight, as he buried his face in his hands.

He was aroused by the sound of a heavy blow. Not one which had fallen upon a hard and resisting substance, but which produced a crashing and smothered sound, that although he knew not why, thrilled to the very core of his heart.

'What have you done, Budiak?' he asked hurriedly.

'My lord! my benefactor!' gasped out the voice of his follower; 'there was but the accursed Tartar chain between you and freedom, and we could not burst it. It holds you here no longer; go, rejoin your wife, and be happy. Tell her'——

As he paused in agony, and raised his hand to dash the sweat-drops from his brow, the knight bent towards him to discover the secret of his terrible emotion; when with a groan of misery he sank back in his turn, exclaiming—'Tell me that I dream—I dare not—will not believe that you have done this.'

'Calm yourself, my lord, and think of flight,' replied the heroic vassal; and as he spoke, he raised himself with a violent effort, and wrenched away, from the fetter by which it had been so long encircled, the leg which he had hewn from his body in order to accomplish the escape of his master; 'let me fling off this useless limb which never served me so well as it has done this day. And now be wary, my good lord, and you are free; for our infidel captors have trusted largely to the chain, and speed and silence will almost insure success.'

'Never!' said Emmerick, as he threw his arms about the devoted man; 'I will never leave you here alone—maimed for my sake—a prey to the lash; or perhaps to die without one friendly voice to murmur peace in your last moments.'

'Will you then condemn me to feel that I have made this sacrifice in vain?' asked Budiak. 'Will you compel me to see my own sufferings aggravated by your participation in them, without having the power to alleviate a single pang? Have you forgotten that if you are found here at dawn we shall both be the victims of an act for which I alone should be responsible? You will not—cannot bid me suffer this? Come, come, my lord, arouse yourself and depart, and let my bodily sufferings be forgotten in the intense yearning with which I shall follow you in thought upon your homeward path.'

'I will not leave you thus,' persisted the knight.

'Nay, then, hear the truth'—and once more the gallant castellan raised himself upon his arm, and struggled against the faintness which was rapidly overcoming his strength—'even now I feel that I am dying. My heart flutters a while like a newly-caged bird, and then stands still; and the blood that is draining my veins drops cold and thick, as though little more remained to shed. Farewell.'

The last words were scarcely gasped out when the sufferer fell heavily back upon the earth, cold, rigid, and unconscious; nor did the knight for an instant doubt that the spirit of the stout soldier had fled for ever."

For a time the knight could only weep over the body of Budiak, who had proved his devotion to his master at such a price; but thoughts of home gradually grew thick and fast upon him. Budiak, too, must not have died in vain; and Emmerick roused himself to attempt his escape. He succeeded, and after a time got rid of his affecting burden. At length, "wearied and wayworn, he reached a spot whence he could look upon his home; but even as he stood gazing upward on its tall towers bathed in light, and its dark frowning battlements that formed a warlike and threatening coronal to the steep rock which they surmounted, a solemn strain of music swept downward to the valley, like a requiem for the dead; and a cold chill gathered about the heart of the wanderer, as he asked of a peasant who stood beside him, and who had been his guide through the difficult passes of the mountain, why that mournful strain was pealing out.

'Stranger,' was the reply, 'had you been an inhabitant of our province, you would have known that two years since this very day the brave lord of Loewenstein, on whose castle you are now looking, fell in fight against the Tartars; and his lady, who has never yet cast aside her mourning weeds, is celebrating his annual requiem, surrounded by all his vassals and retainers. Well may they weep for him, for few have ever mourned a better master.'

'Why are you not among them if you mourn his fate?' asked the knight.

'It was this errand which brought me into your path,' replied the serf; 'I am bound for the castle even now, and trust I shall not arrive too late.'

'I will be your companion,' said Emmerick; 'the prayers of the soldier and the wayfarer will be welcome.'

'As you will,' was the reply, and in another moment they were breasting the steep ascent to Loewenstein, each too much absorbed in his own reflections to weary his comrade with words; nor did the knight resent the blunt fellowship of his guide, for two years of famine and wretchedness had so altered him that he was as one disguised, whom none might recognise; and thus he approached his own halls, in hopefulness of spirit, but the mere shadow of his former self, clad in rags, and wasted by famine.

When they reached the chapel, they found it hung with sable drapery, and lighted by torches; and even as she had stood before the altar in the first days of her imaginary widowhood, so stood the lady Agnes now, covered from head to foot in a thick black veil, and surrounded by her children; her meek eyes raised to heaven, and her cheek pale from vigils and regret.

As he looked upon her, the knight could scarcely refrain from clasping her to his heart, and kissing away the tears which were falling fast into her bosom; but the solemn service had commenced, and he felt that he was once more kneeling before the altar of his faith, and that his first emotions of gratitude and love were due to Heaven; but so strongly was he moved as the rites proceeded, that many about him looked anxiously and curiously on the strange man who had come among them at such a moment, no one knew whence, to weep as they wept, and to mingle his grief with theirs.

When the service terminated, the lady Agnes proceeded from the chapel to the great gate of the castle, to distribute alms to all such as might be there to receive them; and no hands save her own and those of her fair children were suffered to aid in the distribution of the food, which, as each received it, was repaid by a prayer for the dead.

In his turn, Emmerick approached the sad and gentle lady; but ere he did so, he drew from his bosom and displayed above his tattered vest a small picture of the Virgin, suspended about his neck by a chain of her own hair, which she had hung there years before, on one of his departures for battle, and which, from its utter want of intrinsic value, his captors had suffered him to retain.

The ornament caught the eye of Geysa, his elder and favourite son, and the boy drew to it the attention of his mother by exclaiming—'Serve this poor pilgrim, I beseech you, mother, for he seems faint from toil and want; and he must surely be a good man, for see, even amid his rags, he has preserved a picture of Our Lady, which he might have sold for food.'

Thus urged, the lady Agnes drew near the mendicant, and as her eyes fell upon the relic, she at once recognised her own gift; but for a while she stood speechlessly gazing upon the gaunt and squalid figure before her, and then, throwing back her veil, she bent down with parted lips and distended eye-balls, like one paralysed by a hideous dream, and gasped out—'Speak! Whence are you? Speak!'

'Agnes!' murmured a well-known voice, and in the next instant Emmerick once more held his beloved wife in his arms."

The story now returns to Budiak, who recovered from his faint, and whose condition at once told the Tartars in the morning what had taken place. "'Thou shalt die the death of a dog, vile slave!' exclaimed the chief; 'without help and without pity.'

'I care not,' was the reply; 'I have saved my master.'

'And he has left thee here to perish,' sneered the Tartar general.

'He thought me dead,' said Budiak firmly; 'and he is now free, and will be ere long in his own halls.'

'Only tell me that thou hast repented the rash deed, and that were it yet to do thou wouldst refuse,' urged the astonished Cadan.

'I may not pass away with a lie upon my lips,' said the castellan; 'I would lop every limb save that which did the holy work, could I by the sacrifice insure to him the happiness of a life of freedom and success. And now let me die; I have nothing to regret or to excuse; and I would fain pray for my chief and for my country while I have yet breath to do it.'

The Tartar general turned aside in deep emotion. In the half-savage devotion and self-sacrifice of the Hungarian vassal there was a haughty carelessness of suffering, and even of life, which he could at once appreciate and admire.

'He must not perish thus,' he said to his astonished attendants; and then stooping towards the castellan, he added gently, 'Christian, thou hast conquered. The sun rests to-day upon my weapon, but its beam may glance off in some hour of peril, when such love as thine may be beyond all price. Strive against thy weakness, and live. Care and rest may yet restore thee; and I swear that for the sake of the noble lesson thou hast taught to my own followers, thou shalt no sooner be able to keep the saddle than I shall give thee gold, and arms, and such a steed as it shall become a Tartar chieftain himself to cross, and send thee under a safe escort to thine own people and thine own land, that the proud Hungarians may learn that Cadan can also respect the virtue of fidelity.'

In deep gratitude and amazement the overjoyed Budiak endeavoured, maimed and tortured as he was, to cast himself at the feet of his generous captor; but as he ceased speaking, the Tartar left the cell.

The thought of home and freedom, combined with the care of those around him, who fulfilled to the letter the instructions of their chief, soon restored the castellan to some degree of strength; and he no sooner believed himself able to encounter the fatigue of the undertaking, than he obtained permission to set forth upon his journey.

At length the blessed moment came, and joyful was the welcome with which for the second time the inhabitants of Loewenstein received, as if from the grave, one whom they had long mourned as lost to them for ever. He came to them crippled and wasted, it is true, but he was again among those who were to him dearer than limbs or life; and he felt himself pressed to the heart of his grateful master, and greeted by the name of 'brother;' and the happy tears of the lady Agnes were on his hand, and the kisses of her children upon his lips, and all around him was care and congratulation."

This beautifully told tale of vassal devotion will satisfy our readers that the name of Miss Pardoe is still, as formerly, a secure guarantee for the interest of any work to which it is prefixed.

SKETCHES IN NATURAL HISTORY.

EVIDENCES OF DESIGN IN THE STRUCTURE OF INSECTS. (CONCLUDED.)

No one can look upon a tranquil sheet of water, during the spring and summer months, without at once perceiving that it is almost as fully replenished with insect life as the air itself. Multitudes are seen disporting on the surface with an infinite variety of movement; others are resting with the body in an oblique direction, having only the hinder extremity in contact with the air, as if in a state of indolent repose, but in reality executing an indispensable function in their economy; while not a few are darting through the clear element or moving about the bottom. It is impossible to watch their varied movements without at once concluding that they are endowed with many different modes of progression, suited to the medium they inhabit. Aquatic insects are in no case provided with true fins; various other ingenious contrivances are resorted to in order to supply the means of motion. What more likely to answer the purpose than *paddles* and *oars*? With these, accordingly, many species are provided, and their motions are performed, by means of them, with admirable ease and velocity. The little black beetle, whose polished coat sparkles in the sunshine like a piece of burnished metal, and which must have attracted the attention even of those most indifferent to such subjects by its sprightly movements on the surface of every sheltered pool, describing a series of circles in endless succession, and occasionally darting to the bottom with a bright silvery globule of air at its extremity—this active and sportive little creature is a paddler. We have seen that, in digging insects, it is the fore-legs that are made to do the office of a pick and spade; it is obvious that none of the others, from their position, could answer the purpose. The propelling power in the water is most effectually applied at or behind the middle; the fore-legs of the water-beetle in question (*Gyrinus natator*) are therefore allowed to remain nearly in the ordinary shape, and the middle and hinder pair are converted into paddles. This is done by shortening and strengthening them, dilating the last section into a pretty broad plate, ciliated or fringed with hairs, so as to present a considerable surface to the water. Four such implements, plied with the utmost vigour, sufficiently account for the rapid motion of this curious little creature. Its gyratory movements are no doubt performed by its working the paddles only on one side of its body at once, just as the rowers of a boat turn it by ceasing to ply the oars on one side. There is another part of its structure manifesting such a careful forethought for its safety and accommodation, that it must not be passed unnoticed. Moving on the surface of the water, as it habitually does, it requires to see objects in the air, and, at the same time, it is desirable that it should have the power of looking downwards, as it has enemies both above and below. The eyes are placed on the side of the head in such a manner that one-half of them looks upwards and the other downwards; and, having a process from the anterior part of the head running across the centre, they present all the appearance and perform all the offices of four eyes—a pair for the air and another for the water.

Let us now take an example of what may more strictly be called the analogues of oars. The water-beetles formerly alluded to (the *Dytiscidæ*) possess them in great perfection. The hinder legs are long and thick, and the joints of the tarsi are broad, flattened, and fringed on the inner side with a strong series of hairs. This may be called the blade of the oar. When the leg is drawn forward, the sharp edge cuts the water, and the cilia, or hairs, fall into its wake without offering any resistance; but the moment the pressure backwards is applied, the flattened side of the joints and the expanded cilia meet the water, affording a sufficient *point d'appui* to propel the insect forward with great speed. This instrument admirably answers the intended object; but a similar one, still more fully developed, occurs in what is called, *par excellence*, the *boat-fly* (*Notonecta*). In this case the oars are of such length, viewed in relation to the size of the animal, that they may not improperly be called *sweeps*. They are constructed on the same principle as those last mentioned, but the tarsi are more densely ciliated. They are placed almost exactly amid-ships, so to speak, so that the propelling power is exerted just at the place corresponding to that where the engineer finds it most expedient to fix the paddles of a steamboat. The insect aids their action by a singular instinctive habit, the design of which can neither be mistaken nor fail to be admired. The under side of its body is nearly flat, and covered with those fine hairs which are designed to repel the water in aquatic insects; the back rises, with slightly bulging sides, into a dorsal ridge, not inaptly representing a keel; and the whole surface is very smooth and glossy, admirably fitted for gliding through the water. An accurate notion may be formed of the little animal's appearance when swimming in the ordinary way, by supposing it to resemble a decked boat moving on the surface of the water with the keel uppermost, which, though not so awkward in the insect as in the case supposed, is still an incommodious and inefficient mode of ploughing through a resisting medium; and as the centre of gravity is towards the back, it has a tendency to fall over. The reader, we feel assured, anticipates what is to follow; the insect, at all events, has no difficulty in determining what is best in such circumstances, and, whenever it requires to move rapidly, it *turns itself on its back*.

In the examples formerly noticed of leaping insects, that power was seen to reside in the hinder legs; another tribe have the same property conferred on them by a very different kind of mechanism. In this case we distinctly see why there is a deviation from the ordinary means employed for leaping, and we likewise witness the introduction of a peculiar structure or apparatus for the purpose of accomplishing it. The insects in question are the *Elateridæ* or spring-beetles, which are pretty numerous in this country, and well known in their larva state under the name of wire-worms, as proving very injurious to many kinds of agricultural produce. Their bodies are long, and the back generally rather flat; the legs comparatively short and slender. The consequence of these peculiarities is, that when the insect falls upon its back, which it very often does when creeping upon plants, as its legs are not fitted for taking a firm hold of them, it is generally unable to replace itself on its feet. It is well known that the larger kinds of tortoises are incapable of regaining their feet when once laid on their back; they have no provision for the purpose, just because, when in their natural haunts, there is very little chance of their being overturned. With the insects in question, however, the accident so often occurs in the fulfilment of their ordinary instincts, that it became necessary for the well-being of the species that the consequences should be guarded against. A pair of thickened saltatorial legs would obviously not do: when once the insect is on its back, these cannot act; they are powerful levers, but the most powerful levers are useless without a fulcrum. A special contrivance is resorted to to meet the difficulty. From the under side of what may be called the breast-bone, a long spine or process projects in a backward direction, and this is received into a groove in the anterior of the abdomen. Without entering into a full detail of this apparatus, which is somewhat complex, being accompanied with several subordinate parts intended to aid its operation, suffice it to say that, when the insect is placed upon its back, it has the power, by its means, of leaping suddenly into the air to a considerable height. The force producing this bound does not take effect exactly in the centre of gravity, but rather towards the anterior part of the body; the consequence of which is, that the animal turns upon itself, or makes a summerset in the air, and falls upon its feet. It can leap much higher than is necessary for this purpose—we have frequently seen it spring out of a box upwards of six inches deep; but nature often works out several purposes by one instrument, and it uses this faculty both as a means of escape from enemies and of rapidly changing its place as it may be inclined.

When we observe the different situations in which insects occur, and the kind of substances among which they often live, we might very naturally conclude that a supply of atmospheric air is not always necessary to maintain them in life. Nothing, however, could be more erroneous than such an inference; in all their different stages of metamorphosis, and in every possible mode of existence, air is as indispensable to them as to animals possessed of lungs. But the situations and substances in which they must often live in order to fulfil the functions devolved upon them in the economy of nature, are of such a kind as to render it a matter of extreme difficulty to convey to them the requisite supply of this essential element. We accordingly find that the means employed to effect this object are very diversified and curious, affording some of the most remarkable and interesting specimens of design and provident care to be found in this class of animals, fruitful as it is, in all its departments, in examples of this description.

In digging into substances of considerable density and adhesiveness, such as putrescent vegetable and animal matter, the head has of course to force the passage, and is consequently most deeply imbedded in the mass; as a matter of general convenience, therefore, insects never breathe by the head, but most commonly *by the tail*. To leave a free opening into that for the access of the air, it is very frequently, in larvæ, surrounded by a series of flexible rays, which are closed over the aperture when there is any risk of it being filled up, and, when the tail is at the surface, are expanded like the widened mouth of the common funnel used for pouring liquids into narrow-necked bottles. The most beautiful and elaborate example of this kind of apparatus is found in the larva of the chameleon-fly, which lives in water. The hinder extremity of the body is surrounded with a circle of about thirty diverging rays. These rays are beautifully feathered, capable of repelling water, and the aperture they surround communicates with two large air-vessels, which ultimately ramify into every part of the body. When the insect desires a supply of fresh air, the tail is raised to the surface, and the rays expanded on all sides; thus a free communication is opened between the atmosphere and the aperture in the tail, even though the latter be a little beneath the level of the surface. The expanded rays serve, at the same time, to suspend the body in its vertical position. When about to descend, the points of the rays are drawn together, and a globule of air enclosed, which shines in its passage through the water like a drop of quicksilver. The use of this air-bubble seems to be both to afford a continued supply of air, and to render the body more buoyant when it becomes necessary to reascend. To facilitate the same object, when the air happens to be exhausted while beneath the surface, the animal has the power of again replenishing its little reservoir by forcing air into it from the air-vessels; thus making it serve the same purpose as the air-bladder in fishes. The design of the whole apparatus is most obvious, its operation most efficient, and its structure most beautiful.

The pneumatic mechanism employed in the aquatic larvæ of gnats is essentially analogous to the above, but differs greatly in the details, affording a striking evidence of what so many things concur to prove—that variety, for its own sake, independently of every other consideration, was an object kept in view even in the organisation, as it most unquestionably is in the adornment, of animals. These larvæ have been often described, and we shall not therefore notice them further. Such, likewise, may be said to be the case with the larvæ of a common fly (*Heliophilus pendulus*) which is usually called the rat-tailed maggot; but this affords such an admirable instance of the fact now attempted to be illustrated from the structure of insects, that it must not be entirely omitted. This larva *must* seek its appropriate food among ooze and mud, formed of decomposed vegetable and animal matter, always in a very soft state, and frequently covered with water; at the same time, it *must* have a communication with the air for breathing. How are these two necessities, in ordinary cases irreconcilable, provided for? The insect terminates in a long flexible tail, capable of being pushed out to twelve times the length of its body, which encloses a breathing tube through which the supply of air is conveyed. This tube can be lengthened and shortened to answer the occasion; and as the creature is sometimes on the surface when its services are not required, and where such a long appendage would be an incumbrance, it can be contracted to very small dimensions, the air-pipes, in that case, being coiled up. To describe this instrument is to demonstrate the design for which it has been constructed.

Other aquatic insects, which require to take in air

directly from the atmosphere, do so with instruments similar in principle to some of those noticed above, but varying much in form and appendages. The water-scorpion (*Nepa cinerea*) is provided with two long respiratory tubes, each composed of two pieces, grooved internally, and meeting each other very closely at the edges, thus forming an elongated siphon for conveying air to each side of the body. The *Dytiscidæ*, so often previously alluded to for their numerous peculiarities, rise to the surface of the water when they need fresh air, and push the hinder segment of their body above the surface, that part being so constructed as to admit and retain it. Many kinds of larvæ which are always submerged, never coming in contact with the external atmosphere, would speedily perish unless some special arrangement were made for their welfare. They are, accordingly, provided with gills or branchiæ, which separate and imbibe the air mechanically mixed with water, in a manner quite analogous to that practised by fishes.

Such are a few instances of design as manifested in this class of animals, and of the elaborate care and forethought that have been exerted for their preservation and enjoyment. Similar examples might be multiplied to an extent nearly commensurate with all that is known of the history of these animals; for almost the whole of that history might be so digested as to form one continuous illustration of the same great truth. Whenever we see an apparent inaptitude of means to an end, an apparently cumbrous and unnecessary apparatus, the seeming defect should be ascribed to our own ignorance. Whenever the purpose wrought out is thought to be unimportant, we ought to consider that we are judging of its utility by a wrong standard. The very instances which present the greatest difficulties and appear most anomalous, are just most likely to be those which, if fully understood, would afford the most convincing demonstration of intelligent design and benevolent intention.

PEDESTRIAN EXCURSION IN SWITZERLAND.

[We have much pleasure in presenting the first of a series of papers, descriptive of the pedestrian excursion of a friend through part of Switzerland and Savoy in the autumn of 1841, at a time when one of ourselves was engaged in visiting the country. The route being considerably different from what was adopted on that occasion, and more among scenes of a romantic character, it is believed that the papers will form a suitable appendix to the articles—"A Few Weeks on the Continent." The writer commences his journal from Zurich.]

AUGUST 17.—It was a fine misty morning when we—that is, two companions and myself—left Zurich by the steamer for Horgen, a town half way up the lake, whence it was our design to commence a pedestrian tour of some days, without any very definite views as to the direction in which we should bend our steps. In the spirit of pure independence, each one had a knapsack strapped on his shoulders, and carried with him his full equipment for the journey. Nor were we content with a provision of raiment. Taking it into consideration that we should have to wander among barbarous regions, and that starvation is a great neutraliser of the enjoyments of travelling, we made an effort to victual ourselves in anticipation of any emergency. The chief article we laid in was a huge sausage—a congeries accumulated on such gigantic principles, that among its contents was a tongue, whole and entire. This monster-sausage there was no conveying without a special receptacle, and therefore we had to purchase a basket for it—which, by the way, though bought in pure simplicity and ignorance of the basket-trade, was declared on our return, by those cognisant of such matters, to be a miracle of art, and of a species not to be purchased in any part of the united kingdom. We were not ashamed of a respectably-sized flask, hung like a powder-pouch by a ribbon, for who would grudge a few draughts of light wine to persons struggling with such perils and fatigues as we proposed to encounter? We had pipes, also, of various shapes, but mostly considerable in size, which gave us quite a pastoral look. When we add to this that our dress involved straw-hats and blouses, the idea that frequently crossed our minds will be readily sympathised with, namely, that being men of business, and of a staid and sedate walk in life, had any of our usual friends met us in our own street, attired as we were when we stepped from the steamer at Horgen, he would have been undoubtedly justified in taking measures for having us conveyed to the nearest lunatic asylum.

Horgen is a small town scattered over a steep declivity facing the lake. We made our way through it as fast as we could, for we longed to try our strength on a Swiss brae. We found the Albis ridge a pretty smart pull, but altogether on a small scale. When we reached the top, we were disappointed in the expected view, for the mists with which the air had been for some days impregnated, though they showed a laudable intention of making off, were still lingering here and there in groups, like a party of disagreeable people, who, after they have fully announced their departure, spend a world of time in bidding each other good-by. In our descent we entered an unassuming *gasthaus*, where we comforted ourselves with bread and cheese and wine; after which we proceeded on our route, and finally we entered Zug, along with a diligence, bringing with it some of our fellow-passengers in the steamer.

It was now high noon: the sun had pushed for himself a hole in the clouds, and fell upon our heads blazing hot. A dip in the pellucid Lake of Zug we found to be delightfully refreshing. We had visions of doing something considerable on this day, and therefore we pushed on in defiance of the heat. We had gone a very few miles beyond Zug, when the mists cleared away from the brow of a stately lion-shaped mountain, which our map told us must be the celebrated Righi, from whose summit is to be seen the great show of the panorama of the Alps; and we resolved, if possible, to reach its top that night. We had not travelled far when we met with an ingenuous shepherd, who, descrying with benevolent skill our intention, made strenuous offers of his services in aiding us to discover the route. I made an attempt on this occasion to take advantage of the stranger's privilege, and to overlook the real motives of this kind proposal—thanking the swain for his disinterested proffer, and expressing a strong repugnance to coming under so great an obligation to one on whom I had so few claims. I met the usual and deserved fate of insincerity: the man had no scruples whatever in putting his proffers in the most mercenary shape; and I soon found, that so far from hints and misunderstandings being efficacious, a downright stern refusal was scarcely a protection from the resoluteness of his importunity. Having at last shaken off this incubus, we proceeded rejoicing in our liberty. The mists were clearing wider and wider away; and at length we saw, rising up to our right, heights that put the sedate and sombre Righi to scorn—the shattered and spiky top of Pilatus basking in the afternoon sun.

Passing the village of Arth, at the extremity of the Lake of Zug, our guide-books prepared us for beholding one of the most awful scenes in the world—the place where the fallen mountain of the Rossberg had overwhelmed the village of Goldau. This catastrophe occurred in the year 1806. The summer of that year had been warm and rainy. The upper stratum of the hill, a sort of conglomerate, slopes down towards Goldau at a great declivity; and as the conglomerate is separated from the stratum below by a layer of clay, it is supposed that the rain oozing through crevices (to which conglomerate is liable) had prepared a sort of slimy inclined plane for the superincumbent mass to slide along. Be this the cause or not, down came a cake of conglomerate 3 miles long, 1000 feet broad, and 100 feet thick, with all its trees and fields,

> "as if on earth
> Winds under ground, or waters forcing way,
> Sidelong had push'd a mountain from his seat,
> Half sunk with all his pines."

There were houses, fields, and gardens, on the moving slope: there were smiling villages in the valley into which it came hurtling down. Imagination is sufficient to supply the appalling picture; it needs no description. The summit of the Rossberg was 5150 feet above the level of the sea; the valley into which the mass fell is 1500 feet above the same level: thus, the cake of rock slid down about 3500 feet, and, losing its original compactness, reached the bottom a chaotic mass of broken rock, earth, and mud. Three villages, with 450 human beings, were destroyed by the direct effects of the fall; and so much of the heap was driven into the Lake of Lowertz, five miles off, that the waters heaved up seventy feet above their level, swept the opposite shore, and brought back a pillage of houses, trees, and human beings, in the bosom of the receding wave. Eleven tourists were approaching Goldau to climb the Righi when the event occurred; seven of them had entered the village, when the others, lingering a little behind, observed the surface of the mountain in motion, and stood gazing on the ominous phenomenon. Suddenly the scene changed; these members of the party had not entered the course taken by the descending rock, but they were so near its verge that the minor detached particles flew over their heads, obscuring the light of day. They fled back, and, happily for themselves, in the right direction. When the turmoil was over, they returned in search of their friends; but found that a new mountain had reared its head over the spot. Of those who had been carried down on the surface of the slope, some few miraculously escaped with their lives, and were dug out of the ruin by the neighbours; but the spade and the pickaxe might as well have tried to uproot Mont Blanc, as to be of service to those in the valley. Their bones are deep hidden in the crust of the earth, where they will remain till our planet itself comes to pieces.

As we entered the mouth of the valley between the Rossberg and the Righi, we soon noticed a great red scar, marking the place from which the rock had separated; it looked as fresh in its contrast with the grey old rocks and the dark pines, as if the tragedy had happened yesterday. As we advanced it gaped wider, and we saw the traces of the stony cataract sweeping down from it into the valley. Every step brought us more into the midst of the desolation. The road wound up irregularly among the fragments; and at last we reached the top of this sepulchral hill, and looked around us on a wide expanse of stony desolation—a ghastly contrast to the luxuriant fields and orchards we had just passed. There were one or two small lakes on the surface of the hill—portions evidently of the Lake of Lowertz, which the heap had caught up and restrained in its descent. Here and there were gnarled old trees, which had been carried down in the general ruin, still clasping some portion of their native earth, and managing to lift their heads above the stones and live.

But the sun was hiding his head, and we had still a great hill to climb unguided, so we had to cut short our meditations among these tombs. Our ascent, however, still kept the whole forcibly in our mind, for we had to pass up many hundreds of feet among the blocks of stone which had been projected up the acclivity by the impetus of their fall. When we had climbed up still higher and looked round, the whole scene was again presented to us more amply than ever, but in the silent gloom of twilight. The path here became steep and rude, and by its side is a succession of chapels, thirteen in number, marking so many stations into which the narrative of our Lord's passion is divided. We thought there was a unison in the feeling created by these little gloomy places of worship, and that which had been suggested by the tragic spot they overlooked. To the Catholic inhabitants of the district, with whom the tragedy is a household event, this association must be deep and solemn. The chapels are in themselves sufficiently impressive; standing in rocky recesses or under the shadow of dusky pines. When you enter them, you see a large crucifix, or a *mater dolorosa*, looking ghastly in the darkness. Here Wordsworth's fine lines are forcibly recalled—

> "Doom'd as we are, our native dust
> To wet with many a bitter shower,
> It ill befits us to disdain
> The altar, to deride the fane
> Where patient sufferers bend, in trust
> To win a happier hour.
> * * * *
> Hail to the firm, unmoving cross
> Aloft, where pines their branches toss,
> And to the chapel far withdrawn,
> That lurks by lonely ways."

The chapels form a train to the church of *Maria zum Schnee*, or, Our Lady of the Snow—a place of pilgrimage which received a grant of indulgences in the seventeenth century. When we had scrambled up the steep path, which is for a considerable distance a series of large and rude steps, we found ourselves, when darkness had completely set in, in the midst of what might be called a small village of hospices and inns, which the piety of pilgrims, or the wants of tourists, had clustered round the church and little convent of our lady. Our path led us along close to the windows of one of the hostels, and somewhat above their level, and revealed to us a most invitingly prepared *table d'hôte*, with its long range of wine flasks. This was somewhat tempting; but there was no sunrise from the Righi to be seen by those who should yield to such sublunary inducement, and, firm in our unconquerable virtue, we pushed on. Though it was dark, we had not now the additional obscurity of the pine forests; vegetation at the elevation we had reached is stunted, and we trod chiefly on short velvety grass. It was with great satisfaction that at last we beheld a light at an acute angle above us, and then the outline of a house between us and the dark sky. Here we found all that is most needful for those whose feet have all day long been pressing the sod, and speedily we were visited by slumbers deeper than those which the comfort and security of home bring to the pillows of the sedentary.

August 18.—Dreaming of any thing but the Alps and the Righi, I was roused at four o'clock by a simultaneous and indomitable sort of disturbance, created by the general rising of all the inmates. So little had the gloom of the previous evening prepared us for what met our eyes, that had it appeared from my bedroom window in —— Street, it could not more have astounded me. Right before the window, as if they had been on the opposite side of a street, rose the white Alps, looking in the dim ante-sunrise light, as if some lurid atmosphere had been drawn like a thin curtain before them; so thin, that while it gave every thing its own strange hue, it obscured nothing. Here was what we had come all the way to see; and we allowed that it had presented itself in its most attractive form. It was almost unwillingly that we kept our eyes off this scene to hurry our partial toilet, for it was absolutely necessary for our character that we should be at the top of the hill—half an hour's walk (we had not been so fortunate as to light on the inn next to the top)—by sunrise. As we went we saw one by one the cold icy peaks blaze up with a deep roseate glow as if touched by fire, when each in succession caught the horizontal rays of the sun. We were not quite in time to see the luminary touch the horizon with his upper arc, but we saw all the effect, and we could not better express our satisfaction than by observing that the sight was worth coming so far to see. Half way round the circle of the horizon, to the south and east, rose the snowy peaks in multitudes innumerable. So perfectly clear was the atmosphere, and so completely had the clouds of yesterday hidden themselves in unknown corners, that the giant masses appeared small and near, and all their parts were distinctly seen; their forest sides, their precipices, their blue glaciers, and their white snowy cones, all appearing as if their scale were reduced, and as if the mighty Alps were set before us in miniature; in short, the whole seemed an exquisite model; and it was difficult to imagine that in any thing so pretty and peaceful looking there were at that moment roaring torrents, and avalanches, and stormy winds, and thunder-splitting icebergs. On the other side of the panorama lay the fruitful Aargau and the canton of Berne, stretching, with their green hills and forests and pastures, into Germany and France. Beneath us lay the lakes of Lucerne, Zug, and Sarnen, yet far be-

low the reach of the sun, with their outlines clear and precise, like drops of molten metal that had fallen into the hollows of the earth's surface. There was a very respectable crowd assembled to see the sun go through his performance, for this somewhere about his two-millionth time; and several young Englishmen, clustered round a wooden scaffold or stand, and talking loudly to each other in a most how-de'doish and 'pon-honourish tone, gave the spot quite a sporting character, and reminded one of an English race-course.

We soon began to feel that we were 6000 feet above the level of the sea, and to desiderate the warmth of exercise. The hoar-frost, indeed, lay thick, and, notwithstanding the sun, the air pierced us. Nor was it difficult, at least so far as I myself felt, to withdraw from the scene, however striking; for, after all, it was but a show. Now, I can never be content with merely gazing at scenery from a distance; I must have a sort of manipulation of it; I must smell the fragrant pines, scramble among the rocks, or peep into the abysses of the waterfalls; and so, instead of lingering to contemplate the view from the Righi, I felt excited by what I saw of it, to march immediately into the interior recesses of the great array of mountains it presented to my view.

After breakfast, we took the descent leisurely in the direction of Küssnacht. We passed through multitudes of the beautiful fawn-coloured cattle fed on this mountain—amounting to several thousands in number. A large proportion of the hill-fed cattle of Switzerland have bells suspended by their necks, for the better tracking of their course when they wander from the herd. These are not the little tinkling instruments with which we adorn a bell-wether, but huge sonorous things as large and as loud as a dinner-bell. Hence, when one comes, as is not unfrequently the case, on a herd of several hundreds grazing in a narrow glen, the effect is most bewildering; it is as if half the church steeples in Europe had taken to dancing a saraband together. Almost at the termination of the descent there is a grey old ruin, which tradition marks as the fortalice of Gesler. We here made a slight detour to visit the place where the tyrant is said to have been shot, and where a chapel is dedicated to the act of wild justice. The spot is still what tradition describes it to have been when the deed was done—a deep rutty path, with abrupt banks surmounted by trees and brushwood, behind which the archer awaited his enemy. So completely does it still answer the description, that one is apt to suspect it to have been tampered with, for the trees that shaded Tell must by this time have disappeared, or would have been gnarled and venerable with age, whereas those which now occupy the spot seem fresh and young. Over the door of the chapel is a rude representation of the scene of violence. Within the walls so singularly consecrated we were importuned by beggars; it seemed a strange spot for a Swiss to choose for the exhibition of the most degrading national characteristic. In Küssnacht there is a church not large but venerable, and in a chapel adjoining lie several skulls rotting on the floor. It was past noon when we left this village, and we wandered from it along the pleasant banks of the lake till we reached Lucerne, where we spent the evening.

NORTHERN COLLIERIES.

THIRD ARTICLE.

In no collieries in the world has the practice of ventilation been more scientifically investigated and carried out than in those of Newcastle. In most other coal-mining districts it is a matter little understood and less enforced. Nor, indeed, is it so essentially brought under notice in any coal-field as in the northern; for the very magnitude of the mines and the mining interests renders the keenest attention to this subject absolutely indispensable to the daily existence of the pits in a working condition. I will endeavour, as briefly as may be, to notice the main features of the scheme, although, from its technical nature, I can scarcely hope to make it more than generally understood here. It is probably well known that the object of the ventilating system is to clear the pit of the noxious gases exhaling from the coal, and thereby to enable the miners to exist and breathe freely in the remotest parts of the mine; as also to enable them, under certain restrictions, to employ candles and lights without danger of producing explosions.

The chief component part of inflammable pit-gases is carbureted hydrogen gas, mixed with unequal quantities of olefiant, carbonic acid, nitrogen, and other gases. They exhibit a very different degree of inflammability when mixed with atmospheric air, according to the different proportions they contain of nitrogen, carbonic acid, and olefiant gases. The first two gases diminish, the last increases, their inflammability. The larger the amount of atmospheric air with which they can be mixed without losing their detonating power, the more dangerous are the explosive mixtures formed by them in coal-mines. Sir Humphry Davy found the most readily-explosive mixture of fire-damp with common air to be one measure of the inflammable gas to seven or eight of air.

As the pits in this great coal district abound in the inflammable gases, it is absolutely essential to adopt the most perfect system of ventilation that can be devised; and on this point the industry and ingenuity of the most eminent colliery superintendants appear to have been concentrated. The main and general principles which have been carried out into their existing detailed system by the improvements of John Buddle, Esq., and other experienced viewers, may be said to resolve themselves into these four particulars:—

1. The downcast shaft. 2. The upcast shaft. 3. The free course for the entrance, transit, and exit of the atmospheric air. 4. The rarefying furnace (placed at the bottom of the upcast shaft).

If these four *desiderata* be supplied, the ventilating system may be considered as nearly perfect as possible. The agent of the ventilation is the difference between the weights of two columns of air, one of which is at the natural temperature, and the other rarefied by the heat of the furnace; and this furnace, to *draw* the foul air through the shafts and passages, is the grand engine of ventilation. The furnace is usually five or six feet wide, and is placed at some little distance from the bottom of the shaft. It is constantly burning, and repeatedly supplied with coal, and over it the return air passes by day and by night. If, however, the returns become so impregnated with the inflammable gases that they would take fire at the furnace, they are in that case conducted *over* the furnace in a separate closed channel, called a "dumb furnace," so as to enter the shaft some distance above the place where the fiery furnace enters it. By this very ingenious method a full draught is produced, as in a common chimney, without incurring any risk of explosion.

It may be, I trust, understood from this brief notice, that the great object to be accomplished in endeavouring thoroughly to ventilate a coal-pit, is to cause the currents of pure air to go through the mine in much the same way as a human being would do who was desirous of exploring every corner of it. To induce the air to perform this journey, it is coaxed and wheedled round corner after corner, up this passage and down that, by all the means that can be devised to act upon it. It is astonishing to witness the varied contrivances for securing its presence or turning it off, as if it were a stream of water flowing down a moderate inclination. Sometimes it is desired to force it up one-half or side of a passage, and to make it return by the other half or side; and this is accomplished by the erection of a wooden partition all along the passage. By the same means, also, it may be made to fork into two distinct splits, one pursuing its course to the right and the other to the left. By the aid of the crossings or arches, it may even be compelled to perform a summerset, and to adopt almost any course and shape. When it is necessary to put a stop to the flow of a current of air in any of the main-ways of the mine, through which there is a constant transit going forward, there are erected wooden doors, generally called "trap-doors," and these are opened and closed by children of from seven to ten years of age, who sit behind them, all the time that the pit is at work, for that purpose. There are also some other kinds of doors occasionally employed in less important places in the mine, which are not attended by any one.

Upon the quantity of air passing along the main air-course, chiefly depends the safety of a fiery mine. The superintendants, therefore, are constantly watchful of the supply, and its measure is sometimes taken. It has been asserted, on good authority, as a general rule, that, in extensive mines, a current of little more than three feet per second can be calculated upon. The mode of ascertaining these measurements is by timing the rate of travel of the smoke of a few grains of exploded gunpowder, and less accurately by the state of the flame of a candle, in walking at certain rates of speed.

When the steel mill was the only kind of light used in mines, it was found very difficult to see at all in the deeper recesses of the workings, where, from the greater discharge of gas, the sparks of the mill sometimes seemed to fall like drops of blood, with a slow motion. The Davy lamp, however, affords a tolerable light, and may be safely taken where the steel mill could not be allowed. Most persons are aware that a Davy lamp consists of a wick fed with oil, enclosed in a wire-gauze cylinder, the apertures of the wire-gauze being extremely small, at least 625 to the square inch. It was discovered by Sir Humphry Davy (although the priority of the discovery is not indisputable) that flame would not pass through these apertures. Within this cylinder, when the fire-damp encompassing it is to the air as 1 to 12, the flame of the wick is seen surrounded by the feeble blue flame of the gas. When the proportion is as 1 to 5, 6, or 7, the cylinder is filled with the flame of the fire-damp; but though the wire-gauze becomes red-hot, the exterior air, even when explosive, is not kindled. The lamp is therefore safe in the most dangerous atmospheres. Its safety depends upon the cooling agency of the wire-gauze exerted on the portion of gas burning within the cylinder. Although I found the perfect safety of this lamp to be assumed by nearly all the viewers of the northern collieries—which fact would appear to be a very strong evidence in its favour—yet by many persons this is not considered to be sufficiently established. After lengthened inquiries and conversations with the best authorities on both sides, I am inclined to conclude, that still more cogent proofs of insufficiency than have hitherto been adduced are requisite to overturn our faith in the original Davy lamp.

The subject of accidents in coal mines is palpably one of the very highest moment. In Mr Leifchild's Report is presented a detailed list of the accidents which have occurred in pits in the Tyne and Wear district from 1799 to May 1841; and although, from the exceeding difficulty of obtaining statistical accounts in the collieries, I have little doubt that it is incomplete, yet in this it appears that, at the least, *fifteen hundred lives have been sacrificed* in this space of little more than forty years. The majority of these have been lost by explosions, and not a large proportion by ordinary casualties. Independently of carelessness on the part of men and boys, there are natural causes productive of these catastrophes. The ventilation of a pit may be sufficient on one day and not on another; for a change in the state or temperature of the common atmosphere will necessarily alter the efficiency of the ventilating current. In the recesses of deep mines, where the gas is naturally the most rapidly generated, the temperature would seem to continue nearly uniform throughout the entire year. When, therefore, the air of the day is warmer, and consequently more rarefied than that of the mine, it has no natural tendency to rush into the shaft. On the contrary, however, an increased coldness in the air of the day causes the heavier atmosphere to descend the shaft, and the warmer current to escape from it. Now, an analysis of 71 explosions, causing an aggregate loss of nearly 1000 lives, has proved that 8 of these catastrophes occurred in winter, 13 in spring, 20 in summer, and the remaining 30 in autumn. In these cases, therefore, it is extremely probable that the temperature of the atmosphere had a very close connexion with the derangement of the ventilation. The gases of the mine have been found to be contained, for the most part, in crevices which open upon the coal. The fissures of the roof are in some places very extensive, and may be considered as natural gasometers, out of which the gas, not having any outlet, is exuded by the process of distillation going on from the coal to an almost incredible extent. The resistance to this issue lies in the quantity of rock or coal by which it is pent back; and also, when the quantity is very trifling, or none, to the pressure of the atmosphere. When, therefore, a sudden depression in the mercury takes place (a change which has been so frequently noticed to precede explosions, that it would seem to afford an excellent warning for the necessity of active precautions), the feeders of gas, which were before in a manner dammed back by the pressure of the air, are permitted to issue and vitiate the circulating current of ventilating air, which now moves but sluggishly. Upon this vitiation increasing to the explosive point, the pit is in imminent danger. In addition to the natural causes of explosions, there exists the carelessness of the men, and particularly the carelessness of the little boys who have charge of the trap-doors mentioned above. These children, when tending very important doors, have nearly the sole responsibility of the safety of the mine. The neglect of their duty or the leaving open of a principal trap-door for a short period, would entirely derange the ventilation, first in that particular district of the mine, and subsequently in the whole of it. It may easily be conceived, that a dull child of eight or nine years of age can scarcely be brought to comprehend the enormous weight of responsibility that rests upon him. Out of some scores that I examined at length upon these points, I found scarcely one that was at all sensible of it.

During my inspections of the collieries, I was engaged one Friday afternoon at Willington colliery, and had deemed it desirable to descend the pit and inspect the children at work, which I could not then do until the following Monday, as the Friday's work was nearly finished, and the Saturday was pay-day, and consequently a non-working day. I therefore arranged to descend on the Monday following. Fortunately for me, after-circumstances rendered my presence in another pit desirable. I say fortunately, inasmuch as on the Monday, April 19, 1841, at a quarter past one P. M., a terrific explosion blew the mine almost to pieces (as one of the survivors observed), and sacrificed the lives of *thirty-two persons!* I was at the scene of the catastrophe as soon as possible after its occurrence, and arrangements were kindly made for my descent. When I arrived at the bottom, I was perfectly astonished at the tremendous havoc caused, and the confusion of every thing around me. Nor was it altogether a scene of safety; for the recurrence of an explosion—not an unusual event after such an accident—and more especially a fall of stones from the roof, would have added me to the list of killed. To advance a single yard, I was compelled to follow my guide by scrambling over enormous masses of fallen stone, closing up half and sometimes nearly two-thirds of the height of the passage. The feeble light of the Davy was insufficient to prevent me from bruising myself most cruelly at times. One foot was frequently on a piece of sharp stone, while the other was in contact with some shivered fragments of waggons, or in a puddle of mud, caused by the vast quantity of water thrown down the pit to extinguish the fire, which at one time raged in the stables, near the shaft bottom. These unpleasantnesses, however, I did not consider so grievous as the sudden contact into which a fall placed me with a softer substance, which my elevated Davy discovered to me to be a dead horse; the hair of the animal seemed to be almost entirely singed off. A few yards farther, I encountered a body of men engaged in a mournful search for one of the four dead bodies as yet unrecovered. They had discovered the jacket of a poor missing boy when I arrived, and were engaged in deducing inferences from its position and

condition as to the locality of the body. After my return to open day, I called at the houses of most of the bereaved relatives, and glanced at the bodies of the sufferers. Those who had been killed by the "stythe," or after-damp, appeared as if they had been suffocated. The face of one of them, a little boy, exhibited a serenity almost resembling that of pleasing sleep. But when I cast my eyes on the corpses of some who had been the immediate victims of the effects of the explosion, I was truly horrified. In fact, a more impressive and revolting sight than that presented by one or two of these could not be conceived. Faces blackened to the hue of coal itself, and features almost obliterated, were of the worst. One body appeared very much like a mass of charred wood, in which but little resemblance to the form of a human being could be traced; and the countenances of some others were most fearfully distorted. Recollections of the terrific appearance of some of these bodies haunted me for many weeks afterwards, and caused me deeply to rue my curiosity.

THE PUZZLED HOUSEWIFE.

[The following sketch by Miss Sedgwick, though applying to American ladies, cannot be read without advantage in our own country, where reversal of fortune is unhappily too often experienced, and becomes a cause of domestic distresses. We copy from an American periodical.]

We have now, my young friends, to consider the domestic education of such of you as are the daughters of our rich merchants, successful professional men, or men of inherited fortune. If you are so fortunate as to live in the country, you will probably learn domestic economy from the necessity of your condition. Your opportunities of instruction may not be quite equal to Mary Bond's; but from the imperfections of our domestic service, from the incompetence of domestics, and the occasional impossibility of obtaining them, either the family wheels must sometimes stand still, or you must put your shoulder to them. Depend upon it, that if you are totally ignorant of domestic affairs, you are nearly as unfit to be a wife and mother as if you were lame in both feet and hands.

But what shall we say to those unfortunate young persons who, bred up in luxurious establishments in town, are cut off from accidental and irresistible opportunities of acquiring a knowledge of domestic affairs? They are as ignorant of domestic processes as is the lily, that neither spins nor weaves, of the modes by which it is more gorgeously arrayed than Solomon in all his glory.

This ignorance is all but an inevitable misfortune. There is an intrinsic difficulty in the case. All the arrangements of a town establishment, and all the arrangements of a town life, presuppose that the *ladies* of the house are to do nothing.

Such ladies may be so fortunate as to secure competent, well-instructed, and faithful domestics, but such are rare birds in our land; and those to whose share they do not fall, must make up their account to having sometimes confusion and disorder in their establishments, to neglected children and displeased husbands, to finding they have been imposed upon, or, what is far more painful, that they have been unjust to their domestics. How is this to be avoided? Only by an all-conquering sense of duty on the part of the parent, or by the combined sense and virtue of *self-training* daughters.

To show the disastrous and mortifying consequence of omitting this must have on a girl's education, we publish extracts from the letter of an accomplished friend, who, after keeping house for twelve years at New York, removed soon after a commercial crisis to one of the Western States.

After describing the richness and exquisite beauty of the country about her, and the change in her husband from extreme dejection to cheerfulness, in consequence of the happy change in his pecuniary prospects, she says—"But what does all this avail me? I am a miserable, mortified woman. Don't be alarmed by my language. I have not yet broken any of the laws of the land, nor lost my husband's affections, though I am sure I deserve to lose them; but read on and pity me. You know I determined to be virtuously economical, so I brought but two servants with me. This was rather a reduction from my usual establishment of six; but our fortune was reduced, and I wished to conform to my husband's circumstances. Anne was to be my woman of all work; she was country bred, and highly recommended; and the other, Rose O'Brien, was to be my children's nurse.

We sent on Anne some weeks before us to unpack the furniture, and get the house in order; and when we arrived, in nice order it was. Anne had found time for courtship; and the very day we arrived, she set off to be married to a young farmer at the head of the river.

I submitted; I could do nothing else. Rose had been brought up to nursery work, and was almost as ignorant as myself of all other household work; and besides, my hands were almost full with my baby, who was cutting her eye-teeth.

The first morning after our arrival, I determined to be energetic, and do my best to make my family comfortable till I could supply Anne's place; so I hurried on my dressing-gown, and went down to the kitchen to make the coffee. But how was it to be made? I ran up to ask Rose. She had 'always seen it made in a greeque;' so had I, but we had none. I thought that if I let it soak long enough in boiling water, it would be as good as if poured through a greeque. Accordingly, I soaked it till I had everything else ready. Anne had left some nice little trout all prepared to fry. I put them in a utensil that I knew was called a frying-pan, and there they dried away to a coal. In attempting to cut the bread, I cut my thumb; it has been ever since nearly useless to me.

'What stuff is that?' asked my husband, when I poured out the coffee. I burst into tears, and confessed my ignorance. 'You should have boiled it, my dear,' he said. The next morning I did boil it, but it was so thick it could not be drank. *How* to clarify it none of us knew—we drank tea for the present. I have my beds to make, my rooms to sweep, and my tables to set; but I am well and strong, and should not mind it (but I really feel the better for the exercise), if I knew how. Anne left us a large baking of bread. I looked forward with dismay to the time when that should be eaten up. We were reduced to the last loaf, and I begged my husband to ride over to the nearest neighbour (two miles) and get me some leaven; for I knew that bread required leaven, though I did not know how to make it, and unfortunately my receipt-book was in a package of books not yet arrived.

The good dame sent me some hard, bitter cakes, which she called 'turnpike emptyings.' How to apply them I did not know, but I grated them into my flour, and I rose in my esteem; but, alas! my bread did not rise! You laugh, my dear friend; I laugh, too, sometimes; but I assure you that I cry much oftener. All day and all night I waited for the dough to rise. In the morning it was the same lump as when I mixed it. My husband suggested it might rise in the oven; this seemed to me a bright thought, and into the oven it went; but, alas! it came out even more solid than it went in. My children were actually crying for bread, and I had little better than a stone to give them. I went to my room. My beautiful Petrarca was lying on the table. I looked at it for a moment with a sort of loathing. I would gladly have given all my knowledge of Italian, of which I have felt proud, to know how to make bread.

While I was lamenting my good-for-nothingness, my husband came in, and asked if he should unpack my piano. 'No, no,' I cried; 'I never will touch my piano again till I know how to make bread. Get me a horse if you love me, and let me ride over to that woman, and ask what she meant by sending those detestable *turnpike* emptyings.' By the time I got to Mrs Gates's my feelings were somewhat subdued, so that I asked very meekly for directions how to use the *turnpikes*.

'Gracious me!' exclaimed the good woman; 'I thought you knew as much as that!' I blushingly confessed I did not, and she gave me the directions. I went home, kneaded up my bread, and that evening's meal on the nice light loaf of my own making was, it seems to me, one of the happiest of my life.

My greatest difficulty was overcome; but every day and hour I experience the evil of my ignorance. I have obtained a raw help-woman. She is strong and willing, but ignorant. If I only knew how to direct, she could execute. Yesterday my husband had some pork sent to him. I, without much reflection, expected it to come as from the market, all cut up and prepared; but to my utter horror, the animals were whole. I am sure the family, consisting of my husband, myself, Pat, Biddy, and Rose, in joint council over the swine, were a group for Hogarth.

Ah! my friend, 'you who live at home at ease' little know the trials of *ladies* in the West. My husband had last week to go to Chicago to meet some gentlemen from Philadelphia on business. 'Those shirts,' said he, showing me the linen done up (undone rather) by Biddy, 'are too bad to go among civilised people. Could you contrive, my dear wife, to have one or two decently ironed for me?'

I faintly answered, 'Yes.' Biddy is quite competent to washing, so I gave her my orders, and then asked Rose, as a particular favour, to iron the shirts. She replied, pettishly, 'that she could not do every thing;' and I, not accustomed, you know, to submit to any impertinence from my people, retorted sharply. The consequence was that she fell to crying. 'If she could not plase me,' she said, 'she could lave me; it was Anne had invited her to come and live all the same as a sister with her, and sure that would be more plasing than living at service, and not giving satisfaction; there was no need of living a servant any way in a new country where there was room for all, and plenty.'

I am wearying you, but I must write of what my hands and heart are full. I ironed the shirts myself. What a labour it was! How often I thought of the weekly replenishing of my presses with clean clothes, never bestowing one thought on the labour they cost. My ironing turned out better than I hoped. I took infinite pains, you may be sure; and when I felt the glow of success, and my husband thanked me heartily, I fell to a little moralising, and came to the conclusion, that the humblest service may receive a certain dignity from the motives and feelings that attended them.

The great domestic problem at present to be solved, is how I shall provide my family with soap. I have abundant materials left by the squatters on our place, but, though I have attended three courses of chemical lectures, I know no better than Biddy does how they should be combined; and she could as easily transmute lead to gold as ashes and fat to soap.

My prospects, however, are brightening. Mrs Gates has promised to *lend* me her daughter Louisa for a month. She is to instruct Biddy and *me*. Louisa is what I now call an *accomplished girl*. Depend on it, the meaning of terms changes with our experience. At this moment I would give my accomplishments—all my knowledge of French, Italian, and music, for Louisa Gates's ability. You will say, perhaps, that I exaggerate their importance, owing to my present unfortunate position. Believe me, my friend, it can scarcely be exaggerated. A wife must be responsible for the domestic comfort of her husband and children. It is important to our concerns that my husband should give all his time to his own department of business; but he is every day interrupted by some domestic necessity that I do not know how to supply, or some petty embarrassment that I cannot relieve. I feel that I am not a *help-meet* to him. He has not home comforts. He is most kind and forbearing, and I am doing what can be done at my age to rectify the errors in my education."

In justice to the writer of the foregoing, I shall give a short extract from a letter written by her after a residence in "the west" of some four or five years.

"You who were informed of all our domestic difficulties in which I was involved by my ignorance, when I first came, would be delighted now to see how comfortably I get on. I thought, for some time, it was impossible to have any domestic comfort in the west; but 'impossible,' if not, as Napoleon said, 'the adjective of fools,' is that of imbeciles. I was determined, as far as I could, to make my husband and my children comfortable, and I resigned myself to being a household drudge for the rest of my life.

Household work cannot, as some imagine, be done extempore, nor is there a royal road to domestic economy any more than to any other art or science. I often failed, but I learned from failure as well as from success. Practice made that easy which at first seemed impossible. I can now despatch a bit of work in the time I at first consumed in sighing over it, and I often find my hands are performing their work like machinery, while my mind is wandering over earth, sea, and skies. What a wonder-worker is habit! When we cannot obtain domestics, we do not now suffer. Such occasions are, however, rare. I now know how to direct them. They are well called 'hand;' the employment must be 'head' to them. And now, my dear friend, those branches of my education which, in my first despair, I thought utterly lost upon me, have assumed their right position, and household drudgery takes its subordinate place.

When I know that the material wants of my family are provided for, I devote myself to the intellectual education of my children; and here, far from schools and masters, I pour into their minds the knowledge I acquired in my youth.

Conscious that I do not neglect their domestic education, I feel that I have a right to impart to them my accomplishments; and those accomplishments that, when I first came here, seemed to me a mockery, somewhat like an imperial robe to a wretch starving for bread, are now the solace and delight of my family. Surrounded as you are by all the luxuries of civilisation, I will venture to say that you can have no conception of the enjoyment of a piano in 'the west.' It is a social blessing. I cannot believe that an Italian opera ever gave more genuine delight, than do our little family concerts. Kate plays duets with me on the piano, and my husband accompanies with his flute little Molly's guitar. Of course my girls have had no teacher but myself. You who can see every day fine pictures and engravings, can hardly imagine our excitement, when one of my girls has made an accurate sketch from nature, or copied a wild flower well. As to books, from the Bible, first and best, down to the last periodical which the post brings us, you must be cut off from the civilised world as we are to know their full value. Think what it is, during our long days and evenings of unbroken leisure, to be in intimate communion with such spirits as Milton, Dante, Petrarch, Fenelon, and Cervantes. How often do I bless the education which enabled me to make acquaintance with these authors, and to introduce my children to them.

And now I feel the full value of my late domestic education, which enables me to enjoy, with a quiet conscience, the high and elegant pursuits for which my early instruction alone qualified me."

SIR EDWARD L. BULWER'S POEMS.*

Numerous poetical failures having established the fact that a successful writer of prose, even where a brilliant imagination is one of his admitted characteristics, is not by consequence a good poet, we took up Sir E. L. Bulwer's recent and first unmixed volume of verse, without any positive expectations as to the quality of its contents. We have been much pleased, however, with the work, and, on reflection, conceive it to be such a one as might have been looked for from his very popular pen. The pieces are thoughtful, polished, and epigrammatic; and, as such, will by no means tend to lower the reputation of their author. At the same time, they certainly show his mind to be deficient, on the whole, in "the inspiration and faculty divine," which is often recognisable in the lays that issue from the lowly cot, while unapparent in the emanations of intellects confessedly powerful and tho roughly accomplished. The strains before us are not spontaneous outbursts of feeling, such as flow irrepressibly from the genuine poet of nature, and have their source in an extreme sensibility to her beauties. It is not the daisy by the wayside that awakens the muse of Sir E. L. Bulwer, but an "incident" in some one's memoirs, or a "thought" caught from the stores of the scholar's library. Nevertheless, such as they are, many of his pieces are very beautiful; and this an extract or two will satisfactorily prove.

The following poem seems to us filled with thoughts of a very lofty description:—

THE SOULS OF BOOKS.

Sit here and muse!—it is an antique room—
High-roof'd, with casements, through whose purple pane
Unwilling Daylight stealing through the gloom,
Comes like a fearful stranger.
There THEY reign
(In loftier pomp than waking life had known),
The Kings of Thought!—not crown'd until the grave.
When Agamemnon sinks into the tomb,
The beggar Homer mounts the Monarch's throne!
Ye ever-living and imperial Souls,
Who rule us from the page in which ye breathe,
All that divide us from the clod ye gave!—
Law—Order—Love—Intelligence—the sense
Of Beauty—Music and the Minstrel's wreath!—
What were our wanderings if without your goals?
As air and light, the glory ye dispense
Becomes our being—who of us can tell
What he had been, had Cadmus never taught
To man the magic that embalms the thought—

* Eva, a True Story, and other Tales and Poems, by Sir E. L. Bulwer, Bart. London: Saunders and Otley. 1842.

Had Plato never spoken from his cell,
Or his high harp blind Homer never strung?—
Kinder all earth hath grown since genial Shakspeare sung!

Hark! while we muse, without the walls is heard
The various murmur of the labouring crowd.
How still, within those archive-cells interr'd,
The Calm Ones reign!—and yet they rouse the loud
Passions and tumults of the circling world!
From them how many a youthful Tully caught
The zest and ardour of the eager Bar;
From them how many a young Ambition sought
Gay meteors glancing o'er the sands afar—
By them each restless wing has been unfurl'd,
And their ghosts urge each rival's rushing car!
They made yon Preacher zealous for the truth;
They made yon Poet wistful for the star;
Gave Age its pastime—fired the cheek of Youth—
The unseen sires of all our beings are.

And now so still! This, Cicero, is thy heart;
I hear it beating through each purple line.
This is thyself, Anacreon—yet, thou art
Wreath'd, as in Athens, with the Cnidian Vine.
I ope thy pages, Milton, and, behold,
Thy spirit meets me in the haunted ground!—
Sublime and eloquent, as while, of old,
"It flamed and sparkled in its crystal bound;"*
These *are* yourselves—your life of life! The Wise
(Minstrel or Sage), *out* of their books, are clay;
But *in* their books, as from their graves, they rise
Angels—that, side by side, upon our way,
Walk with and warn us!
Hark! the world so loud,
And *they*, the movers of the world, so still!

All books grow homilies by time; they are
Temples at once and Landmarks. In them, we—
Who *but* for them, upon that inch of ground
We call "THE PRESENT," from the cell could see
No daylight trembling on the dungeon bar—
Turn, as we list, the globe's great axle round,
Traverse all space, and number every star,
And feel the Near less household than the Far!
There is no Past, so long as Books shall live!
A disinterr'd Pompeii wakes again
For him who seeks yon well; lost cities give
Up their untarnish'd wonders, and the reign
Of Jove revives, and Saturn:—At our will
Rise dome and tower, on Delphi's sacred hill;
Bloom Cimon's trees in Academe;†—along
Leucadia's headland sighs the Lesbian's song;
With Egypt's Queen once more we sail the Nile,
And learn how worlds are barter'd for a smile;—
Rise up, ye walls, with gardens blooming o'er,
Ope but that page—lo! Babylon once more!

Ye make the Past our heritage and home;
And is this all? No; by each prophet-sage—
No; by the herald souls that Greece and Rome
Sent forth, like hymns, to greet the Morning Star
That rose on Bethlehem—by thy golden page,
Melodious Plato—by thy solemn dreams,
World-wearied Tully!—and, above ye all,
By THIS, the Everlasting Monument
Of God to mortals, on whose front the beams
Flash glory-breathing day—our lights ye are
To the dark Bourne beyond; in you are sent
The types of Truths whose life is THE TO-COME;
In you soars up the Adam from the fall;
In you the FUTURE as the PAST is given—
Ev'n in our death ye bid us hail our birth:—
Unfold these pages, and behold the Heaven,
Without one grave-stone left upon the Earth!

We wish that our space would permit of a specimen of some of the larger pieces in the volume before us, such as "The Ill-Omened Marriage," "Eva," and "The Lay of the Beacon;" but these are in the shape of stories, and to take a short passage from any of them would be to offer a brick as a specimen of the architectural beauty of a building. We must therefore give another of the smaller pieces, and it shall be one addressed

TO A WITHERED TREE IN JUNE.

Desolate tree, why are thy branches bare?
What hast thou done,
To win strange winter from the summer air,
Frost from the sun?
Thou wert not churlish in thy palmier year
Unto the herd;
Tenderly gav'st thou shelter to the deer,
Home to the bird!
And ever, once, the earliest of the grove,
Thy smiles were gay;
Opening thy blossoms with the haste of love
To the young May.
Then did the bees, and all the insect wings,
Around thee gleam;
Fearless and darling of the gilded things,
That dwell i' the beam
Thy liberal course, poor prodigal, is sped!
How lonely now!
How bird and bee, light parasites, have fled
The leafless bough!
Tell me, sad tree, why are thy branches bare?
What hast thou done,
To win strange winter from the summer air,
Frost from the sun?
"Never," replied that forest hermit lone,
(Old truth and endless!)
"Never for evil done, but fortune flown,
Are we left friendless.
Yet, wholly, nor for winter nor for storm
Doth love depart:
We are not all forsaken till the worm
Creeps to the heart!
Ah, nought without—within thee, if decay—
Can heal for hurt thee!
Nor boots it if thy heart itself betray,
Who may desert thee!"

The polish and beauty of these verses must be admitted by every reader. Sir E. L. Bulwer's volume is characterised by the same graces throughout; and though, as has been said, elaboration is too apparent in these pieces, they assuredly do honour to their author as an accomplished man of letters, if they do not stamp him as of the genuine sons of song.

* Comus. † Plut. in Vit. Cim.

IRISH LABOURERS IN PARIS.

THE following occurs in a sketchy production entitled "France Daguerreotyped":—

"The great multiplicity of labourers required for the fortifications of Paris, and the comparative scarcity of French labourers as compared with the soil which they have to cultivate, occasioned directions to be some time since transmitted to the French consul at Dublin to ascertain whether any disposable number of Irish labourers could be induced to proceed to Paris, with a certainty of procuring regular employment for at least a year to come. The result, as may readily be conceived, was that a number of the 'finest peasantry' jumped at the offer as nimbly as a salmon-trout at a summer fly. Under the special superintendence of the consul, they were shipped in disorder and ragged condition for Havre, felicitating themselves on the gentility of the excursion, and the unlooked-for opportunity of 'makin' the *tower* to France all as one as the foremost quollity—and that upon *vilvit*, and be paid for their pleasurin' into the bargain!' Since the memorable period when the immortal hero of the gridiron, 'bein' in distress in regard of the 'aitin', thought a solitary '*Parley voo Fransay?*' a passport to all the mysteries of the French mind, nothing more *bizarre* and provocative of laughter has been witnessed than the landing of these stray sons of St Patrick at Havre, and their journey on foot to Paris. It was my lot to meet with one of them in the centre of the Palais Royal, at the magnificent Galerie d'Orléans. There he stood beneath the splendid glass roof, reflected in a hundred mirrors along the walls, stared at by scores of mustachioed loungers, and giggled at by a dozen *magasin-grisettes* in their exquisitely *soigneuses* toilets, looking like houris in a paradise. Paddy had changed in no respect the costume of his native hills. The corduroy smalls were patched and repatched, yet broken at the knees. The buttons enjoyed a sinecure 'for convaynience;' the long strings which held the place of knee-buckles fluttered down to the ankle. Like Lord Hamlet, he appeared in the midst of that emporium of fashion

—'With his doublet all unbraced,
No *hat* upon his head,'

but a very stunted and straw-bound *caubeen*, with the immemorial short and blackened pipe stuck on the dexter side; and to complete the parallel, Pat had

—'His stockings fouled,
Ungartered, and down gyved to his ankle.'

When to this I add that his hardy and sinewy leg was thickly matted with hair of a dusky hue, and that his face was bespread with some ten days' growth of beard of a foxy-brown colour; that his brogues, loosened by the journey, were made fast around the instep by hay ropes; that his coat was of aboriginal blue frieze; and that in his hand he wielded a stout 'alpeen,' which had been his firm support for many a rood—I need scarcely wind up his resemblance to the Danish prince by saying that he was 'the observed of all observers!' When I first espied him in that attitude of upward gazing, which, according to philosophers, distinguishes man from the beast (a distinguishing characteristic which is sometimes very requisite), I drew closer to him, impelled by an irresistible curiosity, and was no little astonished at hearing him ejaculate, 'Holy Vargin, if that disn't bang Banagher. Eh, then, *it's with glass they thatches their houses in Paris!*'"

A JOB FOR YOUNGER SONS.

THE following quiz on the difficulty of finding situations for younger sons, is from a series of clever papers in the "Dublin University Magazine:"—

"Douglas Jerrold, in his amusing book, 'Cakes and Ale,' quotes an exquisite essay written to prove the sufficiency of thirty pounds a-year for all a man's daily wants and comforts—allowing at least five shillings a quarter for the conversion of the Jews—and in which every outlay is so nicely calculated, that it must be wilful eccentricity if the pauper gentleman, at the end of the year, either owes a shilling or has one. To say the least of it, this is close shaving; and as I detest experimental philosophy, I'd rather not try it. At the same time, in this age of general glut, when all professions are overstocked—when you might pave the strand with parsons' skulls, and thatch your barn with the surplus of the college of physicians; when there are neither waste lands to till and give us ague and typhus, nor war to thin us, what are we to do? The subdivision of labour in every walk in life has been carried to its utmost limits: if it take nine tailors to make a man, it takes nine men to make a needle. Even in the learned professions, as they are called, this system is carried out; and as you have a lawyer for equity, another for the Common Pleas, a third for the Old Bailey, &c., so your doctor, now-a-days, has split up his art, and one man takes charge of your teeth, another has the eye department, another the ear, a fourth looks after your corns; so that, in fact, the complex machinery of your structure strikes you as admirably adapted to give employment to an ingenious and anxious population, who, until our present civilisation, never dreamt of morselling out mankind for their benefit.

As to commerce, our late experiences have chiefly pointed to the pleasure of trading with nations who won't pay their debts, like the Yankees. There is, then, little encouragement in that quarter. What, then, remains, I scarcely know. The united services are pleasant, but poor things by way of a provision for life. Coach-driving, that admirable refuge for the destitute, has been smashed by the rail-roads—and there is a kind of prejudice against a man of family sweeping the crossings. For my own part, I lean to something dignified and respectable—something that does not compromise 'the cloth,' and which, without being absolutely a sinecure, never exacts any undue or extraordinary exertion—driving a hearse, for instance; even this, however, is greatly run upon; and the cholera, at its departure, threw very many out of employment. However, the question is, What can a man of small means do with his son? Short whist is a very snug thing, if a man have natural gifts—that happy conformation of the fingers, that ample range of vision that takes in every thing around. But I must not suppose these by any means general, and I legislate for the mass. The turf has also the same difficulties—so has toad-eating—indeed, these three walks might be included among the learned professions.

As to railroads, I'm sick of hearing of them for the last three years. Every family in the empire has at least one civil engineer within its precincts; and I'm confident, if their sides were as hard as their skulls, you could make sleepers for the whole Grand Junction by merely decimating the unemployed.

Tax collecting does, to be sure, offer some little prospect; but that won't last. Indeed, the very working of the process will limit the advantages of this opening—gradually converting all the payers into paupers. Now, I have meditated long and anxiously on the subject, conversing with others whose opportunities of knowing the world were considerable, but never could I find that ingenuity opened any new path, without its being so instantaneously overstocked that competition alone denied every chance of success.

N.B.—I have just read over the preceding to my old friend Mr Synnet, of Mulloglass, whose deep knowledge of the world makes him no mean critic on such a subject. His words are these:—

'There is some truth in what you remark—the world is too full of us. There is, however, a very nice walk in life much neglected.'

'And what may that be?' said I, eagerly.

'The mortgagee,' replied he, sententiously.

'I don't perfectly comprehend.'

'Well, well! what I mean is this: suppose, now, you have only a couple of thousand pounds to leave your son—maybe you have not more than a single thousand—now, my advice is, not to squander your fortune in any such absurdity as a learned profession, a commission in the line, or any other miserable existence, but just look about you, in the west of Ireland, for the fellow that has the best house, the best cellar, the best cook, and the best stable. He is sure to want money, and will be delighted to get a loan. Lend it him; make hard terms, of course. For this—as you are never to be paid—the obligation of your forbearance will be the greater. Now, mark me; from the day the deed is signed, you have snug quarters in Galway, not only in your friend's house, but among all his relations—Blakes, Burkes, Bodkins, Kirwans, &c. to no end; you have the run of the whole concern—the best of living, great drink, and hunting in abundance. You must talk of the loan now and then, just to jog their memory; but be always 'too much the gentleman' to ask for your money; and it will even go hard but from sheer popularity they'll make you member for the county. This is the only new thing in the way of a career I know of, and I have great pleasure in throwing out the suggestion for the benefit of younger sons.'"

ETIQUETTE OF SPANISH MONARCHS AT TABLE.

At the principal festivals of the year, for example, at Easter, their majesties are accustomed to eat in public, on which occasions, with respect to the queen, the following is to be seen and done. The master-cooks set out the table under a canopy, cover it, place the requisite vessels, and spread over all a second cloth. First, there proceed three detachments of the royal body-guard, the sceptre-bearers with their silver and gilded sceptres, the upper intendant of the household and the gentlemen pages, all, except the intendant, bare-headed. As soon as the viands are placed, after the direction of the intendant, the queen is informed, who then appears with her ladies, and takes her seat. A chaplain now comes forward, who blesses the meal, and is commonly presented by the queen with a portion of the best dishes. Company is then admitted to see the queen, but not beyond a stated number, nor of every description. A lady lifts the cover from a dish, a second points it out to the queen, a third lays it before her, except the queen by a slight sign of her head reject it. Commonly, fifteen dishes are served up, besides the entrés and the dessert. The ladies, usually fair and attractive, carry over the shoulder very clean napkins, and conduct themselves very adroitly in their service. If the queen requires any thing to drink, for example, she makes a sign with her head to the first lady, who makes a sign to the lady of the cups; the lady of the cups nods to the chief intendant; the chief intendant to one of the gentlemen pages; and after the sign is made, all make low obeisances to the queen before they pass on the signal. The chief intendant, the page, and an intendant, go to the door; the first receives from the cellar master a large crystal goblet, and holds it with the right hand, and with the left a gilded salver. He returns with the intendant and the page to the lady of the cups, and gives her the goblet and salver. Both advance to the queen with the page, kneel, and offer her to drink. Nothing of the above ceremonial is ever omitted—the presentation of goblet, salver, or glass, the particular mode of taking off and putting on the cover, and of putting every thing back in its place. The proceeding is the same with the dessert and the washing, when the table is removed. The nobles who are present, but not on service, stand at one side of the room, and converse with the ladies as they do with their lovers. Those on service only make low bows, and oggle from a distance. The proceeding is the same when the king eats in public. If he does so the same time with the queen, the attendance and ceremonies are doubled, to the great contentment of the spectators.—*Raumer's History of 16th and 17th Centuries.*

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row.

Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

THE LITERARY PROFESSION.

THE Literary Profession is a wide term. Some one has remarked that there is a ludicrously great disparity between the undermost and topmost of what are called the learned professions—as, between the poor village apothecary and Sir Henry Halford, between the rural pettifogging attorney and the Lord Chancellor, and the humble hedge-parson and the Archbishop of Canterbury or the Pope. It will be acknowledged that there is quite as great a space and as ludicrous a contrast between the village rhymer and Wordsworth, or between the scribbler of stringent letters on small police matters in a country newspaper and the editor of one of the principal reviews. The subject placed at the head of this paper must certainly be considered as a very large and very various one, and therefore not easily to be treated to any purpose in a short space. We, nevertheless, are hopeful of making a few general remarks, which will tell on the cases of many individuals, and help, perhaps, to correct some loose and ill-founded notions of the public mind respecting the profession of the pen.

One great distinction amongst authors now, as amongst authors a hundred or two hundred years ago, is into men of fortune who write from other motives than the desire of making a subsistence, and men of no fortune with whom that is necessarily one of the leading motives of exertion. The first class are to be regarded as amateurs: they are to be praised for their absolute merits, and allowed credit for selecting so elegant a mode of amusing their leisure hours, but they do not in any way affect the condition of the rest. Setting them aside, and considering those only who have looked to letters as a means of gaining a subsistence and advancing themselves in the world, we are struck at the outset by this, that many of them have really attained these objects in an eminent degree. The prevalent notion, amongst many literary men and the public alike, is that of Master Shallow as to his class—"Beggars all, Sir John;" but this is surely a great mistake. We are not aware of a single one of the conspicuous literary men of England of our time, who has not had reason to thank his pen for what it has done for him. Indeed, the literary has been scarcely behind the legal profession during the last age, in respect of the cases of advancement from one grade of society to another which have been achieved by it. Its young adventurers have not secured any peerages, and not very many baronetages or knighthoods; but its disadvantage in this part of the contrast is from a mere formal cause affecting the legal profession. Great lawyers necessarily come into great political situations, in which these honours are matters of course. Great authors are perhaps as well with their honoured names uneclipsed by titles, and the universal esteem in which they are held when their morals are not unworthy of their fame. We have only to run over some of the principal names, and to reflect on the histories connected with them, in order to be assured that the case is as here represented. Sir Walter Scott entered life as the son of a Scottish solicitor, and promised to be nothing better than a sixth-part employed barrister, till his pen brought him place, fortune, and title: had he not unfortunately involved himself in business affairs—for which his original motive was a dread of the precariousness of literary gains—had he trusted, in short, to literary gains alone, he must have died a man worth a hundred thousand pounds, and made good his wish to found a landed and titled family. Mr Campbell, as is generally known, was an unfriended youth studying at a Scottish university, with perhaps only the life of a poor teacher or preacher before him, when his first poem obtained for him friends and fame. He has not perhaps realised wealth, but he has always lived in the style of a gentleman, and moved in the highest circles of society. Messrs Wordsworth and Southey are not remarkable for the gains they have made by literature; but they have been at least able to live as gentlemen, in the indulgence of all their peculiar tastes, especially the love of nature and the love of study, which are just the tastes of all others now-a-days least within the power of men who are not entirely independent. If we are not mistaken, Mr Moore has been raised in fortune by the aid of his muse. It was said, a few years ago, that he enjoyed L.500 per annum on account of one portion of his writings alone; and he has since been endowed with a pension of L.300, the express fruit of his literary merit. The English Tibullus may not be rich; but, amongst the various fates of the sons of Dublin citizens, there are worse than that of enjoying a moderate competency, with the society of the most refined part of the first nation upon earth. Mr Washington Irving was originally a merchant, and did not succeed in business; he devoted himself to letters, and it was only the other day that he attained, unquestionably in consequence of literary distinction, the office of his country's ambassador to Spain. Mr Jeffrey has, we believe, no reason to regret his critical writings. His birth and original prospects were not superior to those of Scott. He is now a man of large fortune, and a judge, fully as much through his literary celebrity as any thing else. The editor of the opposite critical organ is the son of a Scotch clergyman, a respectable degree in society, but not one which endows its children with much fortune: to him literature has given large income as well as personal importance. It is no discredit to him to say that he would have remained comparatively poor, as well as obscure, in his original profession. His early associate, Mr Wilson, has been not less indebted to his literary talents for station and income: let the horde of "the unemployed" who daily pace the Parliament House in Edinburgh, bear witness. Within the last few years we have had an extraordinary example of a rise in affluence and consideration in consequence of literature, in the person of Mr Dickens. Society sees few revolutions in personal fortune greater or more rapid than that which this most meritorious person has passed through since 1836, when he published his first sketches in the Morning Chronicle. He walks the world more in the manner of a Roman conqueror than any man since the days of Rome. Look, again, to Sir Edward Lytton Bulwer—novels written probably in a few weeks, paid at the rate of fifteen hundred pounds each—political arising from literary distinction—a baronetcy! Are these things significant of a miserable profession? In short, it appears that literature, far from being necessarily associated with vexation and penury, is entitled to take no low place amongst the means by which talent raises itself in the world. Nor has it ever been otherwise since there was a printed literature in England. If we look back over the list of those who were more particularly dependent on their literary abilities, we shall find that there have been at all times men rising to opulence, or at least comfort, and to personal distinction, by these means. The position of Johnson, after his early struggles were over, was not an unenviable one. Hume, from almost nothing, raised himself by his writings to considerable wealth, and to high offices which brought him more; so that he died in the enjoyment of a thousand a-year, and left fifteen thousand pounds. Pope got wealth by his muse, and Swift attained to considerable ecclesiastical preferment, though not to what he aimed at—a bishopric. Addison rose to be Secretary of State; and Prior, from a pot-house boy, became, like Irving, an ambassador. Dryden, with such fecundity of brain as he possessed, must have been well enough off, but for the silly woman who called him husband. We do not know much of rare Ben, but may surmise that sottish habits alone prevented him from being a rich fellow enough. In Shakspeare, elevated from a woolstapler's son to absolute fortune and the style of a country gentleman, we have a striking case of advancement by means of literature, for certainly it was mainly through that cause that he attained wealth, seeing that his qualifications as a player were so poor. We stop with Spenser, who may be thought an unfavourable instance, as he died in distress; but we are not satisfied that this distress was connected in any way with his poetry. Elizabeth employed, patronised, and endowed him, and that grant of land in the south of Ireland must have been no small matter. It was only a transient disturbance of the peace of the country which damaged the poor poet's spirits, and brought him to his grave. Probably, if he had survived the confusion for a little, all might have been well with him.

When we consider these things, it is difficult to account for the tendency which is every where shown to whine about the poor rewards of literature, and the doom of indigence and starvation which hangs over the heads of all who give themselves to pen and ink. Can it be owing to the actual known instances of poverty-struck scribblers and starved poets? No doubt, some men of letters have come to a miserable end. The mind lights in a moment on Chatterton, Savage, and Otway. But are these casualties not to be found in all ranks of men and all professions? Are there not many starved apothecaries? Are there not many miserably poor solicitors? Has not the church also its army of martyrs—curates steeped in poverty, and poor probationers who live upon protracted hope all their days? We do not hear of these men, but we always hear of unfortunate authors; and hence perhaps the notion that misery is the almost exclusive associate of genius. It is also to be observed that many of the mishaps and sad ends of literary men are to be traced to their own imprudence—that thing of power, which nothing can overcome or gainsay. When any of the ordinary children of men happen to be destitute of a sense of the value of money, and consequently spend in one day what they gain in six, they usually go to wreck. It were unreasonable to expect that men of genius are to be exempted from the same rule. Goldsmith lived in difficulties, and died three thousand pounds in debt; but Goldsmith was a prosperous and well paid author. He might have been comfortable, if he only could have used his gains with common discretion. There are many literary men in the present day whose case is precisely the same. They realise for years a large income; they live beyond it; they get into debt and difficulty; and then, perhaps, they join in the cry about the inadequate rewards of the press and the woes of literary men. Every person of common feeling would deplore the poverty and difficulties of such men, and be disposed to judge lightly of the cause for the sake of the talent and the suffering; but every one must at the same time be sensible that the evil could have only been avoided by one thing, the exertion of a rational degree of prudence, and that it is unreasonable for literary men to expect a reversal of the laws of nature in their case. We remember a ruined spendthrift who used to talk loudly of the sad state of the money market, and how the country was going all to

perdition: the class of self-impoverished literary men can be at no loss to make the application.

Perhaps it is partly owing to the poverty cry, and the notable imprudence of many literary men, that a certain stigma is attached by the public to the profession in the mass; that is to say, to all except the few who attain to an overbearing degree of fame and wealth. Something also may be attributed to the novel and as yet unclassified predicament of the profession. From whatever cause, there is certainly a disposition in our commercial community to look down a little upon men who are understood to depend for subsistence upon some of the more strictly useful branches of literature. This is a sad case for the literary profession, for nineteen-twentieths of it is composed of the useful class of writers. These, we think, may be divided into the writers of controversial politics in newspapers, the conductors of and contributors to literary and critical periodical works, and those who employ themselves in modifying human knowledge in new book shapes, or, briefly, compilers. Now, it would, we think, be difficult to show any thing absolutely mean or wrong in any of these modes of employing an able and educated mind. The labours to which such men address themselves are labours which the public requires as much as it requires the services of any other profession whatever. How should it be respectable to write letters on law-business at a fee of six-and-eightpence for each, and not respectable to pen one's opinions on a political transaction, or to criticise a book, or write a paper of amusement, or gather some kind of knowledge from a number of places in which it is widely scattered into a volume where it will be comparatively accessible? The public service is concerned alike in these various ways of making a livelihood. Literary men of the class described seem to us comparable to teachers and artists. The power of writing agreeably in the belles lettres may be ranked amongst the fine arts: and to the fine arts no disreputable idea is attached. Writing in the critical, controversial, and generally instructive walks, is much like the business of a preacher or a barrister—to which professions the public imputes nothing but honour. Why, then, should a useful writer in these departments be in any way sneered at or held lightly? Clearly, we think, he ought not to be so on account of his profession, as long as labour in general is not held to infer disgrace. The public sentiment on this subject calls for correction, and correction it will no doubt get in good time, as ordinary society becomes more accustomed to see men living by literature But certainly it would contribute much to this end, if literary men themselves adopted more correct views as to their position and destiny, and sought to dignify their profession by their individual conduct.

The profession of letters is one to which no man is regularly bred; and this is unavoidable, for it requires a range of qualities which no one can be calculated upon beforehand as possessing. It is recruited, for the most part, by individuals who, after attempting some other profession with little success, and finding a natural vocation to this, are induced to change from the one to the other. This is quite a proper course: by all means let a youth try some of the regularly established professions, and make his best endeavour in it; and let the shift of object only take place on mature consideration of its being the most advisable step. But supposing that the literary career is at length determined on, the aspirant will, we believe, save himself much future uneasiness, and be best likely to attain his end, if he considers himself, as other aspirants are obliged to do, simply as a man who must labour that he may eat. He should see fully that he has a life of exertion before him, and address himself to it with all the coolness and energy of a man of the world. He will be eager to employ his faculties in some of the higher walks of the art—he will have an epic or a tragedy in his head, and long to get it produced; but it is for the wealthy amateurs to rush to these efforts—*he* must meanwhile eat, and to eat he must work at something which is pretty sure to bring money. We do not, indeed, see how it can ever be in the power of a literary adventurer to follow out his own fancies, while the world continues to be constituted on the principle that meat and drink are only to be got for coin. He must, then, it is clear, be industrious. There are other things which he must consider well; in particular, he must have a just sense of what he is. He is a useful labourer or artist. Now, there are various degrees of skill to be exerted in all kinds of labour, and a useful labourer is likely to be estimated, moreover, according to the regularity and conscientiousness shown in his general conduct. He has probably at first to look to some one for employment. How surely, in such circumstances, are his interests to be advanced, if he takes care to improve the value of his grand instrument or tool, his mind—to inform it by all serviceable knowledge, and keep it clear and bright, instead of dimming and dissipating its powers by folly and frivolity; if, also, he endeavours on all occasions to take a steady view of the duty expected from him, and perform it with punctuality, and to the wishes of his employer. It is the ruin of many literary men that they are wayward and irregular; that they will not execute tasks in the way expected or desired, but in some capricious way of their own; and that, entering the profession with only perhaps a common classical education, they never seek to acquaint themselves with any of the branches of knowledge now most prominent, so as to be able to write about any of the great questions of the day. Ignorant, unsteady, inefficient for contemplated ends—with the one quality alone of cleverness—how is it to be expected that they are to succeed? A literary man should regard a certain range of the physical sciences, political economy and philosophy, and an acquaintance with history and the literature of at least his own country, as part of a stock necessary for his trade, which he should employ every spare hour in acquiring. He should reflect that with his employer the produce of the pen is a matter of business, which must be managed on business principles—dispatch, regularity, sufficiency in point of quality—and it should be his endeavour to act accordingly. A literary artist thus accomplished and qualified, need not fear fortune. He could not fail, in a country like this, to ascend rapidly. We can say, with all the confidence of personal experience, that so far from employment being wanting for such men, there is only a want of the men for the employment. In reality, the literary employés of this country are a large body of men. It is a body in which there is as good a chance of promotion, in accordance with qualification, as there is in any other profession. Those who are at once able, steady, and skilful, unavoidably go upwards, while those who are the reverse, or who with ability want some of the other requisite qualities, remain below. There is, however, a general impression amongst those who have to employ literary men, that as a body they are deficient in an inclination to address themselves steadily to the duties prescribed to them. And this is just one of the points in which some reform amongst the gentlemen of the press is called for. It is a failing which we of course are anxious to think of with tenderness; but we are at the same time sensible that it exists, and that its existence is the cause of much of the misery which befalls literary men.

Even while the literary adventurer remains as an employé, he may, by a careful husbanding of his gains, do much to secure his independence. He is in this respect fully as well off as any other class of men with similar incomes; and, like most other persons, he will be apt to find that to be always nakedly poor is the surest means of continuing poor. On the contrary, with something in his pocket, he will be able to make moves and changes that may be expected to redound to his advantage. In fact, on this will partly depend his advancing to some of those higher positions of his profession in which ease and affluence are secured, and the ability at length attained to follow out some of the favourite projects of his *inner mind*, so as to crown his name with real fame. It is not desirable that he should give himself to money-making, or become a niggard. But it is certainly most desirable that he should seek to be independent by all honourable means, as a point essential not only to his respectability as a citizen, but to the proper, untrammelled, unembarrassed exercise of those mental gifts which have given direction to his course in life, and are his own and his children's bread. We think the warning the more necessary, as it happens to be just one of the most besetting inclinations of all literary men who prosper a little, to launch into extravagances which in the long run enslave and degrade them. A dignified simplicity of life, with a reasonable regard for the future, would be, in connexion with a well-earned literary reputation, something which the most thoughtless might pause upon and contemplate with pleasure.

By presenting these plain common-sense views of the condition and duties of literary men, we believe we are doing more for their genuine interests than if we only indulged in sentimental wailings over the hard fate of genius. The lachrymose vein has been much in vogue of late, during the progress of the Copyright Bill. So far has it been carried, that one particularly luminous writer endeavours to show that few men of literary celebrity have left descendants; a bad recommendation, we should think, of a statute which only promises something for the posterity of authors. Since that bill is passed, we would only remark upon it, that it would be a great pity if literary men do not endeavour to make as much of its benefits as possible come to their own families, instead of the great publishing houses. Supposing present practices to be continued, it will only be describable hereafter as a burning down of the house of the public to roast the eggs of a few authors peculiarly situated; for, the booksellers being the chief owners of copyrights, the only change in general will be that these, instead of being thrown open to all for the public benefit, will be kept up as monopolies by the gentlemen of Paternoster-row. But if we are to see a time when literary men will act a more prudent part, and endeavour to retain their copyrights in their own hands, the measure will be productive of benefit to that class. That such may be the case is our most earnest wish; and so we shake hands with our literary brethren, and bid them a kind farewell.

DOUBTFUL AND FABULOUS ANIMALS.

THE KRAKEN.

Among the various animals whose existence is as yet doubtful or positively fabulous, the first place may be assigned to the creature usually termed the *kraken*, a fish of enormous size, but differing from the sea-serpent, another huge denizen of the ocean, of which we formerly presented some account (No. 382). The kraken, if the evidence now to be adduced on the subject entitles us to speak of it as a thing of reality, would appear to be a kind of cuttle-fish, possessing long arms, or tentacula, with which it seeks for and grasps its prey. It seems to be the animal alluded to by Milton, as that

> "which God of all his works
> Created hugest that swim the ocean stream.
> Him haply slumbering on the Norway foam,
> The pilot of some small night-founder'd skiff,
> Deeming an island oft, as seamen tell,
> With fixed anchor in his scaly rind,
> Moors by his side under the lee."

According to Norwegian writers, the kraken appears occasionally on the surface of the water in calm weather, stretched out far and wide like a floating island, and exhibiting many enormous arms at all parts of its circumference. The numerous accounts given of it differ as regards its actual size; but most writers describe it as about a quarter of a mile in diameter, and as covered on the back with sea-weeds. After remaining some time in the sun, it is said to sink slowly, causing a great eddy in the waters.

The accounts of these authors are in such a style as to betray great exaggeration, and any thing but an anxious investigation of evidence. But we must try to sift the real from the unreal. Bishop Pontopiddan states that the fishermen of Norway, when out at sea on summer days, "often find but 20 or 30 fathoms of water, where they knew they ought to have had 80 or 100 fathoms. At these places they generally find the greatest quantities of fish, especially cod and ling. Their lines, they say, are no sooner out than they may draw them up with the hooks all full of fish. By this they judge that the kraken is at the bottom." The bishop then goes on to say, that experience has taught the fishermen to fly the instant that the water grows shallower. From a safe distance they then behold "the enormous monster come up to the surface of the water; he there shows himself sufficiently, though his whole body does not appear. Its back or upper part, which seems to be, in appearance, about an English mile in circumference (some say more, but I choose the least for greater certainty), looks at first like a small number of islands, surrounded with something that floats and fluctuates like sea-weeds. At last, several bright points or horns appear, which grow thicker and thicker the higher they rise above the surface of the water; and sometimes they stand up as high and as large as the masts of middle-sized vessels. It seems that these are the creature's arms; and it is said, if they were to lay hold of the largest man-of-war, they would pull it down to the bottom." By and by, the monster sinks with a great eddy; and the bishop adds, that it possesses or emits a peculiar scent which attracts fish to feed its unwieldy vastitude.

The most remarkable characteristic of the creature here described consists in its enormous *arms*, distinguishing it at once from the whale or any of that genus. A similar creature is described by Pliny as having been found in the gut of Gibraltar. He states it to have been "provided with vast *arms*, so widely spread out as to impede the navigation of the straits." A more modern writer, Paulinus, confirms, in every respect, the account of Bishop Pontoppidan, on the authority of Ambrosius Rhodius, professor in the University Christiana in Norway, and a man of "superemineut trustworthiness." That gentleman related, that, near the castle of Wardchuss, on a calm day, an immense monster made its appearance on the surface of the ocean. "Its circumference was so great that a troop of horse might easily exercise on its back." It lay long with its back exposed to the sun, like a rock covered with weeds, and then sunk gradually out of sight. From its long arms, it was called a Herculean crab; and the fishermen said that if boats approached closely to it, they were seized and submerged by these expanded feelers. Another writer, Olaus Magnus, alludes to the same immense

animal; and mentions that an early British bishop, named Brendanus, being on an episcopal peregrination to the north, came with his companions to an island, as they deemed it, on which they were tempted to land and kindle a fire. The island, however, quickly began to descend, and the bishop and his friends escaped with difficulty, made aware that they had been on the back of a living thing. But, passing over such testimonies, which remind one very much of the stories of Sinbad, let us come to a more direct species of evidence. In the year 1680, an occurrence took place, of which an authenticated account was drawn up by the Rev. Mr Früs, minister of Bodoen in Nordland, and vicar of the college for promoting Christian knowledge. Into a strait between rocks, in the parish of Alstahoug, an animal of great size was found to have entered, and there to have entangled itself. It had arms of great length and strength, and these were wound among some trees hard by, while the body, also, was so fixed by projections of the rocks, that the creature could not work itself out, but perished and putrified on the spot. Such was the length of time which it took to decay that the whole channel was rendered impassable by the fœtor. Large though it was, this animal was held to have been young, as, when advanced in years, they appear seldom to move, and perhaps cannot move far from one spot.

Such being the accounts which we have of the kraken, the question arises—"What foundation may there be for them, and is there any existent creature really approaching this alleged magnitude?" To speak frankly, we think it cannot be doubted that there is some such animal, though its proportions have been monstrously exaggerated. The cuttle-fish, long called a polypus, agrees with the kraken with respect to its arms or tentacula, and is authentically known to reach a great size. Pennant, in speaking of this animal, mentions that specimens of it have been seen in the Indian seas measuring two fathoms in breadth across the central part, with eight powerful arms, each nine fathoms in length. Shaw observes—"The existence of some enormously large species of the cuttle-fish tribe in the Indian and northern seas can scarcely be doubted; and though some accounts may have been exaggerated, yet there is sufficient cause for believing that such species very far surpass all that are generally observed about the coasts of European seas." Shaw then alludes to the case of Captain Dens, a modern navigator, who lost three men by such a monster in the African seas. As this case is very curious, we subjoin an account of it, abridged from the French of Denis Montfort, a writer who collected various instances of the same kind.

To Denis Montfort Captain Dens related, that while between the island of Saint Helena and the Cape of Good Hope, in about the 15th degree of south latitude, his vessel was becalmed for several days, and he resolved to profit by the occasion to clean the ship. For this purpose several planks, suspended by cords, were let down from the sides of the deck, and several of the men took their station there to perform the work. They were so engaged when one of those monsters, called by the Danes *ankertrolds*, rose suddenly from the deep sea, and, casting one of its arms around two of the men, drew them in an instant with their scaffolding into the sea. Next moment a second arm was thrown around another of the men, but he had sprung up to the strong ropes, and the monster, enclosing these, could only crush him, while he emitted the most piteous cries. Meanwhile, the crew had rushed to his aid. Some began with knives and axes to cut asunder that terrible arm which encircled him, while others launched harpoons into the body of the animal. The man was freed, and it then became the good captain's strenuous endeavour to recover the two other men. Five harpoons were in the creature's body, as, with its prey, it sought to descend again into the deeps of the sea. The harpoon-lines were allowed to run out in part by the captain's orders, and then he ordered them to be drawn back. This brought the monster a short way up; but it soon resisted, and too successfully. Four of the harpoon-lines broke, and a fifth harpoon came out of the body, leaving the unfortunate victims with their captor. In addition to this sad loss, the man who had escaped died through the night, rather from a delirium of terror than from his injuries, though these were severe. The head of the monster had not been seen, and but a part of its body; but that part of the arm which had been cut off measured twenty-five feet in length, and was as thick at the base as a mizen-mast. The length of the whole limb must have been much greater—probably, as Captain Dens thought, from thirty-five to forty feet.

A case similar to this is illustrated by a picture in the chapel of St Thomas at St Malo, placed there by a ship's crew in remembrance of their preservation off the coast of Angola. An enormous cuttle-fish had grasped their whole vessel in its arms, and was on the point of dragging it to the bottom, when, by the most desperate exertions, the sailors timeously succeeded in hewing off the members which were hauling them to destruction. In their extremity they had vowed vows to St Thomas, and the picture is a memorial of these.

This colossal cuttle-fish as yet remains undescribed by zoologists, for it has never been accurately observed. Admitting that it exists, we can easily conceive how the imaginations of the few mariners and others who have seen it might expand its actually large body into a bulk far beyond what are, to us, the bounds of probability.

THE LIFE AND POETRY OF CATULLUS.

Caius Valerius Catullus was born either in the town or territory of Verona, 87 B.C. He was sprung of rich and honourable parents. This appears from the circumstance that Julius Cæsar, when in the north of Italy, usually resided at his father's villa. When the poet afterwards attacked him in some satirical verses, he had the good sense or the magnanimity only to revenge himself by asking him to supper. Perhaps his old regard for the father might plead for leniency in his treatment of the son.

While yet a youth, Catullus was invited by Manlius Torquatus to Rome. The dissolute life which he there led made serious inroads on his hereditary possessions. We next find him accompanying to his province of Bithynia the Prætor Memmius, a distinguished patron of literary men. This was a common expedient, among the Roman youth, for repairing a dilapidated fortune; but in the case of Catullus it seems to have failed. He returned to his country no richer than he left it; and brought back with him a constitution enfeebled by debauchery, and a heart at once galled by disappointment and saddened by the loss of a favourite brother. His protestations of indigence must, however, be understood as only relative to the luxurious ideas of the circle in which he moved. Besides meeting the expenses of a town life, his income was always adequate to the maintenance of two splendid country mansions. His station in society, combined with his genius, naturally introduced him to the acquaintance of the most eminent men of the day, at the head of whom may be placed the illustrious Cicero. From a passage in one of that philosopher's epistles, some have concluded that the account which refers the death of Catullus to 57 B.C. must be erroneous; and that he survived at least sixteen years longer. According to the one authority, he died at the early age of thirty; according to the other, he reached that of forty-six.

Catullus has left a single book of poems, which opens with a dedication of the collection to the well-known historian Cornelius Nepos. It is difficult to classify the various pieces of which the little volume consists. Some are lyrical, some elegiac, some epigrammatic; three are epithalamia; and some cannot well be referred to any recognised class whatever. They are mostly imitations, in some cases versions, from the Greek, in which language Catullus was a proficient. The celebrated translation of the Sapphic ode is perhaps the most perfect specimen in existence of transfusion of the spirit of one language into another. Catullus was the first who introduced the lyric measures of Greece into Latin versification. This he has effected with incomparable skill. No ruder hand could have transplanted a flower so fragile, without soiling its purple or perilling its fragrance. It is matter of deep regret, however, that so far as the great majority of these compositions are concerned, we must restrict the term *delicate* to the style (and it never could be more appropriately applied), and select for the sentiment its strongest possible antithesis.

We begin our selections with the exquisite twin poems on Lesbia's sparrow. This lady's real name was Clodia; and when the reader is informed that she poisoned her husband, he will be able to rate at its due value her display of sensibility on the death of her feathered favourite. The versions to which no name is affixed have been prepared by the writer of the present article.

TO LESBIA'S SPARROW.

Lesbia's darling! pleased she,
Dainty sparrow, toys with thee;
Tender lulleth thee to rest
On her white and heaving breast;
Or provokingly incites,
With finger-tip, thy tiny bites;
Whilst to win her beaming smiles,
Thou hast thousand nameless wiles,
Cheating her of half the languish
Bred by love's delicious anguish.
Oh! could I like solace gain,
So might sleep my amorous pain:
Grateful as the golden fruit
To the maiden fleet of foot,
Winning love's oft-slighted plea—
Were that solace soft to me.

The legend here alluded to is that of Atalanta—a royal maiden noted for swiftness in running, who, wishing to get rid of the importunity of her suitors, declared her determination to accept none but the man who should outstrip her in the race. Failure was to forfeit the life of the competitor; her hand was to be the reward of success. Several ventured, were defeated, and suffered the penalty. One youth, named Hippomenes, at last won the fair prize by stratagem. Dropping, one after another, three golden apples, procured by Venus from the garden of the Hesperides, the virgin, fascinated by their beauty, stooped repeatedly to lift them, and thus allowed her lover to get ahead of her.

The composition which pairs with the preceding has been often imitated by the earlier French poets, as also by one or two of the classic writers. It is a model of delicacy and tenderness.

ELEGY ON THE SPARROW.

Each Love, each Venus, mourn with me;
Mourn every son of gallantry!
The sparrow, my own nymph's delight,
The joy and apple of her sight,
The honey-bird, the darling, dies,
To Lesbia dearer than her eyes!
As the fair one knew her mother,
So he knew her from another;
With his gentle lady wrestling,
In her snowy bosom nestling
With a flutter and a bound,
Quiv'ring round her and around;
Chirping, twitt'ring, ever near,
Notes meant only for her ear.
Now he skims the shadowy way,
Whence none return to cheerful day.
Beshrew the shades! that thus devour
All that's pretty in an hour.
The pretty sparrow thus is dead;
The tiny fugitive is fled.
Deed of spite! poor bird! ah! see
For thy dear sake, alas for me!
My nymph with brimful eyes appears
Red from the flushing of her tears.

—*Elton's Version.*

The point and terseness of the two performances which we next present, constitute them instances of the proper epigram. In the first of these light effusions, Catullus contrasts with his mistress a more brilliant and fashionable charmer. The reader will anticipate the decision. To discover "Helen's beauty in a brow of Egypt," is no strange exertion of Love's second-sight. "Could we call up in array before us all the beauties whom the love of poets has immortalised, from the high-born dame to the plebeian damsel—from the Lauras and Sacharissas down to the Chloes and Jeannies—we should, it is to be feared, sadly unpeople our imaginations of many a bright tenant that poesy has lodged there; and find, in more than one instance, our admiration of the faith and fancy of the worshipper increased by our discovery of the worthlessness of the idol."*

OF QUINTIA AND LESBIA.

Quintia is beauteous in the million's eyes:
Yes, beauteous in particulars, I own;
Fair-skinn'd, straight-shaped, tall-sized; yet I deny
A beauteous whole:—of *charmingness* there's none.
In all that height of figure there is not
A seasoning spice of that—I know not what;
That piquant *something*, grace without a name;
But Lesbia's air is charming as her frame.
Yes! Lesbia, beauteous in one graceful whole,
From all her sex their single graces stole.

—*Elton.*

In the next epigram, the poet acknowledges, in handsome terms, a benefit he has received at the hands of Cicero.

TO MARK TULLY.

The senate's and the forum's grace,
Tully! whose like of Roman race
Nor is, nor has been, nor will be—
Catullus pays his thanks to thee;
Thanks paid to him of patrons first,
But paid, alas! by him of poets worst.

The next poem is a unique. It is addressed to Sirmio—a spot endeared to Catullus probably by the circumstance of birth; at all events, by the associations of boyhood, and by the pride of property in the soil. He was bound to the locality by a twofold tie: Sirmio was his, and yet he was Sirmio's. The claim of the master, in these exquisite verses, is therefore so softened down as to leave scope and sway to the filial feeling for the natal soil.

A brief description of the spot may not be unacceptable to the reader. Sirmione, then, for such is the modern name, is a small promontory projecting into the Lago di Garda. "It appears," observes Eustace, in his Classical Tour, "as an island; so low and so narrow is the bank that unites it to the mainland. . . . . The soil is fertile, and its surface varied, sometimes shelving in a gentle declivity, at other times breaking in craggy magnificence, and thus furnishing every requisite for delightful walks and luxurious baths; while the views vary at every step, presenting rich coasts or barren mountains; sometimes confined to the cultivated scenes of the neighbouring shore, and at other times bewildered and lost in the windings of the lake or in the recesses of the Alps." We need not wonder that Catullus was enamoured of such a delicious retreat, especially after a long absence.

TO SIRMIO.

Sirmio! what spot may rank thyself beside?
Of green peninsulas the pick and pride;
Bright eye of isles! where'er their verdure rest,
On placid lake, or ocean's briny breast.
Home of my heart! with what delight I flee
From foreign shores to happiness and thee!

* Moore's Byron, vol. ii.

No more a wanderer on Bithynia's plain,
Yes, yes—I am, I *am* at home again.
Rid of a load of cares, at last to come,
Wearied with travel, to one's own dear home—
The old familiar couch again to press,
And feel it yield—oh! this is blessedness!
Enough of luxury that single day
Doth bring, a lifetime's labours to repay.
Fair Sirmio! smile: joy is thy master's due,
Return'd from far: laugh forth, ye waters blue!
And all familiar things your olden look renew!

The ruins of the poet's mansion are still to be seen. From their appearance, it has been concluded that the buildings, when entire, were about seven hundred feet in length, and fully three hundred in breadth. These dimensions may convey some notion of the magnificence of Roman villas. It is to be observed, however, that each villa consisted of three distinct buildings; the first of which was occupied by the family, the second was allotted to domestics, and the third was reserved as a repository for wine, fruit, and all sorts of stores.

As a specimen of our poet's pathetic manner, we subjoin the elegy on his brother. This poem must have been written about the same time as the address to Sirmio.

DIRGE AT HIS BROTHER'S TOMB.

Slow faring on o'er many a land and sea,
Brother, I come to thy sad obsequy:
The last fond tribute to the dead impart,
And call thee, speechless ashes as thou art.
Alas, in vain! since fate has ravish'd thee,
Even thee thyself, poor brother! torn from me
By too severe a blow—let this be paid,
This rite of ancestry, to soothe thy shade.
Let this, all bathed in tears, my friendship tell;
And oh! for ever, bless thee, and farewell!

—*Elton.*

There is much quiet beauty in the next specimen. Catullus condoles with a brother bard on the death of his mistress.

TO CALVUS ON THE DEATH OF HIS QUINTILIA.

If e'er in human grief there breathe a spell,
To charm the silent tomb and soothe the dead,
When soft regrets on past affections dwell,
And o'er fond friendships lost our tears are shed,
Sure a less pang must touch Quintilia's shade,
While hovering o'er her sad untimely bier,
Than keen-felt joy that spirit pure pervade,
To witness that her Calvus held her dear!

—*Elton.*

With the following extract from one of the epithalamia we close our selections. The marriage chant is kept up, alternately, by young men and maidens. The parts are, of course, composed in character—the lads extolling, the girls denouncing, matrimony. The two images suggested by these opposite expositions of sentiment have few rivals and no superiors in the whole compass of poetry, whether we consider the felicity of the conception, the elaborate delicacy of the execution, or the effectiveness of the disposal. We are agreeably surprised to meet in the retort so complete a counterpart to its playful provocative; and are delighted to find that fancy, whom we thought an antagonist, has suddenly shifted sides, and become transformed into an ally.

VIRGINS.

As in fenced gardens blows some flow'ret rare,
Safe from the nibbling flock or grinding share,
Which gales refresh, sun strengthens, rain-drops rear,
To many a youth and many a maiden dear;
Clipt by the nail, it bends the stem and fades,
No more by youths admired, or wished by maids.
So loved, the unpolluted virgin blooms;
But when the blighting touch the flower consumes,
No more she charms the youth or charms the maid:
Come, Hymen! Hymen! give the nuptials aid.

YOUTHS.

As on the naked field the lonely vine
Yields no sweet grape, nor lifts its tendril twine,
Droops with its weight, and winds its tender shoots,
With earthward bent, around their twisted roots,
Nor herd, nor peasant, in the noon-day heats,
Beneath its chequer'd bowery shade retreats;
But if it clasp some elm with married leaves,
Its shade the peasant and the herd receives:
Such is the virgin who untouch'd remains,
While still unwoo'd her useless beauty wanes;
But, wedded in her bloom, those charms delight
Her husband's eyes, nor shame her parents' sight.

—*Elton.*

On the poetical character of Catullus we shall not enlarge. It is evident that he has proved himself capable of greater things than he has achieved. In the ready seizure of happy turns of expression, in the adroit shaping of speech to every flitting shade of sentiment, in giving each "airy nothing" of the fancy its aptest mould and embodiment in words, he is unsurpassed, perhaps unrivalled. One or two of his longer poems (if he is not indebted for these qualities to his Greek models) evince, however, a range of tragic power, a mastery over the higher passions, a sympathy with the saddest or stormiest workings of the human spirit, which may well awaken our regret at his spending his strength on trifles. Still more is it to be deplored that so fine a genius should have lent its aid to licentiousness. It is instructive, however, to observe that it has suffered in the attempt. The works of Catullus suggest a truth which all reading and reflection will confirm: the truth, that *it is of the essence of poetry to be pure.* To this rule there are no real exceptions. Poetry, like music, has no congeniality and can brook no alliance with the grosser sentiments. No man can be a poet without having virtue or feigning it. The muse will not stoop to be the minister of vice The finer sense to which poetry addresses itself will discriminate between its genuine pabulum and the pernicious substitute; and taste will thus lift no less loud and distinct testimony than conscience to the pure and lofty attributes of the Father and Framer of the human mind.

PEDESTRIAN EXCURSION IN SWITZERLAND.

LUCERNE,

BY ALPNACH AND LUNGERN, TO BRIENTZ.

AUGUST 19.—When we looked out from the inn at Lucerne, we found that the slight remains of mist had disappeared; the lake reflected the spotless blue above it, and Pilatus shot his shattered peaks into a cloudless heaven. A balcony from the window of our inn (the *Wage*, or Balance) overhangs the lake, and there we stood for some time dropping crumbs of bread, and watching the mobs of little fish that rushed upon them, darkening and disturbing the blue water with their numbers and turbulent activity. The sight of so many fish brought our associations to the ultimate uses of fishes, and forthwith, in a fit of enthusiasm, we directed a supply of the agile animals to be presented on our breakfast table. The result was not satisfactory. The fish were better at eating than at being eaten, and however well they became "the sacred lake far off among the hills" would have been a bad concern at Billingsgate.

Having purchased some geographical information from a professional guide, who intimated a strong and no doubt disinterested wish to make one of our body, we started from Lucerne,* keeping the border of the lake southward. We had but just cleared the suburbs, when we were overtaken by two young Englishmen, whom we had met on the Righi. As we found we were all going much in the same direction, and travelling on a like system, our parties became amalgamated for the time being. Of these two young men, the one bore the name of a celebrated statesman, the other that of a distinguished physician and naturalist, of whom I afterwards found he was an immediate descendant. They both had the unobtrusive and accommodating manners of the well-bred English gentleman, whose position is too well acknowledged to require being perseveringly or boisterously asserted—a class, of which it is to be regretted that on the ordinary continental routes our neighbours see too small a proportion. On reaching Winkel, we took boat for Alpnach. The lake here runs into long narrow bays between the spurs of Pilatus; and the largest of these, called the Lake of Alpnach, penetrates almost within the bosom of the mountain. The banks of this solemn and retired inlet run up several thousand feet, and are, I should suppose, about as near the perpendicular as will admit of the growth of wood. Steep as they seem—so much so in appearance as hardly to appear accessible to an active climber—there is scarcely a spot bare of pine trees, which, rising in endless tiers above each other, look like a dense leafy army not at rest, but struggling to mount the steep bank. It was here that the trees were brought down by the well-known slide of Alpnach, so graphically described by Professor Playfair; but the operation has been for many years abandoned, and is now a matter of history. There are other and more poetical subjects of association in the depths of this solemn valley, for a small ruin near the lake marks the Castle of Rotzberg, the first feudal fortalice seized by the confederacy of the fourteenth century. The village of Alpnach is remarkable for the comfort, neatness, and handsomeness of its houses, and for a new church of great size and of light and graceful architecture. The road to the village and Lake of Sarnen is flat, and we passed it under a burning sun. Though scarcely among the wildest scenery in Switzerland, we were now on the spot round which centre many of its deepest historical feelings, whether as they have sprung from the tragic cruelty that was endured or the signal vengeance that was accomplished. At the mouth of the valley of the Melcthal, eastward of the village, lived Arnold-an-der Halden, who struck the first blow for freedom, on the Austrian bailiff that attempted to seize the cattle from his plough; and nearer still is Landenberg, the castle of the bailiff, which was seized by the confederates after its lord had taken vengeance for the resistance of Arnold, by putting out his old father's eyes.

We boated along the Lake of Sarnen, and at its farther end found ourselves in a wilder class of scenery, and with a steep ascent, called the Kaiserstuhl, to climb. The road was rough and winding, and most irregular in its gradients; for sometimes, after a rapid ascent, there was a partial depression, and then an ascent again. This arose, apparently, from its passing chiefly among debris lying between the mountains. Gigantic blocks of stone were scattered here and there, so large that it was necessary to treat them as hills, and wind round them or go over them. The effect, however, was not that of desolation, for the verdure was everywhere full and thronging, and not only lichens and brushwood, but large trees hung their heads over the stony masses, or clothed the crevices in the mountain from which they had been hurled. To the true Catholic, there were ample means of deriving spiritual consolation from the fatigues of the road, for every here and there rose *crosses*, or small chapels, with German inscriptions applicable to the spot. Bathed in perspiration, we took a good rest beneath the trees at the apex of the pass, by the brink of a cool and most grateful fountain. We descended towards one of the most interesting illustrations of the industry and enterprise of the modern Swiss—the Lake of Lungern, which had been literally tapped by the proprietors round its border, for the sake of the alluvial soil that would be laid bare by drawing off a portion of the water. A slanting tunnel, through the Kaiserstuhl, for the purpose of accomplishing this object, was commenced in 1788. With many interruptions, it had proceeded so far before the year 1835, that it only required to be carried a few feet farther; but these few feet were to open the bore upon the lake in the midst of its waters, and the perforation was the most difficult part of the whole project. After other methods had been successively considered, and decided on as insufficient, it was resolved to blast the rock. The labour of getting the powder along the narrow gallery, and lodging it dry in the upper extremity, drenched by water oozing from the lake, was prodigious. An anxious moment it was for those who had expended so much of their labour and their narrow capital in the project, when all was ready, and the train was fired by two bold men, who had to retreat through 1300 feet of tunnel after applying the match—a few moments were to realise all their hopes, or to prove them vain. The time calculated for the explosion had elapsed by ten minutes, and hope was almost abandoned, when two dull successive reports were heard beneath the rock, but the Kaiserstuhl did not tremble, and the lake remained as smooth as ever; and so slight did the manifestation appear, that the anxious peasants could not associate with it the important results they had awaited. At length, however, a shout from below announced the joyous result, and the waters and mud of the lake were seen issuing forth in a turbid stream. The aperture was small, and sixteen days elapsed before the lake sunk to its level. Though the descent of the waters was thus gradual, there was considerable ground for alarm as to the safety of the banks, which cracked and slipped as the removal of the partial aid afforded by the water tended to disturb the balance of support by which they were preserved at their angle; but there was no material calamity. We saw evidences of the shock which the solid earth had sustained. Here and there rocks were split, and there were slips of fresh earth, while large trees impended menacingly, parts of their roots being laid bare by slips, and the remainder clinging convulsively to the firmer rocks above. We looked with anxiety for the advantages which had been gained by this gallant undertaking, and at first with some disappointment; for towards the lower end of the lake, where the banks, both above and below the original water-mark, were pretty steep, there was but a narrow slip of soil, which seemed stony and hard, and bore but a scanty and disconsolate-looking crop of meadow grass. Towards the upper end, however, where the stream that fed the lake would deposit the alluvium gathered in its course, there was a considerable expanse of field, amounting, apparently, to some hundreds of acres; and though it had but a raw and uncomfortable appearance, industry seemed to be actively metamorphosing its surface, for there were some fields of rich grass, with fences round them, and one or two cottages seemed to be in course of erection. The cost of the undertaking was £5000, besides 19,000 days' labour bestowed by the peasantry of the district, which, if we estimate each day only at a shilling,* would add nearly another £1000. Such a sum would seem an over-estimate of the value of the property cleared, yet those who know best must hold the adventure to have been a successful one, as their neighbours are projecting a "tap" of the Lake of Sarnen. The banks of Lungern are doubtless much shorn of their original beauty, but the spot is interesting to geologists as a fresh and vivid illustration of the aqueous deposit of strata. Along the upper margin, where the water originally touched the land, there is very plainly visible the modulated slope, which has been the ground for attributing the parallel roads of Glenroy to the agency of water.

In Lungern we found a considerable inn. We had well earned our dinner by our day's exertion, and we fell to it with no less satisfaction than our landlord evidently felt in supplying five unexpected guests from the land of merchant princes. It came to pass that while we were busy eating, we heard a considerable hubbub in the lower storey of the inn, the predominating feature in which was pretty evidently a voice from our

* It will be observed that in these sketches, any account of Lucerne, and of the other places lately described in a series of articles in this Journal, is purposely omitted.

* Mr Symons, in the assistant Hand-Loom Commissioners Report on Switzerland, calculates the wages of country road-makers in the neighbouring canton of Zurich at from 8 to 10 batzen, equal to from 1s. to 1s. 2½d.

native land. The sound gradually mounted the steps; our door was thrown open, and a tall, thin man, with a very red face, and with other symptoms of strong agitation in his deportment, stood before us, and said in a loud voice, "Is there any body here who speaks English?" Now, here were five of us sitting together, not one of whom had the slightest doubt of his being gifted to full perfection with the desired accomplishment—indeed, we had found it for some time to be precisely that lingual endowment of which we possessed the largest quantity, but for which we had found the smallest use; and this sudden demand came upon us much as an application to a tradesman might do for some commodity of which he possessed an indubitably large stock, which no one had previously shown any disposition to aid in diminishing. But the comparison must stop short. Our method of receiving the appeal was far from business-like, for we burst into a simultaneous fit of laughter. When we had recovered our self-possession, the visitant stated his case. He had just parted with a friend who, in that neighbourhood, had lost or been deprived of a cigar case, and he was convinced he had found the individual who had come into the possession of the article, but who was evidently shielded by a wicked combination of the neighbours. He hoped we would give our assistance to the cause of right and justice, and stand up for the protection of our countryman from pillage. Thereupon he departed, and returned pushing in by the shoulder a good-natured-looking young peasant, who seemed a little astonished at the ordeal he was going through. He held in his hand one of the common china-pipes smoked by the peasantry of half the European continent. It was this curious article which it appears the judicious distinguisher of right and wrong supposed to be the missing cigar-case; and his request to us was, that any of us who could, should question the young man as to whether the article was his own and honestly come by. One of our number, who, by reason of his superior knowledge of French, had generally acted as spokesman when that language was in requisition, with the natural politeness which sometimes makes one assent to a request without considering it, asked the peasant if the pipe was his own. The words were no sooner said than repented of; and the youth being a German, probably did not understand what was said. A pretty business, indeed, it would be if an English clodhopper were laid hold of by one Frenchman, and dragged into an inn to be exposed to a judicial investigation by five others! But the inhabitants of the touring districts frequented by the English have a good-natured if not a flattering theory for such exhibitions of insolence. They believe it to be the outbreaks of a certain aberration of intellect to which the inhabitants of our foggy island are peculiarly liable, and our examinee would probably walk homewards in the cool of the afternoon quietly smoking his pipe, and cogitating over the circumstance that he had encountered six inhabitants of the United Kingdom more mad than usual. Our thief-catcher walked off soon after his victim had got his acquittal, and we heard him again mounting the stairs in company with some one. This time, however, it was a well-dressed, middle-aged woman, English, and, as we naturally concluded, his wife: the more especially as she had a slight touch of shrewishness in her appearance and manner, which seemed like the reflected light of the broader characteristics of the other. They put many questions to us about the proper fares for the hire of chars and conveyances of all sorts, but we knew none of these things, making use of a species of conveyance for which there could be no overcharge. I must admit that the gentleman began to show himself a little ashamed of his conduct, which he imputed partly to the state of bewilderment he was in from going through a country of which the inhabitants did not understand one word he said—a calamity which he seemed to consider entirely *their* fault, and none of his own. At length, the amiable couple departed—a fine specimen of that ignorance, bigotry, and insolence, that have brought disgrace on our country all through the world.

We were not done with strange guests. Before we had finished, there seated himself very quietly beside us an individual who was evidently little given to the practices of shaving and washing—not that he cultivated mustachios, or had any thing of the bravo about him—he was simply what might be called "seedy," and slightly raffish-looking. His clothes were not of any tourist cut, yet they would not have looked very well either in a drawing-room or in a promenade in "town." His shirt was not very white; and his travelling accoutrements, instead of being strapped up in a neat haversack, were rolled up globularly in a cotton handkerchief, none of the cleanest. Yet, with all this, the man acted as one who considered himself, and had no doubt of others looking upon him, as a gentleman; and his manners did justice to his claims. His face was quick, and intelligent too, and his conversation that of an educated man. There was nothing very remarkable about all this, at least abroad; but somehow or another, this stranger, eating his dinner in a corner, and venturing a remark occasionally in a very quiet way, had produced some ominous effect on our party, which I could not at first account for. Somebody dodged me in the elbow when I spoke of its being time to go; and a most mysterious wink was conveyed to me when I spoke of the distance to our place of destination. At last, however, we set off, and the stranger with us—then came out the mystery. We were for Brientz; our two English friends had made up their minds to go to Meyringen. They informed me, however, that they would prefer altering their route and accompanying us, as they had strong suspicions that the unclean stranger might be connected with a band of robbers on the mountain track. Without criticising too minutely the cause of the arrangement, I felt gratified by the effect; for we found our new friends to be pleasant and joyous travelling companions. Meanwhile, it occurred to me that the stranger was contemplated in a rather uncharitable point of view, and I tried to make up for any distrust he might perceive on the part of others by walking with him, and carrying on a conversation so far as my command of French permitted; it was not that I professed any greater indifference to bullets and poignards than my companions, but I entertained a totally different view of our position. One of the first remarks my new companion made was rather amusing, in connexion with the dire suspicions raised about him. When we came to a particularly narrow part of the road, he pointed to the rocks above, and explained how, if we had been on the other side of the Alps, we might be attacked in such a spot by a band of armed bandits. It occurred to me that his description had a rather theoretical and merely amateur air about it; and I had even the conceit to suppose that if I were to betake myself to such expedients, I could take a more practical and serviceable view of their operation than my companion seemed to do. He appeared to be quite willing to give any required information about himself. He was a Russian, had studied in Germany, and taken a degree in medicine. He let me into a little secret about Swiss inn-charges, after asking, with a knowing smile, what we had paid for our dinner. The bill had amounted to four francs each. He asked if there was any thing inferior to ours in the meal he had got himself, except that it was served in bulk instead of in courses, and *he* had paid but a franc and a half; such were the effects of clean linen and our extensive acquaintance with the English language. The Russ, however, had another side of the picture to give. He had ventured, in the course of his wanderings, to pay a short visit to our great Babylon, though he could not speak a word of English; and he had so contrived matters that, one day tired with roaming about the endless streets, he bethought himself of being refreshed with a bowl of soup, for which he was charged three shillings. It was evident, however, that he did not understand the philosophy of his misfortune, and mistook the uniform high charge of a West-End hotel for an isolated attempt to fleece a foreigner.

The footpath led up to the pass of the Brunig, and was delightfully wild and solitary in the stillness of the evening. Occasionally it was hard climbing among the rocks, and at other times we crossed patches of soft green sward, while over our heads hung solemn pines as motionless as if they had been painted on the darkening sky. It was almost dark when we reached the top of the pass, where we had to part with the Russ. He seemed to think the design originally expressed by our English friends to proceed to Meyringen was some misunderstanding, for he left us all with a hearty farewell; and we heard him cheering to us as he disappeared in the gloom of the descent. It was now a matter of some anxiety for us to get forward, for the night was deepening apace, and of the celebrated expanse of valley scenery which stretches towards Meyringen we could only trace the faintest outline. We had not gone many paces when we found the path leading directly up to a house, and showing no means whatever of passing it by. This seemed to be a decided stoppage, and to indicate a mistake; but it is a foolish thing to come to rash judgments in a strange land, and it was as well to make inquiry of the inmates before we attempted anything on our own responsibility. The result proved the prudence of the measure; we were on the right path, and it passed *through the house*, which turned out to be a toll-house, marking the limits of the canton of Berne. The road kept to its high level, between three and four thousand feet above the sea, for some miles, and we went on in the dark with great animation, talking on all sorts of subjects. I know not how many dangerous spots we may have passed unregarded, when suddenly the thought occurred to us, that here we were on a Swiss pass—a sort of place proverbial for all kinds of hair-breadth 'scapes—marching along in the dark as carelessly as if we were on an English turnpike. Perhaps it was something in the nature of the spot we had just reached that suggested the necessity of caution. We were on a ledge of bare rock, sloping downwards to the left, in which direction we heard the rushing of waters, coming as it were from a torrent far beneath, and smothered among thick foliage. We grew very cautious on this discovery, and passed along in a string, feeling the way with our sticks before we stepped, and planting our feet firmly and steadily. This doubtful state of matters did not last long, however; we soon found that we were passing between two rows of trees, and rapidly descending. When we reached the inn at Brientz, we found it was full—not a hole in which we could be stowed. Contemplating our blank faces on this avowal, a good-natured guide presented himself, and offered to conduct us to the other inn, about a mile off. Here the first part of the answer was the same, but not the second. The case was seen to be one for sacrifices, and the civil people said they would try to put some sort of beds together for us in the servants' rooms. They were eminently successful in their endeavours—at least if the having no recollection of it but the intense soundness of the sleep it afforded be considered valid testimony to the goodness of a bed.

BITS FROM THE BRITISH ASSOCIATION.

[The meeting of the association at Manchester, June 23-30, was a very brilliant one as to attendance and local circumstances, and at the same time rather more than usually productive of important novelties in science. From the ample reports given in the *Manchester Guardian*, we glean a few things of the kind most likely to be generally intelligible and interesting.]

AN EXPERIMENT IN SPADE HUSBANDRY.

A PAPER by Mrs Davies, widow of the late President of the Royal Society, descriptive of an experiment which she had made in small lettings of land, was read in the Statistical Section. The writer began by stating that it was only lately that she had become aware of the great advantages that would result from a more careful cultivation of the soil; but, from what had taken place under her own observation within the last few years, she felt persuaded that, by due management, the most fruitful causes of poverty and distress in this country might soon be removed. It had been stated in the House of Commons by Mr Pusey, that the average produce of land in Great Britain was 26 bushels of wheat an acre. Now, if it were possible, merely by an improved mode of cultivation, without any additional expense, to increase the produce to 27 bushels an acre, this would give an increase of 475,000 quarters, which, at the average price of grain, would be worth L.1,200,000 per annum, equal to a capital of L.36,000,000 gained for ever. But, in her own experience, she had found far greater results than this. By careful weeding, manuring, and cultivation of the land, which was in many instances done at very little expense, she found that some of her tenants raised 40 bushels of wheat an acre; that they were paying double the rent which she received for the same land when it was in large farms; and that, out of 124 tenants among whom the land was now divided, not one had fallen a single farthing in arrears since 1830. With regard to the industrial school which had been lately formed under her patronage, the results had been very gratifying. It appeared that the schoolmaster paid L.11 per annum for his dwelling-house and school, in addition to which he held three acres of land at L.3 per acre. His school consisted of twenty boys, of the average age of eight years, who worked for him at out-door labour three hours a-day, in return for three hours' instruction in reading, writing, and accounts. The boys thus educated were much better able, when they left school, to undertake farm labour, from the practice they had had; and the schoolmaster considered that their labour amply rewarded him for the instruction he gave them. From the manner in which his land was cultivated, he had been enabled to keep two cows, where he would otherwise not have been enabled to keep more than one; indeed, as was stated by the writer of the paper, but for the school and the labour he derived from the scholars, he would have been forced to go into the workhouse with his family, consisting of five persons, which would have cost the township about L.39 a-year. The writer concluded by remarking, that the statements she had made regarding an increase of rent from the small allotment system would no doubt surprise those who imagined that large farms must necessarily be the most productive; but experience was better than theory. As she had already stated, out of 124 tenants, not one had gone a farthing behind since 1830; and yet they paid a much higher rent than she had received previously to that period.

This paper led to a conversation in which many eminent members of the section expressed the highest gratification with the experiment described by it. "Think," said Colonel Sykes, "of the schoolmaster, who might otherwise have been an inmate of the workhouse, not only teaching twenty boys the rudiments of an ordinary education—reading, writing, and accounts—without receiving any wages, but also of his actually paying L.3 per acre for his land." Mr Felkin said that, when travelling on the continent, he had found that even in those parts where the competition for employment was very intense, the subdivision of land into small allotments prevented the labouring class from ever becoming so destitute as many are in this country in periods of commercial depression. By a judicious system of husbandry, and by the careful application of manure, they were enabled to obtain a much larger amount of produce than the same extent of surface would yield under the large farm system. Looking at the present state of the country, and the number of industrious individuals without employment, he thought it was time to ask whether this mode of cultivation ought not to be tried as far as possible? In Saxony a large proportion of the artisans had small plots of land, which they cultivated at intervals; and thus were enabled to procure many comforts which would not otherwise have been within their reach. In that country there were twenty-five thousand families employed in the manufacture of hosiery, most of whom had small plots of land, which enabled them to work for lower wages than were paid to English operatives who were engaged in the same branch of manufactures; in consequence of which, our workmen were superseded in the foreign market. Mr George Webb Hall thought the association was much indebted to Mrs Davies for her valu-

able communication. The success of her industrial school was no less gratifying than wonderful; but the secret of its success was easily explained. By the terms on which the schoolmaster and his pupils were engaged to each other, the most powerful feelings of the human breast were called into play. It was the interest of the master to teach his scholars how to work for him most effectually; while, on the other hand, his scholars, in acquiring that lesson, were no doubt enjoying themselves far more than if they had been all the while pent up in school; and as for the lessons they received during the rest of the day in reading, writing, and accounts, he was convinced that they would make much more rapid progress in three hours, thus alternating with out-door exercise, than they could possibly do in double the time were they to continue at their tasks without intermission. As regarded the great increase of produce on small farms, and also the increase of rent which the tenants were enabled to pay, he would warn them not to jump too fast to general conclusions; nor to suppose, that because this experiment had succeeded so well, every thing else must be wrong. For his own part, his wish was that every working man could have his rood of land as a large garden plot, on which he might raise a good portion of what was required for the subsistence of himself and family; but not that he should be dependent for support on the sale of farm produce. It was well he thought that this distinction should be kept in mind when talking of the small allotment system. The great object with most farmers was to obtain the largest amount of produce out of the land with the least possible expenditure of labour; but the successful development of that principle was not opposed, in his opinion, to the small allotment system. From his own experience, too, he might say that he had never known a case in which any of those cottagers with a small plot of land had applied for parochial relief.

TALES OF THE JURY ROOM.*

Among the Irish novelists of the last few years, Mr Gerald Griffin, the author of the "Collegians" and some other productions, had earned for himself a high place before his premature and lamented death occurred. A play, entitled "Gisippus," has been represented with success since that event, and a collection of tales has also been published posthumously. These stories, it strikes us, are juvenile compositions, yet several of them are in no slight degree entertaining. Mr Griffin styles the collection "Talis Qualis [a sort of pun, perhaps, but literally signifying Such as They Are], or Tales of the Jury Room;" and they are imagined to be told, for mutual recreation, by an Irish jury shut up for an entire night, in order to attain unanimity in their verdict. One of them, entitled *Mr Tibbot O'Leary the Curious*, opens with the description of an antique house in Ireland, on the Upper Lake of Killarney, where lived Mr Tibbot O'Leary, a small squire of lonely habits, who, after receiving a fair education, devoted himself to antiquarian speculations, the Round Towers of his native country being his favourite theme. He was of a simple, eccentric, and curious disposition; and kept only one servant, by name Tom Nash, who was almost as odd as his master, only a little more 'cute. Late on an autumn evening, Mr Tibbot O'Leary was poring over his strange antiquarian stores, when "the unusual sound of a horse's hoof was heard upon the avenue. Mr O'Leary, in his room, holding the candle in his hand, and Tom Nash in the kitchen, at the same instant paused to listen. What belated wight could it be, who sought so unfrequented a place of shelter as Chore Abbey, at this lonesome hour? It was evident the rider was a man, and a merry fellow too; for as he drew near the house, they could hear him singing, at the top of his voice, a burlesque Latin version of a popular song. Both the voice and words seemed familiar to the ear of Tibbot O'Leary, for his countenance immediately exhibited a mingled expression of pleasure and alarm.

'Bless me!' exclaimed the squire, 'it is he, sure enough! Was ever any thing more unfortunate? How did he find me out here, and what shall I do with him?'

Unconscious of the observations which his arrival occasioned within door, the horseman, instead of taking the trouble to alight at the hall door, continued to shout and sing alternately, at the top of his voice: 'What, ho! house! Why, house! I say, is there any one within?'

In the mean time Tom Nash had made his way to the presence of his master. 'The key of the hall doore, sir, if you plaze.' 'Oh, Tom, I'm ruined!' 'How, sir?' 'This is Mr Geoffry Gunn, an old college chum of mine, and the last person in the world whom I would have find me in this place.' 'Well, sure 'tis aisy for me to give him the cold shoulder, or for us all to hould our tongue, an' purtind we don't hear him, an' lave him bawlin' and singin' abroad there 'till he's tired. The Gunns arn't only a modhern stock in these parts. The first of 'em come over ondher Queen Lizabit.' 'Nay, nay, that would never answer; I am very glad to meet him, though I could wish —— there he calls again; run, run and open the door! And stay; have you got anything for supper?' 'Lashins and lavins.' 'Very well, have it ready, and bring it when I call.' If it be true, as some wise men have asserted, that the more a man does the more he is able to do, it is no less a fact, that the less a man does the less he is inclined to do. The comparatively idle life which Tom Nash led under his studious master had strengthened to the utmost a powerful natural taste for doing nothing, and rendered him proportionably unfriendly to any demands upon his labour, especially when they happened to be unforeseen or out of course.

'Why, then, you're welcome, as the farmer said to the tithe procthor,' he muttered, going down stairs; 'what a charmin' voice you have this evenin'. I must go, make up your horse now, and get him a feed, and be cleanin' your boots an' stirrups, in place o' bein' where I ought to be at this time o' night—in my warm bed. An' all on account of a roystherin' bawlin' bedlamite that —— What's wantin', plaze your honour?' he added in an altered tone, as he opened the door and confronted the belated horseman. 'Is your master at home?' 'He is, plaze your honour.' 'Will you tell him that his old friend Mr Gunn is come to see him?' 'He knows it already, plaze your honour. He heard your honour singin' on the aveny, an' he knows the voice. Tom Nash, says he (mainin' himself), that's Misther Geoffry Gunn, my old friend, an' I'm very glad to meet him, says he; take care an' have supper ready when I call!'"

The interview between the old friends was as cordial as might have been expected. Mr Gunn made himself most agreeable to Tibbot O'Leary, having, indeed, a plan of his own in view. It was no less than to get Tibbot married, in order, by so doing, either to fulfil a whim, or to oblige a friend of the lady. "'Apropos of antiquities, Tibbot,' says Mr Gunn, 'are you acquainted with this great female antiquary who lives in your neighbourhood?' 'Not I. Whom do you mean?' 'Why, now, that's very odd. I have only come down to this part of the country to snatch a peep at the lake, during the vacation, and I know more of your neighbours than you who live on the spot; but then, rogue as you are, I would be a fool to you, I warrant, if we came to question about the court of the Ptolomies or Rameses. But, indeed, it was accidentally I heard of her first. She is a Miss Moriarty (a genuine west country stock), and a very witch at the books—knows Hebrew, and can even scrawl a hieroglyphic or two of the Chaldaic and such things. As for Greek and Latin, she makes no more of them than a squirrel would of cracking a nut.'

'Is it possible? How odd that I should never have heard of her?' 'Not at all odd, my dear fellow, you were busy about more important things. It is only for us ephemeral beings to have our ears cocked for such every-day novelties. But, indeed, you ought to know her. She lives not more than half a mile from here, on the Kenmare road, in a farm-house tenanted by Mr O'Connor, the husband of a relative, where she has a couple of rooms filled with all the antediluvian rareties in the world. You should have heard her upon the Round Towers.' 'You don't tell me so?' 'She has a theory of her own about them. I had the full benefit of it, for a few days since I was compelled to take shelter in the house from a shower of rain, and had the honour and happiness of hearing, during the half hour I remained, more words I couldn't understand than I did the whole time I was in college.'"

Geoffry Gunn departed from Mr O'Leary's in due course, but his words did not pass from Tibbot's memory. On the contrary, the lady "who had a theory about the Round Towers" haunted his thoughts perpetually, and he began to astonish Tom Nash by exhibiting the most unintelligible spite at the continuance of good weather which the country then enjoyed. "At length, about the end of the month, the mercury began to fall, and his master's spirits to rise in an inverse ratio, which was exceedingly puzzling to Nash.

'Tom,' said his master, with a look of sprightliness and glee, such as he had not manifested before since the visit of Mr Gunn—'Tom, I'm in hopes we'll have rain to-morrow.' 'In hopes, masther? I'm sure 'twould be our ruination. Sure, 'tis to-morrow we have the praties dug in the next field.' 'Hang the potatoes!' exclaimed Mr O'Leary. 'Hang the praties! Mille murdher! I never heard so foolish a speech as that from him before. Hang the praties! The whole stock we have agin' the winter! I hope them ould books an' round towers ar'nt makin' a whirligig of his brains,' muttered Nash, as he left the room. 'Wisha, we never heard more than that any way. Hang the praties!'

Early on the following morning Nash went into his master's room as usual to take his clothes to brush. While he emptied the pockets, and laid the contents on the table, Mr O'Leary, awoke by the jingling of keys and halfpence, turned his head, and asked—'Well, Nash, are we likely to have rain?' 'I never seen such a mornin', sir. The sky is all one cloud from aist to west, an' so low that I could a'most tetch it with my hand. I don't know from Adam what we'll do about the praties; the men wont be able to give half a day with the weather—a clane loss of half a guinea at the laist.' 'That's delightful.' 'Delightful!' repeated Nash involuntarily, looking over his shoulder with surprise. 'He's pursewarin' in it, I see.' 'Nash,' said Mr O'Leary, pulling back his nightcap and sitting up, 'have both horses saddled and fed. I intend riding out immediately after breakfast.' 'Is it in the rain, master?' 'It is. Make haste, and do as I desire you.' 'Pursewarin' all through!' ejaculated Nash, as he went out and shut the door behind him.

Some drops were just beginning to fall as Mr O'Leary and his faithful squire set off upon their journey. They rode on for something more than half a mile, at the termination of which space the rain began to fall in torrents. Mr O'Leary now quickened his pace, and Nash followed his example, but their speed did not save them from a thorough drenching. After riding about a quarter of a mile farther, Mr O'Leary suddenly pulled up his horse, and said, 'Tom, isn't that the avenue leading to Mr O'Connor's?' ''Tis, sir.' 'I think we might as well turn in and ask for shelter there until this shower passes, at all events.' 'The Lord be praised, he's comin' to again,' Nash added to himself, as he alighted and opened the gate."

Mr Geoffry Gunn had prepared his friend Mr O'Connor, with whom the learned Miss Moriarty resided, for Tibbot O'Leary's visit, as well as its motives and probable consequences. Mr Gunn had also given a delicate hint of O'Leary's antiquarian tendencies to the lady herself, and had also insinuated a word, as if casually, about Tibbot's antipathy to "false teeth and wigs." When the latter gentleman arrived, as related, he found Miss Moriarty to be chiefly remarkable for a very fine head of hair. Being well pleased with the prospect of a match for his relative, Mr O'Connor soon found an excuse for leaving the pair together. Tibbot was a little confused at this proceeding, and the first words which he bolted out were, "'P—p—pray, ma—ma'am, what is your opi—pi—pinion of the r—r—round towers?' 'I can hardly say,' replied Miss Moriarty, with a degree of ease which somewhat diminished the confusion of her visiter, 'that I am satisfied with any of the theories which have been broached upon that most interesting subject. You are aware that mankind have in all ages been remarkable for a love of the arduous, and that no pursuits have been carried on with greater zeal, expense, and perseverance, than those which held least hope of ever yielding any profitable result; and the most important practical discoveries in science have often been attained in the pursuit of some visionary and unattainable end. The search after the philosopher's stone led to the discovery of Glauber's salts—the study of judicial astrology produced those elaborate calculations in old times which are of such importance to the astronomer—and the desire to effect a north-west passage conducted the voyagers of England to the magnetic pole. Now, my theory is, that some philanthropic patron of letters in old time, observing this disposition in his species, had those round towers built with no other view than that they should exercise the research and ingenuity of the learned in succeeding ages, and, by furnishing an inscrutible subject of inquiry, perpetuate the study of Irish antiquities through all succeeding time.' The astonishment and admiration of Mr O'Leary had been reaching a climax during the delivery of this ingenious speech, at the conclusion of which he again sprang from his seat, and seemed about to fling himself on his knees in an ecstacy of delight; but recollecting himself in time, he drew back with a respectful bow, and remained in his chair."

Such an original theory on round towers was not to be resisted, and so, some time after the visit, "'Tom,' said Mr O'Leary, 'you must not put oats or potatoes into that parlour any more.' 'Why so, masther? what hurt is it doin' there?' 'No matter. She mightn't like it.' 'Is it ould Nelly, sir?' 'No; your mistress.' '*My* missis!' exclaimed Nash, dropping the bag of oats. 'Yes—didn't I tell you I am going to be married?' For nearly a quarter of an hour the master and man remained gazing on each other's countenances without uttering a syllable. At length the latter found words to say, in a tone of the profoundest sympathy, 'The Lord preserve us, masther!' 'Amen, Tom!' sighed Mr O'Leary; and not another sentence was exchanged between them upon the subject, until Mrs O'Leary, formerly Miss Moriarty, was introduced amid rejoicings that resounded far and near, to the venerable mansion which, it was the owner's will and pleasure, should thenceforth call her mistress.

For a considerable time after his marriage, Nash observed nothing in the demeanour or conversation of his master which could lead him to suspect that he regretted the step which he had taken. Mrs O'Leary was all that could be wished in every respect, either by master or servant, and indeed it surprised Nash a great deal more than he cared to let Mr O'Leary understand, how she came to be so easily satisfied. Matters continued in this even course, until they received a second visit from Mr Geoffry Gunn, now 'Counsellor' Gunn, who, on hearing the humorous antiquary repeat his happiness for the hundredth time, exclaimed, 'I can tell you, then, that if ladies are curious, they sometimes know how to keep a secret. Did you hear about Captain —— and his wife?' 'No—what of them?' 'A most extraordinary story they tell, indeed. They had been living together in perfect harmony, it seems, for more than twenty years, when she died, and it was for the first time discovered that she had two faces, one behind and one before.' 'Nonsense!' exclaimed Mr O'Leary. 'It may be so,' replied his friend; 'I do not answer for the reality of the story.'

'If it be true,' said Tibbot, 'I think the worst part of the affair was the keeping it concealed from her

* Three Volumes. London: Maxwell and Co. 1842.

husband.' As he said this, he could not help observing that his wife looked uneasy and confused, and a strange doubt rushed into his mind, which reawakened his original foible in more than all its former force. The conversation ended; but for a long time after, Tibbot did not retain the untroubled peace of mind which had till now accompanied his steps. The extreme amiability of his helpmate had won all his confidence, but it made him uneasy to perceive that Mrs O'Leary did not behave towards him with an equal absence of reserve. There was evidently something preying on her mind; and the more pains he took to remove every thing that could in the least degree interfere with her peace and comfort, the more she seemed to feel it."

At last Tibbot got a little calmed, and, after years of tolerable happiness, Mrs O'Leary died. Her death-scene was signalised by a strange and solemn request made by her to her husband. This was, that he would never "uncover her head nor touch her head-dress after her decease;" and she solemnly warned him that he himself would be the sufferer if he neglected the admonition. The first hours of sorrow over, Tibbot O'Leary felt his old curiosity increase tenfold, in spite of all his real respect for the memory of his wife. "By continually recurring, and meeting at each fresh assault a fainter resistance, it obtained at length a complete mastery over his mind. It was in vain he thought of Blue Beard, and a thousand other awful warnings of the kind. In the throes of his curiosity, desiring rather to gain an accomplice than a counsellor, he confided his agonies to Nash, and desired his opinion. Tom at once recommended a peep, though never so slight. 'But then her last words, Tom—her dying wishes.' 'Ay, sure she never'll know it.'

'Well,' said Mr O'Leary, much shocked, 'I am sure you do not consider the meaning of what you say. I wish, indeed, she had never given such an injunction, for it is probable I never should have thought for a moment about her head-dress. Could I trust you, Tom, with what I suspect to be the true cause of her injunction?' 'Could *you* thrust *me*, masther!' 'I believe I can. Well, then, Tom, I think the true reason is'—— he looked around, and then whispered in horrified accents in his ear, 'that my wife had two faces.'"

Tom Nash's curiosity now grew so overpowering that he easily surmounted his master's lingering reluctance, and, with horror-marked countenances, the pair crept into the room of Mrs O'Leary, when lo!——

The reader may be disappointed, if he pleases, but truth bids us say, that all that Tibbot O'Leary discovered on his wife's head, was—a *wig*.

JOTTINGS ON ORNAMENTAL GROUNDS.

Sir Thomas Dick Lauder's edition of "Price on the Picturesque," * notwithstanding its bringing the half-obsolete association theory of beauty into an unfortunate prominence, is an acceptable present to the world of taste. It is elegantly got up, yet in an economical style, and may be considered as calculated for a more extensive circulation than the original work has ever enjoyed. Sir Uvedale Price was a country gentleman of the best species of the old school—a man naturally of sharp wit and good judgment, whose mind had been improved by travel and scholarly reading. He lived (fifty years ago) just about the time when the system of Kent and Brown, by which so many fine old places had been outraged and ruined, was beginning to be suspected of not being quite the thing, and there can be little doubt that his work has contributed greatly to the introduction of better views. The two men alluded to were rather remarkable persons. Kent had been a coach-painter, and Brown a gardener; by native qualities, they rose to be regarded as authorities with regard to the disposal of ornamental grounds, in which capacity they were allowed to demolish the old and to dictate the new without the least control, for a long course of years. They also gave rise to what might be called a school, the pupils of which carried out their views, wherever they went, with the greatest perseverance. Many droll anecdotes are told with regard to the second of the two men, whose constant phrase on seeing a place, that it had *capabilities*, occasioned his well-known nickname of *Capability Brown*. The perfection of self-complacency was certainly expressed in his exclamation on beholding one of his artificial rivers—"Thames! Thames! thou wilt never forgive me!" These were the rivers which Sir Uvedale Price says might be exactly represented in linen upon a bleaching-green. His actual merits were confined to his being a good gardener. Some of his reforms in that department are entitled to all praise. It was only when he endeavoured to improve *grounds* that he erred. There he had but two or three ideas to act upon, and he acted upon them in all circumstances unrelentingly. One was to dispose trees in clumps and belts, the clumps generally balancing each other, and the belts pursuing a meagre line of miles in length; another was to make up similative rivers, by damming up little rills and giving them smooth sloping turf banks. While waging war against the grand avenues, terraces, square-walked gardens, and other fine old artificialities connected with rural mansions, he unfortunately had no inclination or power to put the genuine forms of nature in their place. He disrespected nature, or only thought that she was *clever sometimes*. If possessed of the means, he would unquestionably, if we may judge from the traits of enthusiasm that occasionally burst from him, have had the whole surface of the earth made like one of his dressed places. He was vapouring one day about the extent to which his plans had already been carried, and his hope of seeing them farther extended before he died, when a wit said gravely, "Mr Brown, I very earnestly wish that I may die before you." "Why so?" said Brown, with great surprise. "Because," said he, "I should like to see heaven before you had improved it."

The Essay on the Picturesque occupies but a part of the volume, and perhaps the least valuable part. For of what practical importance is it to settle the exact nature of the picturesque, as distinguished from the beautiful—its partaking of irregularity and variety of outline, its standing half-way between the beautiful and sublime, and so forth. One joke of an eminent clerical wag settles the whole matter—"The *rector's* horse is usually the more beautiful—the *curate's* the more picturesque." [Why has not Sir Thomas, at least, put this amongst the additional illustrations?] Under the same boards we have Sir Uvedale's Essays on Artificial Water, on Decorations, and on Architecture and Buildings, all of them admirable expositions of sound principles upon these subjects. It may be remarked that the essayist was unacquainted with theories of beauty, but contrives, notwithstanding, to write with an amazingly convincing effect on most of the points which he takes up.

The custom of the seventeenth and earlier centuries was to have a house immediately surrounded by various subordinate buildings, and also by gardens, terraces, flights of steps, and other architectural objects. The Kent and Brown tastes swept these things away, and made the lawn come up to the bottom of the walls. Now, it is, we think rightly, contended that a house being necessarily an artificial object, there is no impropriety, but the reverse, in having it immediately surrounded by objects more or less artificial. The balustraded terrace for a walk is a fine object from a distance, and as well entitled to be there as the house itself. The true plan seems to be, to have such objects immediately near the house, and to allow the environs to melt gradually into the ordinary country. "My rule," says Sir T. D. Lauder, "would be, that the house and its subsidiary buildings should be directly associated with designs of a character which may have much of architectural regularity, as well as actual architectural feature about them. By this means the house itself not only becomes a more pleasing object to look at from all points, but the different views enjoyed from it become much more interesting, from the enrichment of the foreground by minor architectural objects. Straight-lined terraces, bowling greens, balustrades, vases, sun-dials, architectural seats, fountains, and statues, mingled with a profusion of shrubs, plants, and creepers, are all appropriate and useful decorations in such a place. The more formal trees, such as cypresses, Lombardy poplars, Irish yews, &c., come well into harmony with the architectural design, and, in some instances, box-hedges may be desirable, especially where they are contrasted with shrubs of a freer growth—the general design being to produce that intricacy and richness which beget interest, and to furnish an assemblage of objects to throw back the distances. Happy is the man who has had the luck to have a travelled ancestor, who may have imported the taste of such a garden from Italy, and who may have had the energy to construct one around the family dwelling, provided the more immediate predecessors of the living owner have had the good sense to leave it entire. Such a legacy is a perfect treasure to an old place, filled as it is with its many associations—with those groups of gentle knights and ladies fair, who, in different ages, have lounged upon its seats, listening to the soothing murmur of its fountains, or talked of love, or other important trifles, as they moved along its terraces in all the glory of their gay attire, rivalling the very butterflies that participated with them in the sweets of that Flora which perfumed the air around them. A newly constructed garden of this description can have no such direct associations. But still it must possess a sort of reflective association of this description, from recalling the recollection of those which existed in the olden time, together with all the ideas connected with them. And its effect, in relation to the more distant landscape and grounds, must be the same, the moment its various parts are so grown up as to perfect the design." And further—"I know of one ancient garden of this description, that belonging to the old house of Barncleuch, near Hamilton, the property of Lady Ruthven, which I visited with extreme satisfaction and delight. The house stands on the brink of a steep and lofty bank, hanging over the river Avon, at a point a little way above its confluence with the Clyde. The bank is cut out and built up into terraces of different degrees of level, which are connected by flights of steps, and decorated by fountains, arched recesses, stone seats, and all these adjuncts usually found in such old domestic gardens; and the whole is thus softened into the happiest gradual combination with the wildness of the neighbouring scenery. The history of the original formation of this garden is very curious. It was constructed by that Lord Belhaven who lived about the middle of the seventeenth century, of whom Nicol, in his Diary, gives us the following very strange history:—

'It is formerlie observit, that the Inglisches haiffing routtit this natioun at the fight at Dunbar, upone the 3d September 1650, the possest this kingdome, and did foirfalt the maist pairt of these that wer ingadged in that unlauchful ingadgement in the Scottis ingoing to England; among quhome the Dukes of Hamiltoun, and all that formerlie were forfalt, the creditouris persewit the cautioneris for the duke's dett and could get no relieffe. Among these cautioneris the Lord Belhevin being one, and being band for that hous in greater sumes of money than he was able to pay, he resolves to leave this natioun, that he mycht eschew comprysinges of his landis and imprissonement of his persone. This resolutioun he followes in this manner. He takis his jurney to England, and quhen he past by Silloway (Solway) Sandis, he causit his servand cum bak to his wyff with his cloak and hatt, and causit it to be vented that in ryding by these sandis, both he and his horse quhuairon he raid wer sunkin in these quick sandis and drowned, nane being privy to this bot his lady and his man servand. This report passed in all pairtes as guid cunzie, that he was deid and perisched, for the space of six yearis and moir; and to mak this the moir probable and lykelie, his lady and chyldrene went in dule and murning the first two yeiris of his absens, so that during these six yeiris it was certifyed to the haill cuntrey that he was deid and perisched; all this wes done of set purpos to eschew the danger of the cautionary quhairin he lay for that hous of Hamiltoun. Eftir his ingoing to England, he strypit himselff of his apperell, clothed himselff in ane base servill sute, denyit his name, and became servand to ane gairdner, and laborit in gardenes and yairdis during the haill space of his absence; na person being privy to this cours bot his lady (as for his servand he went to other service, not knowing that his old lord haid becum a gairdner) till efter six yeiris absens; efter quhilk tyme and space the Dutches of Hamiltoun haiffing takin ordour with the dettis, and compereit and aggreyit with the creditouris, than he returned to Scotland in Januar last 1659, efter sex yeiris service in England with a gairdner, to the admiratioun of many, for during that haill space it was evir thocht he wes deid, no persone being accessorie to his secrecy bot his awin lady to hir great commendatioune. By this meanis his landis and estait wer saiff, and his cautionarie for the hous of Hamiltoun wes transactit for, as is afoirsaid, and his estait, both personall and reall fred and outquytt.'

I believe that it was owing to my friend Mr Kirkpatrick Sharp having on one occasion directed Sir Walter Scott's attention to this most singular story, that the first idea occurred to the great author of the 'Bride of Lammermoor,' that he should terminate the existence of the Master of Ravenswood by a death similar to that which was thus feigned by Lord Belhaven, and which Sir Walter has made so sublimely affecting as the final fate of his hero. But the object which I have most particularly in view, in my present introduction of this piece of history, is that I may be enabled to mention, that it was the knowledge which Lord Belhaven thus acquired, during his six years' hard horticultural labour in England, that enabled him to lay out and construct this beautiful old terrace-garden of Barncleuch."

With regard to the decoration of grounds more remote from the house, it is impossible for us in this place to follow critically the ideas of Price; but we shall extract one of the editor's additions:—"Before proceeding to plant the grounds of a place ornamentally, it is necessary carefully to study its character—to become thoroughly acquainted with the various inequalities of its surface—to consider, also, the different soils which present themselves; and after well digesting all these particulars, let the improver then bestow some thought upon the question, how nature would have done the work, had she been pleased to have executed it. Here I am presupposing the existence of two things: first, that the place has some variety of surface; and secondly, that the improver has studied the wooding of nature, which is still abundantly to be met with in all the wilder parts of our own country, especially in Wales, or in the Highlands of Scotland—as, for example, in the valleys running down in all directions from the Grampians, where the beauty of the natural woods is so very remarkable. If the place is so utterly devoid of variety of surface as to be absolutely a dead flat, and if it has no timber on it already, the existing arrangement of which might suggest to the improver some design for ultimately producing intricacy and interest, I should be disposed to advise the proprietor to fix his residence elsewhere. But if he is reduced to the necessity of settling there, by having no other choice, I should say that the best advice that can well be given him, is to plant and spare not; so that, although he may be able to do nothing very effectual in producing beauty, he may at least have the gratification of seeing his trees grow, with the hope of leaving behind him something which his son or his grandson may work into a place. He should always bear in mind that trees are more easily removed than reared, and that there is more hope of a place where the house stands in the middle of a forest, than there can be where it appears staring in

* Edinburgh: Caldwell, Lloyd, and Co. London: Orr and Co. 8vo., pp. 386. 1842.

the midst of a bare plain, without a single tree within view. But in planting—whether in the smaller groves or larger woods—the different kinds of timber trees should not be mixed, so as to produce one general *uniformity of variety*, if I may so express myself; but, for the most part, though perhaps not always, the individuals of each kind should be grouped together in considerable masses, irregular both in form and size. And as I should rather prefer an over-doing than an under-doing of wood at first, so I should wish the proprietor to be early alive to the necessity of making frequent inroads upon the outline of his groves and woods, by carrying glades into them in certain places, and loosening their edges in others, so as by degrees to give air, that is, relative distance, as well as nature, to the whole scene. But the attempt to convert so utterly flat and unfavourable a subject as that which we have now supposed to exist, is rarely to be made."

Here our limited space compels us to stop, and we can only recommend the volume to the careful perusal of gentlemen interested in laying out pleasure grounds on principles of taste: its great elegance makes it a fit companion for the drawing-room or parlour.

"A SHILLING'S WORTH OF NONSENSE."

In an exceedingly droll little production, appropriately enough entitled as above, which has just made its appearance, and, as it may be supposed, with the laudable view of making people laugh in these "dull times," we find the following quizzical observations and advices, which a cautious critic would say "were not bad."

LAWYERS.

A lawyer is a "much-abused gentleman, one," &c. He is generally described as a cormorant after clients, exorbitant in his bills of costs, and a zealous promoter of litigation; but this portrait of him has been drawn with a too caustic pencil, for there is a high moral purpose in his conduct.

He desires clients only with the noble motive of ruining them, and holding them up as examples of the miserable state to be anticipated by those who show a vexatious spirit towards their fellow-men. He makes law expensive, not from a paltry desire to enrich his own coffers, but from a magnanimous and patriotic wish to prevent the poor man from indulging in hatred and uncharitableness, and to deter the rich, by a forcible appeal to their pockets, from a habit of oppression towards their inferiors, and of opposition towards their equals; therefore, let the costs of your legal adviser be ever so exorbitant, discharge his claim at once, and consider that you have only taken an expensive lesson in morality.

If the lawyer does promote litigation, it is from the consideration that a country without a chancellor would be little better than a ship without a helm; and living in a country *with* a chancellor, he looks upon it as the bounden duty of every one to prevent so honourable a functionary receiving his money for doing nothing.

PICTURES.

"Know thyself," is an excellent axiom and round-hand copy. We would therefore recommend the heads of families to have themselves transferred to canvass, and suspended in their apartments for continual self-examination. There are also other advantages attendant upon this practice. As it would be too expensive to appear every day in your best clothes, the portraits of yourself, in blue coat and buff waistcoat, will afford those friends who have an opportunity of seeing you only in the week in your working dress, of observing how very genteel you appear when decorated in your Sunday apparel. Should you be blessed with two grown-up, unmarriageable daughters, you cannot do better than have their portraits "done," for the artist can introduce a stock of jewellery and beauty not exactly the property of the young ladies; and as first impressions are everything, some guileless swain may be struck with the charms of the portrait, and blinded to the blemishes of the original.

If we were called upon to suggest a style of male portraiture, we would unhesitatingly select that of the gentleman in Regent Circus, who, in a spirit of laudable ambition, has set up his own likeness in rivalry to that of his neighbour, the "Bull and Mouth." There is a *landscape* of a child in the same gallery which offers a fine model for the female portion of your family, always taking care to place in the hand of the fair sitter a rose, or, in the absence of the floral queen, a kidney on a skewer, which, we are given to understand, is the *lay-rose* of this school of painters.

Persons of considerable wealth but of insignificant extraction, who, in the poetic ardour of their youth, have been imprudent enough to allow the "home of their childhood" to be committed to canvass, will do well, upon the acquisition of their first thousand pounds, to have the humble cottage in which they were born instantly converted into a villa; and with every new investment in the funds, they should employ some architectural artist to add a wing or a storey to their pictorial birthplace, in order that it may ultimately be converted into a mansion. On retiring from business, a pound or two may be advantageously laid out in adding "an extensive and thickly-wooded park, well stocked with deer," to the picture; so that, although your youthful fare may have been broad-beans and bacon, your new acquaintance may give you credit for having been reared on venison and pine-apples.

INTELLECTUAL COMPANIONS.

In selecting your companions, be careful to choose those who are your inferiors either in mind or position. Ambition is a noble principle; and be your talents however humble, you can, in seeking your station in society, descend to that class where you will be looked upon as a great man. In support of this opinion, we need only refer to that beautiful spirit of humility which now actuates some of the nobles of our land, who, doffing the *pseudo* dignity of the senator, and donning the generous nature of the man, are frequently found taking the hand of the prize-fighter as a brother, and sharing in the festivities of the cabman as a friend—amply repaid for their condescension by the eulogiums of their companions, and their acknowledged superiority as—"regular bricks."

There is always danger of annoyance in presuming to seek the society of your superiors; for though you naturally entertain a very excellent opinion of yourself, it is ever distressing to find others that are not of the same way of thinking. As every thing is great or little by comparison, you may become a Colossus among coal-heavers, although you would be a pigmy among philosophers—even as the noble may be considered a genius in St Giles, who appears very much like an imbecile in St Stephens.

HABIT.

Habit being universally acknowledged to be second nature, he who wishes you to forego the indulgence of any of your established customs, can be looked upon only as one of those individuals who are irrational enough to desire that which is unnatural. If, therefore, you are in the habit of smoking, and occupy apartments in a house wherein there is an elderly lady with an asthma, and she is so unreasonable as to expect you to deprive yourself of this innocuous enjoyment, do not hesitate to treat her as a maniac, who would require you to exist without the very air you breathe. Should you have always accustomed yourself to plenty of air, and chance to occupy the inside of a stage-coach with a gentleman subject to rheumatism in the head, and a lady afflicted with the toothache, stand upon no ceremony, but proceed to establish a thorough draft by letting down both the windows; for recollect that none but barbarians would seek to control the dictates of nature—even though it be a second one. If you be one of twenty in a public room on a frosty morning, and have contracted a habit of warming the dorsal part of your body, do not hesitate to place yourself immediately before the fire, for there can be no necessity for you to inconvenience yourself for those to whom you are a perfect stranger; or should there be any friends of yours among the company, it would evince great selfishness upon their parts did they display any wish to control your enjoyment.

SOCIETY IN A WEALTHY MERCANTILE ENGLISH TOWN.

To say that in a place singularly destitute of nobility its inhabitants have themselves substituted an aristocracy of wealth in place of one of family, is perhaps a little beyond the precise truth; and yet it comes nearer to the truth than any other form of words which could be used. There is as much subdivision into sets and sects, as much exclusiveness, with all its train of bad consequences, as in the wider and nobler circles of the metropolis—and over all, and through all, a mercantile spirit at work, which is singularly unfavourable to the development of mind. There is, indeed, scarcely any inducement for a man to exert and improve the powers with which he has been gifted, if, valuing every thing by the standard of pounds, shillings, and pence, he feels that his standing is secure, that he may talk wisdom or folly as he will, and still be looked up to in society as a person of consequence and authority; nay, that he is in most circles more popular as he is than he would be were he to bear the character of a hard reader or a deep thinker. The withering influence of fashion has also its share in depreciating the standard of intelligence. Our circles are not wide enough to allow of individuals setting up as characters—in which case alone does she tolerate any originality of thought, word, or deed; she therefore imposes upon her subjects a uniformity of conduct and manner; trammelling them as effectually within her artificial ordinances as the conjuror when he confines the chicken within his magic circle of chalk. But it seems to me that we are fallen on particularly cheerless times as respects ease or enjoyment in general society. As far as concerns the men, the age of dandyism has, thank Heaven, passed over. But though the present race of men may be less finical than the last, poor society is no gainer by their increase of manliness. If they are less sedulous attenders of balls than their predecessors, they are more constant at dinner parties; and at these they love to herd together, to talk the strong talk of emptiness—of their dogs, and horses, and amours—and to settle the great questions of the day—over which statesmen are racking their brains, and for the right understanding whereof philosophers are patiently drawing their conclusions from the experience of the past—in a few stout words, against which there is to be no appeal. As to pursuit of any kind beyond the above-mentioned amusements, it is almost utterly unknown among them; and even should any one be followed in secret, it is not to be alluded to in conversation, if its follower would keep clear of the artillery of idle tongues ever ready to satirise what their owners do not comprehend. On the other hand, the present system of female training has its share in making society a burden instead of an excitement and an exercise to those who understand something better than vapid talk about the nothings of the day, or the more racy amusement of quizzing your *vis-à-vis* in a quadrille. While fashion attacks any tendency to bluism with her most blighting ridicule, and inculcates a cold *posé* demeanour, under which every natural impulse and feeling is to be impenetrably concealed, education has parcelled out the time of her victim, and carried her at set hours from French to history, from history to music, from music to metaphysics, and so on, without ever stopping to study the natural biases and talents born with her. Between the two, the natural buoyancy of girlhood—which never stayed to consider whether the laugh was a tone too loud, or the step a thought too quick, or the talk a shade too confidential—is as completely crushed as if it had never existed; and there seems now no longer any intermediate step between the child on her way to school, and the well-tutored, well-dressed woman, armed at all points for society, and equally proof against enjoyments and annoyances. It would be as ridiculous as false to say that we have not many who stand out in bright relief from amidst this general barrenness. But sectarian differences of religion and politics keep these much asunder; and the powers which they might individually employ for the edification of general society, are sadly cramped by the suspicious dislike wherewith the world of commonplace people regard them: a world unjust as it is vain, and at any time more ready to overlook moral defect than to forgive mental superiority.—*Chorley's Sketches of a Sea-port Town.*

THE COCA OF BOLIVIA.

The coca, which is so essential to the Indian's comfortable existence, is a staple of this climate. This plant, at the time of the conquest, was only used by the Incas and those of the royal or rather solar blood. The plant was looked upon as an image of divinity, and no one entered the enclosures where it was cultivated without bending the knee in adoration. The divine sacrifices made at that period were thought not to be acceptable to heaven, unless the victims were crowned with branches of this tree. The oracles made no reply, and auguries were terrible, if the priest did not chew coca at the time of consulting them. It was an unheard-of sacrilege to invoke the shades of the departed great without wearing this plant in token of respect; and the Coyas and Mamas, who were supposed to preside over gold and silver, rendered the mines impenetrable if the labourers failed to chew the leaves of coca while engaged in the toil. To this plant the Indian recurred for relief in his greatest distress; no matter whether want or disease oppressed him, or whether he sought the favours of Fortune or Cupid, he found consolation in this divine plant. In the course of time its use extended to the whole Indian population, and its cultivation became an important branch of trade. It produced at one period no less than 2,641,487 dollars yearly; and we are told that its leaves were once the representative of money, and circulated as coin. The virtues of the coca are of the most astonishing character. The Indians who are addicted to its use are enabled to withstand the toil of the mines, amidst noxious metallic exhalations, without rest, food, or protection from the climate. They run hundreds of leagues over deserts, arid plains, and craggy mountains, sustained only by the coca and a little parched corn: and often, too, acting as mules in bearing loads through passes where animals cannot go. Many have attributed this frightful frugality and power of endurance to the effects of habit, and not to the use of the coca; but it must be remembered that the Indian is naturally voracious; and it is known that many Spaniards were unable to perform the Herculean tasks of the Peruvians until they habitually used the coca. Moreover, the Indians without it lose both their vigour and powers of endurance. It is stated, that during the siege of La Paz in 1781, when the Spaniards were constantly on the watch, and destitute of provisions, in the inclemencies of winter, they were saved from disease and death by resorting to this plant. The coca possesses a slightly aromatic and agreeable odour, and, when chewed, dispenses a grateful fragrance; its taste is moderately bitter and astringent, and it tinges the saliva of a greenish hue. Its effects on the system are stomachic and tonic, and beneficial in preventing intermittents, which have always prevailed in the country. The mode of employing coca is to mix with it in the mouth a small quantity of lime prepared from shells, much after the manner that the betel is used in the east. With this, a handful of parched corn, and a ball of arrow-root, an Indian will travel on foot a hundred leagues, trotting on ahead of a horse. On the frequented roads, I am informed that the Indian guides have certain spots where they throw out their quids, which have accumulated into little heaps that now serve as marks of distance; so that, instead of saying one place is so many leagues from another, it is common to call it so many quids!—*Three Years in the Pacific:* 1835.

AN ENGLISH STREET DIALOGUE.

A. (*advancing*) How d'ye do, Brooks?
B. Very well, thank ye; how do *you* do?
A. Very well, thank ye; is Mrs Brooks well?
B. Very well, I'm much obliged t'ye. Mrs Adams and the children are well, I hope?
A. Quite well, thank ye.
(A pause.)
B. Rather pleasant weather to-day.
A. Yes, but it was cold in the morning.
B. Yes, but we must expect that at this time o' year.
(A pause—neckcloth twisted, and switch twirled.)
A. Seen Smith lately?
B. No; can't say I have; but I have seen Thompson.
A. Indeed! how is he?
B. Very well, thank ye.
A. I'm glad of it. Well, good morning.
B. Good morning.

Here it is always observed that the speakers, having taken leave, walk faster than usual for some hundred yards.—*Scrap-book.*

We are continually receiving letters from persons in country towns, particularly in England, complaining that they cannot, by any possibility, get certain back numbers of our Journal; the answer given by the booksellers being, that the numbers are out of print. We can only re-assert, that there are, at all times, from 500 to 1000 copies of each number from the commencement in our own warehouse at Edinburgh, and also in the warehouse of Mr W. S. Orr, Amen Corner, London; and that, if country booksellers would give themselves the trouble of sending to either of these head depôts, they would invariably get what they require. The error, perhaps, lies in the booksellers trusting to other parties to remit what they want. We have frequently similar complaints as to the impossibility of getting works in our Educational Course, School-Room Maps, &c., and the same thing may be said respecting them—there is always a large supply of every one of these works in the hands of Mr Orr, and also with ourselves.

NUMBER 550. SATURDAY, AUGUST 13, 1842. PRICE 1½d.

LAMENT FOR AN EXTINCT ARTICLE OF FEMALE DRESS.

In our younger days, when George III. was king, ladies wore pockets—particularly those ladies whose exterior clothing consisted of a husband. But, some years since, this article of female attire, which had existed perhaps from the beginning of the world, was universally discarded, and its place supplied by a certain trifling dangling pretence for a pocket, styled and yclept a *reticule*. If you now inquire how ladies do without pockets, they point to the reticule as that which serves in its stead, and seem to think the one thing a thorough compensation for the other. But suppose you were to burn down the custom-house and erect a sentry-box in its place, you might just as well pretend that the sentry-box was a compensation or substitute for the custom-house. The reticule is not, and never can be, a fair representative of the honest, substantial, capacious, commodity, which our respected ancestresses wore by their sides, one to balance the other, somewhat after the manner of a pair of saddle-bags, while near by depended a pin-cushion of about the size of a reasonable school globe, a goodly pair of scissors, and a venerable article called a *hus'if*, containing specimens of all sorts of needles from darners downwards. Pockets, in fact, *were* pockets—vessels of extensive capacity and serviceableness; which reticules never can be. The manifest fact is that, in the rage for elegance, pockets were found by the ladies to give a bunchiness to the contour, and for that reason were discarded, notwithstanding their merits on the score of utility. And thus, for the sake of a slimness, which in married ladies is not desirable, a revolution of the most annoying and even disastrous nature has been effected in the household system of Great Britain and Ireland.

We speak quite advisedly when we attribute such a grave character to this change of fashion; and this, we trust, will be fully acknowledged by our readers. Let us just consider for a moment what ladies' pockets were, and what they did, and what associations of feeling they gave rise to. In the first place, the pockets of the mistress of a household and mother of a family used to be an ever-ready and convenient place of reference for all sorts of moderate-sized articles, which there might otherwise have been a difficulty in finding when they were wanted. You never could be at a loss for a cork-screw long ago: the mistress was sure to have one in her pocket. No need then for a hurry-skurrying through the house in search of a shoeing-horn to relieve the agonies of an urchin putting on a pair of new shoes: his mamma had the article at command in a moment, and the starting perspiration was instantly repelled. Her pockets were, indeed, a kind of microcosm—an epitome of all that was in the store-room, the dark closet, and even the larder. The only drawback was, that when she was from home, half the miscellaneous articles of the house might be considered as from home too; but, then, the ladies of those days went so little abroad! In the second place, the said pockets were a depôt for a vast number of small stray articles, which are constantly seen now-a-days wandering about the house in danger of being lost. If a dame of those days saw so much as a child's marble lying in a corner, she picked it up and clapped it into her pocket. Did she discover a single little stocking in some irrelative place, like the foot-print on the sand in Robinson Crusoe, she popped it into her pocket. Did she find a teaspoon or sauce-ladle where no such thing should be, it took the same road. Any toy which had served its day amongst the children, and was beginning, accordingly, to be an object for their destructiveness, she whipped out of their sight into that ever-open receptacle, well knowing that it might do good service hereafter, when it had once more become a novelty. The pockets were not the permanent receptacle for all such things; nothing short of a pair of panniers could have been so. But they served admirably as a commonplace book into which things could be entered for the time, to be afterwards at leisure distributed each to its own proper page in the household ledger.

The economy of all this, the saving of fret and worry which it effected, were what no subject born of Queen Victoria will ever be able to understand. To remind our contemporaries of only one article—how much vexation was spared to us long ago by the practice which ladies then followed of carrying their keys in their pockets, instead of, as now, keeping, or pretending to keep, them in a little moveable basket! In those days, everything was obtainable at a moment's notice, because the key which commanded its place of deposit was ever ready. The simple localisation of the keys of the establishment in one of those well-known pockets kept all right. But now-a-days who can tell one minute where a lady's keys are to be the next? Sometimes they are on her work-table in the parlour, sometimes they follow her to her bedroom, sometimes they are snug in a cushioned corner of the drawing-room sofa. Sometimes, strange to say, they seem to have locked themselves up into some place unknown, or, not less wonderful, are declared to be nowhere. We have known tea put an hour behind its time, merely because the keys had made to themselves wings. We have known a lady go out to dinner in a dress which was hardly dress, because access to her drawers had suddenly been found to be impossible. We shall suppose that a friend whom you have not seen for a long time has come home to dine with you, and that you wish, during the repast, to treat him to a bottle of very particular sherry which you have lately laid in. You issue the proper order; but, lo! the cellar key, which was in Mrs Balderstone's hands only ten minutes ago, if her own story is to be believed, can now no longer be found. Your friend, of course, is in the condition of Mother Hubbard's dog, as far as sherry is concerned, and sets you down for a very strange sort of person. Say, again, you meet with a severe accident, and, from loss of blood, are in a fainting condition. "For any sake," says the doctor, "brandy!" "Brandy!" every one repeats, and instantly all are flying about in quest of—not the brandy, but the keys wherewith it is to be excavated from the wine-cooler. But you might as well call spirits from the vasty deep. The keys have, as usual, gone amissing, and the lock of the wine-cooler, cupboard, or whatever other place, is inviolable. Probably, you have been in seven faints before they are at length found, and the desired article produced.

One of your children is severely burnt. "Oil! oil!" is the cry. But where is the oil? and echo answers—"Where?"

You meet both your servant-girls rushing down the staircase in the greatest haste. You might as well try to stop a whirlwind; but you question them in passing: "Where—where are you going? What in the world are you after?" "The keys! the keys!" Even the little boy who cleans the knives and goes upon errands, is in a state of extraordinary excitement. His mistress's injunctions are upon him, and he has not a thought for anything else. At last, with one eye charged with merriment, and another directed towards a drawer which he has pulled out from the drawing-room table, he ejaculates—"Mistress—mistress—there they are!"

Another case is of such constant occurrence that it has almost ceased to be remarkable. You have sat down to dinner, and all is ready, except the attendant whose duty it is to remove the covers and wait. "Where, where is Mary? Why is she out of the way just now?" "Oh, just have a little patience, my dear; she will be here immediately." You determine to be liberal, and allow a minute. Still no Mary appears. You begin to hear a hurrying across upper floors, and a skiffing up and down stairs. "What is detaining her? Why is she not ready to attend?" "Oh, do, dear, wait a little longer," says Mrs Balderstone, herself beginning to be a little uneasy. Mary at last comes down out of breath, bearing that signal of your bale—*the basket of keys*—of which she has, as usual, been in quest, at the command (secretly given) of her mistress.

You lose at length all patience, and take an opportunity some day of telling your spouse a very plain tale; but it is all in vain. Somehow, fifty such incidents as the above impress her mind with the idea of but one occurrence. She admits that some such annoyance happened *once*, but no more. Your asserting that it is of frequent occurrence she takes in great dudgeon, and it is well if she does not end by making herself appear as the injured party, and require a present to dry up her tears withal.

After so many thorough out-and-out grievances, it may almost appear silly to lament the extinction of ladies' pockets on account merely of the pleasant ideas associated with them. Yet, since our hand is in, we must advert to this part of the case also. Every person of maturish years must have delightful recollections of the interest which used to attach to those honest-like swelling receptacles which hung once by the sides of mothers and grandmothers, not to speak of worthy aunts and grand-aunts, and miscellaneous lady visiters of philoprogenitive dispositions—sure as they were to contain a greater or less store of all the things which children delight in. Reticules never contain coppers—pockets did. Reticules never turn out any such things as comfits or nuts—but pockets were always doing kind actions of that sort. A lady of the old time, who had anything to do with children, always took care to keep her pockets well plenished with such little matters, to be employed at all proper seasons and on all needful occasions, as prudence might direct or importunity extort; and thus was a charming bond established between the adult and the young which cannot now exist in nearly the same intensity. Why, we have seen a lady at a friend's table laughingly appropriate, with the full consent of the hostess, the reversion of a whole dessert, consisting of perhaps a pound of raisins, half-a-dozen apples, and a section of cake fit to set up a tea-party, and tumble all into her pocket to be taken home "to the bairns." Verily, different times was it with younkers in those days, from what it is at present under the reign of reticules! Here is one great source of mutual love lost to society. Who can tell what may be its effect in future years, as the people that have been born and reared under the reticule régime grow up and take their part in the social and political world! A most interesting race they were, altogether, those lady-pockets of a former day, with their curious difficulty of access through vertical apertures in the intermediate integuments, and the various external characters which they were always found to bear in accordance with the characters of the owners. It must be remarked, for the information of the youthful part of the community, that every lady had a pocket in some degree appropriate to her age and position in the world. A youngish lady had but a

slight thing of dimity, or some such article. When she grew into a married woman, her pocket grew too, and became of stouter consistence and more bulk and capacity, to suit her new necessities. As her family increased, so did her pocket, until at length, about the time when she proved a grandmother, it had become thick, and strong, and wide, and large, and more like the buckler which a warrior carries by his side than anything else. Some pockets were much more inaccessible and stingy than others; but with a swelling heart we must do them the justice to say that generosity was the predominant character of the race. A mother's pocket contained a reward for every good deed or service, and a balm for every wound and every woe. It was almost worth while to get a dreadful cut or bruise, in order to experience the unfailing solacement which that pocket could supply. A grandmother's, again, although perhaps of homelier stuff, was even more liberal of its good things—grandmothers being fortunately exempt from all those anxieties by which parents allow themselves to be tormented, lest they should spoil or over-indulge the young. We have known a little elf watch an elderly lady visiter of his mother for hours, like a cat at a mouse-house, eyeing every movement which her hand took in relation to her pocket-hole—now disappointed by her taking out only her snuff-box; now by her drawing forth her seam that she might fall a-working, in order to improve her time; but rarely failing to have his assiduity rewarded in the long-run by some proof of her generosity. When we reflect on the feelings of the juvenile world of thirty years ago on all these matters, and consider that such things are known no longer, we could almost conclude that the banishment of the weeping birch, the explanations given to difficulties at school, and all the other advantages which the youth of the present day enjoy, or are said to enjoy, hardly form a compensation for the banishment of the ladies' pocket.

SKETCHES IN NATURAL HISTORY.

PARASITICAL ANIMALS.

THE existence of parasitical animals, that is, of tribes of creatures which live in and upon other animals, and extract their nourishment from these, is one of the most curious and remarkable phenomena which the history of the animal kingdom offers to our notice. The extent to which these parasites prevail is infinitely greater than is usually imagined. There is not, perhaps, an animal, to what rank soever of the zoological scale it may belong, altogether free from their attacks; many are liable to be assailed by large numbers indiscriminately, while not a few have one or more peculiar species assigned to them. Neither is almost any portion of the animal frame exempt from their visitations. Many take up their abode on the skin, among the hair, feathers, or other materials with which it may be covered, dig nests for themselves in its substance, or find some other suitable residence on the exterior parts of the body: the whole of the extensive tribe, named *Entozoa*, live in the interior of animals—in the brain, liver, lungs, intestines; in short, in almost every part of their viscera, frequently producing serious and fatal diseases. Nay, so complex does the system of parasitical life sometimes become, that we find numerous instances in which one parasite is preyed upon by another, and that again by a third, the process being thus continued through three separate stages.

In many instances we are incapable of forming a proper estimate of the purposes which these creatures are designed to serve; in others the object is more apparent; while in not a few cases we see in them a benevolent provision for a specific end. Many of the races of what are called the lower animals—insects, for example—have a great tendency to superfecundity; that is, to increase beyond due proportion, and surpass the limits which have been assigned them in the economy of nature. By means of these parasites, which are by far the most numerous in such tribes as those just alluded to, a series of checks and counterchecks are established, this exuberant fertility restrained, and a due equilibrium kept up among the different races.

Man himself, to whom dominion over the whole of animated nature has been assigned, as the peculiar privilege of his superior endowments and high destinies, is very far from being in a condition to boast of immunity from the attacks of these assailants. Four species of *Pediculidæ* (speaking in reference to this country only) are liable to infest the exterior of his person; and these, under peculiar circumstances, and in connexion with *Acari*, have sometimes been known to produce fatal diseases. To the malady known by the name of *morbus pedicularis*, the rich, the wise, the noble, and the mighty, have fallen victims. Exclusive of other names of less note are those of Pheretima, as recorded by Herodotus, Antiochus Epiphanes, the Dictator Sylla, the two Herods, the Emperor Maximian, and Philip II.* These, however, are but an insignificant portion of the parasites which make man at once their residence and their food. Upwards of 20 species have been enumerated as living in some portion of the interior of his frame. Some penetrate, to use Kirby's words, into the very seat of thought; others disturb his bile; others circulate with the blood of his veins; others, again, are seated in his kidneys; others in his muscles, &c. Nor is the diversity of the species more remarkable than the occasional numbers of the same species, and the enormous dimensions which others sometimes attain. Eight hundred and seventy parasitic worms have been counted in one liver; tapeworms have been known to extend to 30 feet in length, and even in some instances, it is asserted, to 128 feet! In tropical countries the natives are liable to the attacks of a gigantic parasite, known by the name of the Guinea worm (*Filaria medinensis*), which insinuates itself within the skin of the legs, where it occasionally continues for many years, sometimes without producing much pain, at other times causing great agony, according to the place it occupies. It is said to attain the length of ten feet, and the thickness of a pigeon's quill. The patient is on the watch for a portion of its body appearing through the skin, when he seizes it and draws it forth with great slowness and caution, for fear of breaking it. The Jigger (*Pulex penetrans*) of intertropical countries is infinitely more troublesome than its counterpart (*Pulex irritans*) in the colder regions of the earth; for it burrows into the flesh of the feet, and soon swells into a large ball, the latter being a membranous bag containing the eggs. When the young issue from it, they produce a severe ulceration, which is always difficult to cure, and sometimes proves mortal. According to Humboldt, there exists in South America a species of gad-fly (*Œstrus hominis*) which deposits its eggs on human beings, and there rears its young as its natural and appropriate habitat.

Not a few of the above-mentioned parasites likewise occur in and upon various kinds of mammiferous animals; and there are, of course, many others peculiar to the latter. Almost every species of quadruped has its own pedicular inhabitant; and not only so, but in some instances different kinds are appropriated to different parts of the body. This is the case, for example, with the common ox; and this animal presents the farther peculiarity, that it has a distinct species allotted to the young. These considerations, in a physiological point of view, are not a little remarkable. Most of our domestic animals are very subject to the inroads of parasites, probably in some measure in consequence of the changes they have undergone in their food and habits by the process of domestication. To enumerate all these would extend this notice beyond due limits, and lead us to trespass on the province of the veterinary surgeon. One of the most common is what are called *hydatids* in sheep, which often prove very injurious to that useful animal. *H. cerebralis* infests the brain, producing vertigo or sturdy; and the presence of the parasites may be known by the state of disquietude into which the animal is thrown, frequently turning its head to one side with a sudden jerk, running quickly forward without any apparent cause, then suddenly stopping as in a state of bewilderment. The fluke-worm (*Fasciola hepatica*) is very common not only in the liver of the sheep, but also of the other ruminating animals—of the pig, and even occasionally of man himself. It has the form of a small oval leaf, pointed behind, and having a narrow elongation in front, on which the first sucker is placed, opening into a kind of throat supplied with canals for conveying the bile—on which the creature feeds—into all parts of its body.

In the whole tribe of parasites, there is not, perhaps, one whose history altogether is more curious and interesting than that of the gad-fly, which produces bots in horses. This fly is about the size of the common blue-bottle fly, and of a yellowish-brown colour; the female provided with a tubular instrument terminating in a hook, for depositing her eggs. Having selected the horse to which she is to intrust her progeny, she hovers over him with an egg in the pincers at the extremity of the anal tube, and on the first favourable opportunity pounces upon him, and deposits the egg on a hair, to which it adheres by a glutinous matter with which it is coated. This done, the maternal duties of the parent fly cease, and the egg is left to the singular series of vicissitudes it is destined to undergo. It must be hatched in the interior of the horse, and the latter becomes the unconscious instrument of conveying it thither. When licking himself, as horses are apt to do when grazing, urged thereto by the bites and titillation of various flies, the eggs of the gad-fly adhere to his tongue and lips, and thus readily find their way into the interior of the mouth. To render this desired result the more probable, the eggs are usually laid on the fore-quarter of the horse, in such places as he can reach with his tongue; but even when this is not the case, the eggs are not necessarily lost, as horses are in the habit of licking each other, and one free from bots may thus receive them from another. The warmth and moisture of the mouth soon cause the larvæ to burst through the envelope of the egg, and they are either swallowed with the food, or find their way into the stomach by their own proper exertions. They have now reached their appropriate receptacle, the domicile where they are to spend the principal portion of their lives. In shape, they are not unlike some kinds of powder-flask, the segments with short spines on the edges, and the anterior terminating in a narrow neck, which has two hooks at its extremity. By means of these they anchor themselves to the internal membrane of the stomach, where they feed upon the humours secreted by that membrane, wholly uninjured by the gastric juice, and retaining their position amid all the changes which the great central organ of nutrition undergoes. They generally occupy their genial quarters (the temperature of a horse's stomach is about 102 degrees Fahrenheit) upwards of half a year, when they let go their hold, and allow themselves to be ejected, with the digested food, through the ordinary channel. They are then transformed into a chrysalis on the ground, from which, in due time, the fly emerges, to give birth to another offspring, which repeat the same extraordinary cycle of changes.

The gad-fly of the ox rears its young on the exterior of that animal, depositing its eggs on the skin. When the larvæ are excluded, they dig into the skin, and an abscess or tumour is formed around them, which serves both as a place of residence and a reservoir of food, the lymph generated by the irritation yielding the requisite sustenance. The gad-fly of the sheep differs in its economy from both of the above. It lays its eggs on the nostrils of the sheep, where they very soon hatch, and the larvæ find their way into the frontal maxillary and other sinuses or cavities of the face, where they produce a considerable degree of inflammation, and occasion great pain. The same helpless quadruped is frequently overrun with an apterous fly, called the *ked* or spider-fly; but perhaps its most formidable enemies are the common blow-fly (*Musca vomitoria*) and the grey chequered blow-fly (*M. carnaria*). In sheltered situations, and in sultry weather, these flies lay their eggs on the skin, wherever they can find a portion of it exposed; and if the surface be wounded, or the animal in a state of disease, so much better is it adapted to their purposes. Sometimes the larvæ are placed on the skin ready hatched—for these flies are viviparous, and they immediately begin to consume the flesh, and work their way into its substance. If the provident care of the shepherd does not prevent, large wounds are soon inflicted, exposing the viscera in many places, and the hapless victim perishes by a lingering death, presenting the revolting spectacle of being literally eaten alive.

The gigantic mammalia of the deep present, in the vast extent of their surface, "ample scope and verge enough" for the residence of entire colonies of smaller beings. We might suppose that their parasites would be larger than those occurring on animals of inferior dimensions; but this we do not find to be the case, at least in any considerable degree. One of the best known is named by sailors the whale louse (*Oniscus ceti*, Lin.) It is a curious crustaceous animal, with an oval body composed of eight or nine segments, with eight feet, each of which terminates in a strong claw. They are sometimes so abundant, that the whales infested by them are known to be so at a considerable distance by the white colour they impart to the surface, visible when the animal rises to breathe. When removed, the epidermis beneath them is generally found to be eaten away, and the superficial parts much injured. They receive the eggs, when excluded, into a kind of pouch, formed of scales, on the under side of the body, and they remain in this receptacle till hatched; even the young are carried about for a time in this bag, a practice which reminds one of the marsupial pouch of the kangaroo. There are several species nearly related to each other, but differing a good deal in their habits. One of them runs about the surface; others are stationary, and usually found in great numbers agglomerated upon the corneous eminences of the sperm-whale. Another animal somewhat resembling these, but belonging to a different tribe, that of the *Arachnida*, selects the same place of residence. It is about three-quarters of an inch in length, with a narrow body, and eight long many-jointed legs.

The bat parasite (*Pteroptes*) has often excited the surprise of those who observed it, both by its singular

* Denny's "Monographia Anoplurorum Britanniæ," a work just published, in which all the British species are described and beautifully figured. They amount to upwards of 230.

appearance and the extreme rapidity of its movements. It is considered to be an apterous (wingless) fly, although it bears much more resemblance to a spider. Living on the wing of the bat, and more particularly on the denuded part near the claw by which that animal suspends itself, it is very apt to be displaced; to enable it, therefore, to take a firm hold, its feet are furnished with a vesicle beneath, which it can employ as a sucker; and to afford it every chance of recovering itself when pushed from its place, it has the singular power of instantly turning its legs upwards, and walking, as it were, on its back. Nay, it can turn up, if it choose, only a portion of its legs at once, allowing the others to remain in the natural position, so that it can walk supported by two surfaces at once, and these on opposite sides of its body. The head is very small, and rises vertically from the thorax. Colonel Montague, to whom we are indebted for some curious observations on this animal, describes its motions, when confined in a small phial, as inconceivably rapid and agile.

Many kinds of curious creatures, similar to that last mentioned, and generally named spider-flies, live on different kinds of birds. They are, however, provided with wings; the body is flat, hard, and glossy; the legs large and strong, and furnished at the extremity with very powerful claws, aided by an apparatus of suckers. One of the largest of these (*Ornithomyia avicularia*) frequents poultry and game birds; another infests the house-swallow; a third resides on the swift; a fourth is appropriated to the various kinds of grouse, &c. Birds also sustain an immense host of pediculi, a peculiar species being in most instances allotted to each different kind, although a few range over a considerable number of birds. Mr Denny, in the work above referred to, has minutely described upwards of 200 species found on British birds. One of the most singular in shape, which Mr Denny terms "a beautiful parasite," is found plentifully on the peacock; another, not unlike it, is abundant on the turkey. The largest British species, of 3¼ lines in length, was found upon the hawk named the hobby.

The class of fishes has likewise its peculiar parasites, and these present us with many very curious examples of form and structure. Perhaps no fish whatever is without an *attaché* of this kind; but it has been observed that they are by far most numerous and formidable in fishes which are of the most ravenous nature; and it has been conjectured, with much appearance of probability, that this is with the design of impairing their activity and rendering them less extensively destructive to their weaker companions. We can notice only two or three of these fish-parasites. A very curious one (the *Aotheris percarum*) inhabits the perch. It is about 2½ lines long; the head and thorax forming only one piece, undivided by a suture; the abdomen with two oval bodies (egg-pouches) attached to it. It lives within the mouth of the perch—rather a perilous residence—where it not only runs the risk of being destroyed by the teeth, but of being bruised and carried into the stomach of the fish by the substances which the latter masticates for food. The apparatus by which it fixes itself is well deserving of notice. From the hinder part of what corresponds to the thorax, two strong cartilaginous arms take their origin, one on each side, and these are curved forwards till they meet in front of the head; just over the point where they unite is placed a cup-shaped sucker, of very distinct and regular form. By means of this sucker the animal fixes itself in the cellular membrane, and thus anchored, as it were, it is enabled to ride securely through any storm. It will be observed how admirably adapted this mode of attachment is for allowing perfect freedom of motion to the head and mouth.

The *Argulus foliaceus*, a crustaceous animal, is found upon various kinds of small fresh-water fish in this country, as well as elsewhere. The body is covered with a nearly circular shield, flattened above, and transparent. The legs are twelve in number, all of them feathered and pinnate, except the first pair, so that the animal can swim about with facility when it wishes to change its situation. The first pair of legs are converted into suckers, one of the most common and effective means of attachment among these creatures. The mouth is prolonged into a slender-pointed beak; and when the parasite has fixed his suckers, he thrusts this into the body of the fish, and sucks its blood. All efforts to throw off the creature are fruitless, and the poor fish often becomes its victim. Numerous other species similar to this are appropriated to different kinds of fishes, and there is scarcely any part of their body that is secure from the invasion of these troublesome foes. The gills, in particular, are infested by them. One species (*Tristoma coccineum*), upwards of an inch in breadth, and of a vivid red colour, attaches itself to the gills of the sword-fish; another (*Cecrops*) to those of the turbot; another (*Dichelestium*) to those of the sturgeon. These are fixed by suckers. A lernean worm (*L. branchialis*) has several branching horns surrounding its mouth, and with these it takes root, as it were, among the gills of the cod and haddock. *Lernea ocularis* attaches itself to the eyes of the herring; *Pennella filosa*, which is seven or eight inches long, penetrates into the flesh of the sword-fish and various other species, causing great pain. It may be remarked, that the sword-fish is more than usually subject to the attacks of parasites; and the fact of specimens being often found stranded, has led to the belief that they are at times tormented by them beyond endurance, and cast themselves ashore in despair, to rid themselves at once of their persecutors and their lives. These may serve for examples of the parasites which assail the finny tribes, without entering into the history of the numerous kinds which are more strictly internal feeders or intestinal parasites.

"BIZARRE FABLES."

A NEAT small volume, under the above odd appellation, which has just made its appearance,* deserves a word of notice. The author, who had previously given to the world a volume entitled "Jest and Earnest," appears to possess considerable powers of observation on men and manners, with a happy knack of weaving up little sketches or stories to which a moral may be applied. Wishing every success to this evidently clever writer, we beg to offer a specimen of his fables, which we trust will tempt the reader to procure the remainder for himself—shall we say, for *self-improvement*?

THE RIVAL.

"So, marriage seems in fashion!" said Basil Eustace, throwing the newspaper on the breakfast-table with an air of contempt.

"A good example for us bachelors," said his friend William Norton, "and one I really think I shall follow ere long, if I can find some kind-hearted girl who will accept me. How feel you, Basil?"

"My dear fellow, don't ask me," said Basil. "I trust there is no symptom of approaching insanity in my manner, and that alone could justify the question. Heavens! to become a husband—perhaps a father! To see eternally the same woman, and be called 'Papa, papa!' by an interesting miniature specimen of humanity in short clothes! Oh! the idea, the mere idea, is dreadful!"

Here Basil Eustace cast his eyes towards a large mirror, so placed that he might behold himself reflected at full length. The excitement had certainly made him a degree paler.

"Well, Eustace, this is too bad!" exclaimed Norton, laughing. "So, because you affect a horror of matrimony, all who have more courage than yourself are to be considered mad. You 'a good match' too! as the conventional slang goes."

"Oh, then, you designate me 'a good match?'" said Eustace: "Prove your words, William;" and leaning back in his luxurious chair, he dangled a slipper from the extreme point of his right foot.

"Thus it stands," replied Norton:—"You are the eldest son of a baronet, have five thousand a-year, and are a member of Almack's. You are young, not ill-looking, not ignorant, and have talents, if you were not too indolent to exercise them."

"You flatter me," said Eustace, smiling languidly. "But, my good friend, if I possess all these advantages, why give up all the consideration they bring by marriage? Who would care for me then? Depend upon it, the most foolish thing a young man of any pretension can do is to take a wife. If he must commit the folly, let him wait till he has had his day. Forty or fifty is the proper age for a husband!"

"Very philosophical, and very selfish!" exclaimed Norton. "Then, if ever you become that strange animal called a husband, it will not be until you are 'forty or fifty!' Mind you are not entangled before—that's all! The fair Helen will hardly wait so many years, I am afraid."

"Nonsense, Norton!" said Eustace, looking a little confused, however. "What should make you think of *her*? We have known each other from childhood, and I am sure she only considers me as a brother. We call each other Basil and Helen; and that is too familiar by far."

"Well," said Norton, "take care no disinterested friend of the family asks you suddenly some fine morning 'what your intentions are.' If you were called upon at once to decide, you would find, perhaps, that you could not give her up very easily. But adieu! I must go home and write letters, and will leave you to meditate on my words and Helen Dalton."

Norton departed, and left Basil Eustace indeed meditating deeply. His tirade against matrimony had been more in jest than earnest; and he began to imagine how he should feel if he had seen the marriage of Helen Dalton announced in the newspaper that morning. He discovered plainly that he should not have felt at all placid. To say the truth, though he had talked to Norton about Ellen's considering him only as a brother, he had long entertained a suspicion that he did not look on her only as a sister; and at the present moment this suspicion became stronger than ever. He remembered how disturbed he had been more than once when some handsome young fellow had whispered compliments in her ear, and how indignant he had felt to see her smile instead of frown. "I hope to Heaven," said Basil Eustace, with a sigh; "I hope to Heaven I am not in love!"

A servant entered with a card, which he presented. It was Mr Dalton's, and on the back was written in pencil—"Mr Dalton requests the pleasure of Mr Eustace's company to a quiet dinner at seven."

Basil wrote a brief reply, accepting the invitation, and the servant left the room.

"I shall see her, then, in a few hours," said Basil. "It is strange what an impression those few careless words of Norton have made upon me. Yesterday I should have met Ellen with perfect self-possession; to-day I feel that I shall not do so. Why is this? Can it be possible that I am in love?"

He sighed again more heavily than before, and raising his eyes from the ground, was shocked to discover, by the intelligence of the mirror, how pallid he looked. His hair, too, was in great disorder, and seemed to solicit the friendly aid of a comb. He would not have had Ellen see him then for the world.

Precisely at seven, the cab of Basil Eustace stopped at the door of Mr Dalton.

"Basil," said that gentleman, shaking hands heartily with our hero as he entered the room, "I am delighted to see you. Let me introduce you to some old friends of mine: Mr Thomson, who has just returned from the West Indies, and Mr Dawkins, and Mr Hawkins, and Miss Arabella Jenkins"——

Basil Eustace bowed coldly, and sinking into a chair, amused himself by pulling the ear of a favourite dog. In a few minutes afterwards Ellen appeared. She certainly looked most beautiful. There was some embarrassment in the manner of Basil as he offered his greeting, and it seemed to him that she slightly blushed. But why should she blush on this particular occasion? Perhaps he was more observant than usual.

At dinner he found himself, somehow, seated by her side; and the conversation was so interesting that it was impossible to help resuming it as soon as the gentlemen joined the ladies in the drawing-room. A quiet sheltered corner was the spot chosen, and the subject of the conversation was—marriage.

"Ah! my dear friend," said Basil, with a sentimental air, "beauty and happiness are not always found together. For instance, there is the charming Lucy Melcombe; 'tis whispered that she is fully aware of the merits of another, whilst her father wishes her to marry that monster Simmons. Really it is dreadful—perfectly dreadful! for there is the favoured one totally and wilfully ignorant of what is evident to all but himself; and, in the meantime, the poor girl may be sacrificed to his blindness. So that you see, Ellen," continued Basil, "a lady may be actually in love with a gentleman, and he not at all aware of it."

These words were uttered in our hero's usual *nonchalant* manner, but they seemed to produce a strange effect on the fair Ellen. She became first flushed, then pale, as she turned away her head, and exclaimed, falteringly—"Too true, indeed! Poor Lucy! But come," said she, resuming her composure by an effort, "the company, I see, is adjourning to the dancing-room. Shall we follow?"

Basil hesitated. He felt that he could have remained for ever as he was; he felt a wish to avoid the company below; and, in short, he felt, for the first time, aware that he loved Ellen. Her evident emotion at his last words had filled him with delight, and he ventured to indulge the sweet hope that he was not indifferent to her. Had he, indeed, been describing his own folly in the person of another? and might not the same punishment await further delay?

"Stay, Ellen," said he, detaining her; "now that we are alone, I wish to speak to you on a subject which I feel is essential to my happiness."

"Oh," said she, struggling to appear unconcerned, "you solicit my hand in the first quadrille? Well, your prayer is granted. But let us join our friends immediately, or I fear we shall lose our place."

"No, dearest Ellen!" exclaimed Basil, "my prayer is bolder—far bolder. I can no longer conceal from myself, nor from you, how deeply I love you."

Ellen did not speak; but she suffered him to retain her hand, and her silence was more eloquent than speech could possibly have been. In a few moments, however, she turned her face towards him, and said firmly—"Basil, I will not answer only by blushes and half-finished sentences, as most of my sex perhaps would do, but I will speak to you calmly and sincerely. I am aware, then, that I have a favoured rival, to whom less attention must be paid before you can hope for any return of the affection you profess for me."

"A rival!" exclaimed Basil; "let me assure you"—

"Nay," interrupted Ellen, smiling, "I know all. Do not think to deceive me. Listen: there is one who, under the guise of a friend, continually lures you to the homage you now disavow. Have I your permission to remove this false friend from about you?"

"To do anything," said Basil. "But what means this mystery? Believe me"——

"Enough," said Ellen; "I accept your permission, and promise you I will act upon it."

With these words, and a look full of meaning, she tripped away, leaving Basil in a state of the most unaffected astonishment. Too thoughtful to rejoin the company, he quitted the house and proceeded home.

He slept none at all that night, and morning found him still bewildered in a labyrinth of thought. A rival! What could she mean? "One who, under the guise of a friend, continually lures you to the homage you now disavow." It was a perfect enigma. "There is but one way," said Basil: "I will seek an interview with Ellen at once, and request—demand an explanation from her own lips." He descended to the breakfast-room. "But stay," said he—"a feverish, sleepless night!—I must look wretchedly hag-

* London: W. S. Orr and Co., Paternoster Row. 1842.

gard." Advancing to the mirror, he suddenly started back: it was shivered to atoms. He was about to ring the bell violently, when his eye was attracted by a sealed paper lying amongst the fragments. He seized it, broke the seal, and read as follows:—

"I have kept my word, and your false friend is no more. Do not be angry, for the murderess is ELLEN."

The paper fell from his hands. "Sweet Ellen!" he exclaimed, "I thank you for the deed. Too well I understand now who was your rival. The enigma is solved, and I see how poor a part I have played. I have trifled with your feelings like a vain fool; but my future conduct shall make amends."

And it did. He was more affectionate and unselfish as a husband than he had been as a lover. His friends were astonished at the great change in his character; and a little change in his habits struck them too—in the whole house, from the garret to the kitchen, not a full-length mirror was to be seen.

MORAL.—A man who is so far enamoured of himself as to neglect all others, is very apt to be left by others with the single object of his regard.

PEDESTRIAN EXCURSION IN SWITZERLAND.

UNTERSEEN—LAUTERBRUNNEN—ASCENT OF THE WENGERN ALP.

AUGUST 20.—To-day we resolved to make a detour to Berne, whither we had directed our friends at home to write to us; so, after sailing along the lakes of Brientz and Thun, we hired a vehicle, which brought us back to the lakes next morning. This tour having been elsewhere described, I take up the thread of the narrative from our return to the lakes.

August 21.—We were not able to leave Unterseen till between one and two o'clock, and thus our day was somewhat abbreviated. Our destination was, in the first place, the Bernese Oberland or Highlands—that wondrous assemblage of precipices, torrents, and glaciers, of whose savage glories we had hitherto had but distant and tempting glimpses. Our first point was the valley of Lauterbrunnen, running nearly due south of Unterseen. For some miles, as we walked towards the giant portals of the "palaces of nature," we were among flat verdant pastures, so rich and precious-looking, that we felt it a duty to be careful not to diverge from the pathway, lest we should injure the crop. Coming, however, to two small villages at the extremity of the alluvial land, the scene changed suddenly. The path ascended quickly into a narrow gorge, where rocks rose on either side, covered in all accessible places with pines, through whose dark foliage we could see the white flashing of a fierce stream, the roar of which at the same time came full and deafening on the ear. This torrent was the Lutschine, and it was with no slight eagerness that I scrambled to its brink, for I knew it to be one of those great glacier streams, which, coming forth furious from their icy halls, roll down into the great European rivers, unmatched for the rapidity of their mighty currents. My expectations were not disappointed when I had a full view of the broad white stream, and looked along it far into the recesses of the gorge from which it issued. I have seen the Highland streams in their most excited moments—for instance, in the great floods of 1829—but never had I seen in them anything to compare with the ruthless impetuosity of these glacier torrents. When the Dee has been in a "spate," as it is termed, I have sometimes found amusement in floating down the stream, and trying how fast it could carry me. At some spots where there are rocks or eddies, this might be a dangerous amusement; but what strikes one at once in the character of these Swiss streams is, that nowhere do you see any portion where, if you were tumbling in, it were possible for you to escape with life. The quantity of mineral substances held in solution in these streams makes them thick and muddy; and, on the whole, they have much more of the terrific about them than the beautiful.

The valley did not, like many others we had seen, expand when the narrow portals were passed. It grew narrower and narrower as we went on, and the rocks became more precipitous. Near the entrance the pines were very abundant, but, farther on, the bare rock shot up straight and perpendicular, for a height, we supposed, of about 2000 feet. On the face of these precipices we observed a remarkable instance of disturbance in the strata, which were folded over and over like a table-cloth. The valley is divided into two branches, of which that diverging to the right, and leading to Lauterbrunnen, was our route. These valleys are severed from each other by a like series of precipices with that which bounds either side of the united glen. A little after the separation, there presented itself right before us a mass of rock towering overhead, and literally beyond the perpendicular, for the more friable stone below appeared to have decreased through decay, while above, the mass projected itself forward like a great circular wall plum to the top. It was opposite to this rock that, turning a bend of the ravine, we beheld an object that showed how nature could cast even these mighty bulwarks into insignificance by rearing still grander works above them; for over these rocks, which were so near us and so high, we saw, towards the south, the distant Jungfrau, calm and serene, spreading forth her wide bosom of eternal snows—a fitting empress to hold sway over that wild domain of mountain and precipice.

It had become known to us, that as on this journey we should see physical nature in its noblest form, we should, on the other hand, see moral nature in one of its most degraded aspects. It is the sad fate of spots frequented by tourists, that the chances of gain from scattered profusion supersede the desire to live by honest industry. We are severe on foreigners for their readiness to bow before our mammon—their profuse willingness to barter their natural birthright of independence; but I suspect we overlook the extent to which the canker has spread in our own country. In some districts of the Highlands, the tourists have ingrafted the vices without the virtues of civilisation on the original wild nature of the population, and have produced a sort of mixture of the lacquey and the sorner. The other day, at Arthur's Seat, I was surrounded by children clamorous for the honour of giving me a glass of water from St Anthony's Well. It must be admitted, however, that the precursor of this degradation at home is generally extreme poverty. In the Oberland it is otherwise: genteel begging is a profession, and those who practise it evidently thrive by it. And here let us remark how heavy is the responsibility of those who, by a careless and childish liberality, foster this spirit, and hand over a people to degradation. Among the class of persons who travel in Switzerland, a few *batzen* thrown every now and then from the carriage window is a paltry sacrifice, and more than repaid by the vanity of superior affluence and the profuse gratitude of the recipients. It is in a restraint from such gratifications that a really generous feeling for the people is shown; and we think every man who sees the degradation produced by this species of mendicancy, should inculcate, among tourists, the doctrine of restraint with all his influence. There were several children with baskets of fruit, who were a little clamorous and urgent, to be sure, but whose proceedings were nevertheless all in the way of business and perfectly fair; they proclaimed their prices, and showed an enterprising spirit of competition. These, however, were the denizens of the flat and fruitful banks of Thun. As we went farther up the ravine, a different class appealed to us, who had no just claim to the merits of reciprocity. The best return they had to offer consisted in worthless fragments of quartz, bunches of flowers, or cholera-looking wild-berries. I have known instances where people have treated these efforts as a manifestation of the natural romance and fine feeling of the country, looking upon the

> "Peasant girls with deep blue eyes,
> And hands that offer early flowers,"

as a set of pure beings whose noddles have never been peopled by mercenary notions, and to whom it would be profanity to offer any vulgar dross of coin, whether silver or copper. I know not if there has been much real sincerity in this view of the matter, but, at all events, the artless peasants are now "up to" the trick; and whether you receive their present or not, they show, both by word and gesture, an enthusiastic desire to possess some pecuniary token of your good will. Many of these mendicants do not even offer the semblance of value, but hold out their hands in your face with a sturdy expression of greed in their eyes, and as resolute a manner as if they had been authorised, by an arrêt of the diet, to collect taxes from all travellers in that region. As we approached the village of Lauterbrunnen, several girls, about twelve years old, kept running alongside of us, apparently every now and then making an effort to range themselves in line along the road; but it appeared that we walked too fast to let them accomplish the manœuvre. What particular design they had upon us was a complete mystery; we only felt assured on one point—that the quarter against which it must be aimed was the purse. At last, a portion of these nymphs, by a dexterous forced march across a mound which we had to pass round, fairly flanked us, and were enabled to open their attack. They did so by opening their mouths, and uttering a series of harsh, grating sounds; and this was, it seems, the far-famed *Ranz des vaches*, or the local version of it. I know not whether it was that the songstresses had been simultaneously seized with sore throat, or that the rate we compelled them to proceed at was unfavourable to their vocal powers; but this I can attest, that any sounds more harsh I never heard from mortal lips. Well might Wordsworth say—

> "I listen, but no faculty of mine
> Avails those modulations to detect,
> Which, heard in foreign lands, the Swiss affect
> With tenderest passion."

I have the satisfaction to say that they got nothing by their movement, except a scolding, which we saw administered to them by the less agile fellow-choristers on whom they had attempted to steal a march.

But to return to more pleasing matters. Long we strained our eyes to see the great ornament of this narrow glen—the *staubbach*, or fall of dust; and at length we traced its graceful thread-like outline, dividing the face of one of the perpendicular precipices on our right. There is an appearance of something like a design to appropriate this fall, for the path to it leads through the inn. There is no inconsiderable sagacity in such an arrangement; for when you have to pass through a man's house to see any object, you cannot help feeling under something like an obligation to him, and the creation of such a feeling among tourists is mighty advantageous to an innkeeper. The chief sentiment, however, experienced in approaching this fall, is the impression of its surpassing beauty. When still far from it, you gaze up at the ledge from which the water leaps, with the eyes at a wide angle to the earth, for the cataract is said to be 900 feet high, nearly the sixth part of a mile. It receives its name from the circumstance that, owing to the great height, the small supply of water is dispersed into something like the semblance of dust before it reaches the earth; but whether because recent rain had swelled the stream, or because I took a different view of the subject, it did not appear that the description was quite applicable. The descending water had an appearance of continuity from top to bottom, but its volume was thin and transparent, allowing the rocks behind to be dimly seen through it as if they were covered by light lace. Prodigious is the quantity of spray dispersed around, and green and beautiful are the grassy mounds it refreshes. The staubbach is not a sight of which one would easily tire; yet we left its ethereal presence at last, feeling that though dust-falls may be very beautiful, inns, too, have their attractions.

As the sun had already ceased to penetrate into the deep and narrow valley of Lauterbrunnen, and we wished to sleep at a small inn we had heard of on the Wengern alp, we resolved, with some regret, so far to resign our freedom of motion as to put ourselves into the hands of a guide, sagaciously judging that we would not easily discover, in the dark, a house to which there was no road, perched somewhere or other on a mountain 6000 feet above the sea level. The person to whom we were committed was a most respectable-looking body, short and dumpy, with a quiet and rather shrewd sandy-coloured face. He had no sort of mountaineer or wilderness humbug about him, being attired in a felt hat and a rough grey cloth coat of a broadish cut, with trousers to match. He had much the appearance of a small muirland farmer; and if he had been met, precisely as he joined us, on the banks of Ettrick or Yarrow, instead of the Lutschine, nobody would have turned to look at him. He was sober, civil, and unobtrusive; perhaps the more so as he spoke only German, of which our stock was more select than extensive. He seemed to have but one ruling motive, which was the desire to relieve us, as far as he possibly could, of the burden of our five-franc pieces, in order that as many as possible of them might be transferred to his own pocket. Though he had the appearance of being a tough sturdy creature, he either was not physically strong, or he had been hard worked on some late occasion, for, as he went along, he exhibited frequent symptoms of fatigue; sometimes hung behind, was always ready to sit down, and frequently wiped the perspiration from his brow.

In truth, we had a pretty tough climb of it up that steep and endless bank; but it would be hard to say what labour would be too great to be rewarded by the gorgeous scene that presented itself, when we reached a sort of landing-place, from which we could look from the precipices that had frowned over us eastward when we were threading the glen. The first and noblest object of the scene was the Jungfrau with all her snows—not coldly white, as we had seen her from below, but bathed in a glowing hue of pink cast over her by the setting sun, whose rays then gazed upon her alone, and provided the landscape only with the light reflected from her ample snows. Right before us were the precipices on the western side of the glen, their brows collecting a soft twilight hue from the neighbouring snows and the reflection of the sky, but the gloom darkening on their faces as the eye scanned the surface downwards, and at length reached the deep night in which the bottom of the valley was reposing. Into this wide abyss, where the eye could find nothing but darkness, the lovely staubbach was seen falling. The top of the fall was clear, as if the evening sun shone upon it; but it darkened as it went down, and at last its slender thread was lost in the gloom. As if to increase the fairy-looking effect of this scene, a collection of eccentric rocks, cropping from the top of the opposite precipices, ranged themselves into the exact form of a feudal castle. It was not a mere shadowy outline—every thing seemed to be complete—barbicaned wall, screen, and battlemented tower; if it had not been ten times larger than any edifice human hands ever reared, we must have supposed it a veritable castle; and our guide seeing how intently we gazed on it, thought it right to favour us with the information that it was not a real *schloss*.

The path, which had been hitherto very abrupt, still tending eastward, brought us now through some fields of fine grass, on a bend of the mountain. There are at this point many *chalets* scattered about, and we saw their junior inmates carrying various wooden vessels on their way to and from the milking of the goats. A drink of goat's milk being decided upon by our party as a wholesome and agreeable beverage, means were immediately taken to procure a supply. These means were quite different from what we would have had to pursue at home. Instead of intimating, in the form of bargain and sale, our desire to be the purchasers of a certain quantity of the commodity—a measure that would have involved a needless train of unavailing efforts, in the most difficult of languages—we contented ourselves with laying a hand on one of the wooden vessels in question, and appropriating its contents. Now, had we attempted any such operation in our own independent land, the most stolid urchin would have uttered some indignant exclamations, or made appeal to the vengeance of some father, mother, or "big brother." Here it was quite otherwise. The

youth took a commercial view of the transaction. His discrimination taught him at a glance that we were "good" for so many batzen, and he watched our proceedings with a smiling and satisfied face. After all, it is on the continent only that British liberty can be enjoyed to perfection. At home, every man's freedom of action is counteracted to a certain extent by that of his neighbour's; but in the tourist-frequented parts of the continent, you may do precisely whatever you please, provided you are ready to pay for it. As we proceeded on our way, one of these bucolical urchins threw down his pail with such inconsiderate haste as to upset it, and ran off on some very evident design for his own benefit. He appeared presently with an alpine horn—a sort of wooden trumpet about his own size—and placing himself before a petty perpendicular cliff, remarkable, I suppose, for its echo, blew a loud, full, thrilling blast, which was re-echoed over and over, as if it had scattered itself in fragments of sound among all the surrounding mountains. This was a nice case of pecuniary ethics. We had resolved to give no encouragement to the begging propensities of the district; but we had wished to hear the alpine horn, and we *had* heard it, and it had been sounded for our special ears by a skilful performer, so we thought we were bound in justice to pay for it, and did so.

The night deepened apace as we left the chalets behind us. Indeed, so dark did it become at last, that it was with difficulty that we could see each other when three or four feet apart; and we followed the footsteps of our guide in a string, cautiously and silently, like Indians on a trail. There was no path, and we felt that our way was for some time beneath the shade of trees; but even when it was evident that we had mounted beyond the forest belt, and were treading the bare hill, the darkness was equally profound; no stars could be seen. There was no wind, but a sort of stifling dankness in the air, and it was evident that we might safely characterise ourselves as "under a cloud." In the midst of this silence and darkness, there came upon our ears a loud prolonged roar, like the continued discharge of artillery. It did not require the guide's information to let us know, while we stopped and held our breath, that an avalanche was falling—an occurrence which sometimes takes place by night, but not so frequently as by day. It sounded most startlingly near, yet we knew there was a wide valley between us and the Jungfrau, from whose snowy sides it must have descended. On we went, climbing higher and higher, the cold bracing our limbs for exertion. At last the guide suddenly stopped, a door was opened as if it had been the removal of a portion of the mist from before us, a bright light shone forth, and we found ourselves in the passage of a not uncomfortable-looking tavern. There we partook of a plentiful supper, the chief ingredient of which was chamois steaks; and we remarked that we had never seen a better-filled board than was presented to us by the Inn of the Jungfrau, as this establishment calls itself.

FAVOURITE PHRASES OF THE PRESS.

It must have been remarked by many that, in newspaper and other popular writing, certain terms and phrases are every now and then coming into use, which every body for a while employs on all possible occasions, until, becoming rather stale, they are left to the very weak and small writers alone, or go altogether out of fashion. Generally, these words are first used on some remarkable occasion, and by a remarkable man. Running a complete round of all the world's newspapers, they come at once into every body's mouth, and pass into universal currency; and it is only when mankind at large get thoroughly disgusted with them, that they are allowed to drop.

In our young days, one of the most current of these words was *refreshing*. All sorts of things, from an unaffectedly written book to a glass of ginger beer, were refreshing. Every body was fain to affect a sort of exhaustion and fatigue from the absurdities and follies of the world, in order to have an opportunity of saying of something that it was "refreshing." This universal mania for things refreshing was the consequence of nothing more or less than the employment of the word in a striking and epigrammatic manner in one of the articles of the "Edinburgh Review." The eagerness for things refreshing has of late years experienced a marked decline. The simple fact is, that the word has been worn threadbare.

For some years past there has been a great run upon the word *category*. The logical world has had categories since the days of Archytas of Tarentum. Pythagoras caught them up there, and passed them to Plato. From Aristotle to Kant, all philosophers have laid stress upon the categories. But the public never heard much of the word till La Fayette, one day soon after the last French Revolution, spoke of one part of Europe being under the category of despotism and another under the category of liberalism. The term took at once, and since then every gentleman of the press classifies every thing under categories. Logicians before that period attached a particular meaning to the word, which is not by any means strictly attended to by gentlemen of the press; but that is of little consequence, of course, according to the modern code, if only the word be understood as it is meant. However, we rather think category has become a little worn out, and is beginning to be not nearly so much in request as it once was.

The time at which category arose, gave birth to a few other phrases that have been a good deal hacked about. To *use all constitutional means*, was justly thought to be a most important principle in policy. The word *people* gave place to *the masses*, and the procedure connected with any measure was held as a *movement*. Proposals for general butchery, which our ancestors would have spoken of in some candid but disagreeable manner, were elegantly adumbrated under the term *physical force*. When moderate people did any thing, the fervid spoke of them as *enacting the farce* of so and so; and when something suspiciously plausible was brought forward, the only remark made about it was "*Bah!*" Any thing uncommon or startling was sure to frighten somebody *from his propriety*. Even in the most simple domestic matters, any one happening to be taken somewhat by surprise, invariably *looked unutterable things*. There have always been nobility and gentry in England; but it was only now that any one discovered that there was an *aristocracy*. The most unpretending specimen of a gentleman living on a competency in a country town, now became one of the aristocracy. It was at an earlier time that the word *population* came into vogue, probably in consequence of Mr Malthus's doctrines. Goldsmith, speaking of the intrusion of a mad dog into a village, would have said—"The inhabitants rose to give it chase;" but a modern newspaper, chronicling such an event, would say—"The population rose to a man." Population, we believe, does not strictly apply to persons; but no matter. Let the word, like the dog, have its day. Besides, we always observe that, when grammarians begin to persecute a word, it is sure to be just the more persisted in. The best way to get the British "population" out of any such heresy is to let them flounder in it till they are wearied, when they will be pretty sure to get out of it themselves.

One of the favourite phrases of the press will be, we hope, generally acknowledged to be entitled to more than usual respect—the *law of the land*. Laws were long ago laws, and the law was the law; but when the Reform Bill was passed, it was owned, by a conservative on a particular hustings, to be the law of the land, and as such entitled to fair play; and the law of the land has ever since been a reigning phrase.

A few years ago, when any paragraph appeared in one newspaper which seemed excessively absurd to another, it was customary to quote it with the addition of *Fudge*. This did very well for a while, but, unluckily, a libellous paragraph being quoted with this addition, both the paper which originated it and that which quoted it with the addition, were cast in damages, the judge affecting not to know what fudge meant, though all the world did. This was a cruel commentary on a jest, and the word has since been modestly withdrawn from circulation.

Clique, and *length and breadth of the land*, are also phrases of the last ten years. Any quiet little set of gentlemen who take upon themselves the trouble of managing some piece of public business which nobody else will attend to, is now a *clique*, and, being a clique, they must necessarily be very bad. *Length and breadth of the land* is a good demagogue phrase. It comes finely off the tongue, and tells well on a crowd. Tell any large assemblage that such and such a cause is pervading the country, it will have no effect at all; but say to them that it has gone or is going over the length and breadth of the land, and the sensation on the extreme left and extreme right, the centre, and all over the house, becomes tremendous.

There are also a few learned phrases which gentlemen of the press, and particularly newspaper editors, were in the habit of sporting on all occasions, by way of showing their intimate acquaintance with the classics, but which have now become dreadfully threadbare. Suppose a statesman, in an opposite line of politics, had promised to carry through a measure of importance, the newspaper writer, not many years ago, would probably express himself thus in relation to the matter:—"The subject has been propounded with as much *sang froid* as if the intentions of the hon. gentleman were perfectly *bona fide*. Why, every one at all conversant with the gentleman's history is well aware that the *measure in question* will pass about the period of the *Græcæ Kalendæ*. *Experto crede!*—we well know the motives of the hon. gentleman. His political character has hitherto presented one of the blackest pieces of tergiversation and blackguardism (these expressions must be understood in a *parliamentary sense*) to be found in the whole range of our political history. *Eheu! credat Judæus!* Let no man be deceived by the pretences of the right hon. gentleman. *Verb. sap.*" The threatenings of power, in newspaper language, used to be *a mere brutem fulmen*; a popular orator was *vox et præterea nihil*; and a legislative measure not advancing was *in statu quo*. It may be noticed, too, that statesmen invariably "kept the word of promise to the ear," and were as regularly advised to "assume a virtue if they had it not." A drinking bout in honour of some civic dignitary was elegantly styled "The feast of reason and the flow of soul;"—at which feast the honoured party expressed himself in a manner "which did equal credit to his head and heart," and, in allusion to the "novel and affecting" nature of his situation, actually shed tears, "albeit unused to the melting mood." The public, however, seem heartily sick of all this affectation; at all events, the phrases noticed have been repeated *usque ad nauseam*, and may as well sleep henceforth in "the tomb of all the Capulets."

After this exposé of the favourite phrases of the press in our *widely circulated journal*, will any writer within these realms ever use any of them again? *We pause for a reply.*

A SCOTTISH TUTOR'S FIRST SITUATION.

There is much humour, and something of a more important quality, historical value, in an account of his first situation, given by a Scottish Tutor in a series of papers in Constable's long deceased "Edinburgh Magazine." The author, now a professor in one of the northern universities, began his career about fifty years ago, as teacher of the children of a comfortable Dumfriesshire farmer of the old class; and his description of that person's household and family strikes us as at once highly amusing, and a curious record of a style of things now quite passed away. It was about his sixteenth year that his widowed mother agreed with the honest farmer that her son should establish himself as tutor in his house during the six or seven weeks' recess of the school at which he was proceeding with his own education. The remuneration agreed upon was of a nature which might have seemed proper in the eyes of a Spartan—four fleeces of wool, to be spun into clothes for the young scholar, a ewe-milk cheese, half a stone of butter, three white shillings, and the use of the grey nag to the Martinmas market at Dumfries. Writing twenty years ago, the author thus proceeds:—

"I felt, as I ascended the brae towards the place of my autumn destination, that I was about to enter upon an untried state of existence; and my agitation as, first, the blue and writhing smoke, and, latterly, the spiked and lacerated kitchen-lum head, with the roofing of the whole onstead, rose gradually upon my vision, was very considerable. At this moment the butter, the cheese, the wool, and even the grey nag himself, appeared as nothing in comparison with the sacrifice of comfort and domestic happiness I was on the point of making. I absolutely sat down upon a grey stone, turned my eyes towards my native glen, and, whilst I could contemplate many well-known and familiar objects in the immediate neighbourhood of my beloved home, I thought of the kindly hearts I had left, and could have wished myself a cat, or a dog, or a chicken, provided I could have thus enjoyed the privilege which these animals were now enjoying. To have been fixed, at this moment, as the disobedient wife of the patriarch Lot was fixed, would not, in my present state of despondency, have vexed me; and I deliberated for a considerable time whether I should advance upon my new residence and office, or retreat at once, and give up all ideas of harvest service and gain.

Whilst I sat in this state of suspense, casting many a longing lingering look towards my native Jerusalem, the land of my household gods, the sweet abode of my heart's earlier and later, habitual, sole content, I was saluted by the barking of a colley-dog, who retreated, as if with suspicion (like a courtier, however, still facing me), from my august and gloomy presence, and retired upon the plaided protection of his master. In a word, I now found myself in the presence and under the guidance of 'the gudeman himsel',' who, having taken a turn to the hill to survey the sheep, had seen me on my way, and having discovered my advance, had shaped his descent from the height accordingly. 'Come awa', lad,' said the kindly and honest-hearted farmer in a most encouraging tone; 'kail time's ay lucky time; come awa' hame, and we'll see what the gudewife has got for hungry stomachs. Ye'll be e'en a wee yauppish* after your lang journey; and the weans, puir things, are a' out on the Fyet Know-head, glowring out their een for ye.' This address, very luckily, left me no time for hesitation; so onwards I went, keeping, if not pace, at least parallel with my conductor's strides; and after encountering a strange bevy of children, and dogs, and boggling cattle, I arrived in safety, through dub and mire, at the side of the kitchen fire. I was seated beside the gudeman upon the lang-settle; and whilst dinner was getting forward, I had begun to contemplate my new situation.

Immediately before me there blazed a large peat fire upon a millstone hearth, which, sloping off on all sides,

* Hungry, appetised.

caused every burning clod which tumbled down to drift to a considerable distance. Over this fire was suspended a large potful of newly 'seiped' potatoes, sprinkled over thickly with salt, and sending up, from their cracking and steaming skins, a misty flavour. Beside the fire stood a kail pot, still bubbling and chuckling over—somewhat more inviting contents; and the cubbard, or dresser, gave support to a smoking pail or cogful of crap whey. Above the hearth sat the household gods, in the shape of two barefooted boys—my future pupils, apparently about eleven or twelve years old, scratching their heads manfully from time to time, and looking at the master as if they had been surveying the lion in the Tower. Over their heads, and that of a newly arrived servant lass, who was evidently set in for dinner, hung a drapery, partly composed of old stockings, hoshens, children's clothes, and newly suspended sheep-skins turned inside out, and still indicating, by a few drops of blood on the sooty and dusty bench, that they had not been many hours separated from the carcass they originally covered. The gudewife, with a young child in her arms, or rather hanging leech-ways at her breast, and carefully turned over towards the fire, sat on the opposite side, amidst a whole bevy of younglings who had just escaped, as their hands, faces, and clothes, and whole appearance indicated, from contending with the pigs, or following at every risk the ducks through all the depths and green defilements of the byre-door dub or floshen. Towards the outer-door, and in the rear of all this, were to be seen wet plaids suspended over the corners of beds, and a marshalled supply of kents or staffs, which showed their hooked and variously ornamented heads from above beds and presses, where they had been lodged 'out of the bairns's way.' There was no ceiling, or ornamental frieze; but the absence of this was supplied by a canopy of dense blue smoke, through which, at intervals, the rannel tree and rafters gleamed in all the indistinct decoration of sooty japanned work. Men and women poured in and in, and, without any salutation or ceremony, took their seats or stations precisely where they could find them; and in a few minutes after my arrival, the kitchen exhibited the appearance of a crowded 'kill-oggie'* at halloween. Here, in fact, every thing wore the aspect of liberty and happiness. The cricket chirruped behind the furnace fire with a peculiar note of freedom and comfort. The kittens played and romped it at large; whilst the more sedate mothers of the feline race were carefully navigating their way through and amongst the 'sporades,' immediately beneath and in front of the kitchen table. The servant lass, with her petticoat tucked up, chanted aloud whilst she rinsed the pots or arranged the dishes for dinner. The dogs and elder boys were upon the most intimate and familiar terms imaginable; and the whelps, or puppies, shared the buttering, if not the bread, with the younger children.

All the distinction which attached to the master of this primitive establishment consisted in the privilege of saying grace at meal-time, and of giving prayers at night and morning; whilst the gudewife was quite contented with such casual marks of command and authority as the scolding of the maids and the conducting of her kitchen economy implied. The gudeman, together with the greatest simplicity of manners, was exceedingly irascible, and not unfrequently burst out into paroxysms of rage which were not less striking than ridiculous; but so soon as the evil spirit had departed from Saul, which, in ordinary cases, took place in a very short time, the spring-tide of his natural benevolence returned in full and accumulated flow.

One day he chanced to discover a young horse in the midst of a corn field, and quietly employed in appropriating the grain to his use. Having made several efforts, but without success, to remedy the evil, and finding that in spite of all his and his dog's noisy and preposterous measures, the transgressor still advanced farther into the field, trailing the grain in mouthfuls, and breaking it sadly down, he flew into a paroxysm of passion, ran home as fast as his feet could carry him, and having armed himself with an old Queen-Anne gun, was upon the point, when arrested by the hand of a less mercurial menial, of 'laying a handful of slugs under the old jade's flanks,' as he expressed it. This servant received a pair of extra shoes against next Martinmas Wednesday for his prudent interference. On another occasion, one of his own children having suddenly excited his displeasure, he took up the offender and dashed him violently and headlong into the duck pond; but coming immediately, as was usual, to his better senses, he snatched the culprit from his comfortless rather than dangerous situation, and carrying the 'puir wean' in to his mother, absolutely shed tears over his own cruelty and rashness. Of this circumstance advantage was afterwards taken in procuring a suit of new clothes for the sufferer against the next Thornhill fair. There was not an occasion, in a word, on which the gudeman appeared in extraordinary power and authority, from which he did not retire vanquished and subdued.

The gudewife's character is more difficult to individualise, and yet, in my own imagination and recollection, she sits as separate and distinct as her husband. In one respect she was his perfect counterpart; for nothing on earth could put her into a passion, or make her lose that cool, equable, *most teasing* demeanour, which was natural to her One could never tell whether he had succeeded in giving her satisfaction or not; for if she were displeased, she said little, and looked still less; and if she were satisfied, her external indications of approbation were equally questionable. She moved slowly but steadily in the midst of her family, smoking her pipe, nursing her child, superintending the cheese-making, observing glaring negligences, and keeping the gudeman in mended stockings and night-caps.

The two boys, who, properly speaking, were my pupils, had attained to considerable address in leading cars, in watering horses, and in all that scientific tact which lazy servants know so well how to induce upon easily flattered and active children; but as to literary attainments, having never visited a school, or experienced until now the benefit of a teacher, they were glaringly deficient. Though advanced, nominally, into the Proverbs and the New Testament, and made acquainted, by the ear, with the Lord's Prayer, the Ten Commandments, and the 'Belief,' they were, in reality, still labouring with the perplexing similarities of the *b*'s and the *d*'s, the *p*'s and the *q*'s, and would rather have turned all the sheep upon the hill, or watered all the horses in the grass park, than have mastered the alphabet.

Soon after dinner, the two urchins were urged forward by the compulsory hands of their mother into my august presence; and upon putting a few simple questions to them in succession, I found that the one regularly looked into the face of the other for an answer. The fact was, that in spite of all my endeavours to suit and accommodate my queries to their opportunities and apprehension, I still found myself unsuccessful; till having observed the nether extremities of a humble or earth-bee hanging by the waistcoat-breast of the elder urchin, I made inquiry respecting the amount of 'binks,'* with the knowledge of which he was blessed, and found him deeply versed and correctly informed upon the subject. 'Sandy, there, kens o' three foggies and twa red bottoms; but I ken of a real blue *bummer*, as big as the tap o' yere thumb, man.' This conversation brought us completely into acquaintanceship, and even familiarity, and laid open the floodgates of Rab and Sandy's speech—an evil which all my future art and authority could never remedy.

Towards evening I was conducted into the 'mid-room,' an apartment which lay at an equal distance from the 'but' and from the 'ben;' where, being a stranger, I had tea administered to me by the gudewife herself. Here, surrounded by every kind of children's clothes, and immersed in the gudeman's whole wardrobe of wearing apparel, which lay heaped up upon two wooden chairs, we sat on the side or stock of an adjoining bed, and in immediate opposition to an old fusty *maiden*,† who flourished out her elbows and spread abroad her train in antique style from over the chimney-piece. And here the gudewife and I became so well acquainted and gracious, that long ere the tea was over, I had a squalling brat on each knee, and had been regularly apprised of the obligation under which such occasional accommodation to her convenience in this way would place her. Having never in my life been accustomed to children, I made but an indifferent and a somewhat awkward nurse; but the mother praised my address; and all, in so far, was well. At night, after supper, and at the very instant when the gudeman had given out the first line of the psalm, in the midst of a half-sleeping audience, I was kindly nodded away by the gudewife, and conducted 'ben' to my bed, of which both my precious pupils had previously taken possession, and where they were already lying 'heads and thraws,' with the blankets (for sheets there were none) tossed and roped about in the utmost derangement and confusion. Nor were these, my restless and unaccommodating pupils, the only company I had to contend with during the night; for the ben-house having been appropriated, with the exception of the corner where the bed stood, from time immemorial, to the reception of wool, there had collected and consociated, year after year, a vast variety and a countless amount of vermin, which, like the beasts of prey mentioned in the Psalmist, sallied out during the silence and repose of the night upon predatory excursions. Their motions and evolutions were so rapid, that, like a certain queen of a celebrated city, I could have wished to have had a train of artillery in my chamber, to attack and discomfit them. However, such is the happy constitution of youth and health, and a substantial potato supper, that, after a few fruitless endeavours to diminish the number of assailants by an offensive warfare, I wrapt myself up, as Horace has it, in 'my own integrity,' and positively fell into a sound sleep. When I awoke in the morning, the light had just begun to dawn over the damp and dreary solitude of my, or rather our chamber, and I could still hear the gudeman's powerful and highly pitched voice twining away at the psalms in the kitchen, where, on the preceding evening, I had left him. This circumstance at first occasioned me some surprise, as I had left him singing at night, and concluded that he had not yet ceased his devotional exercise; but upon further investigation, I found that I had slept longer than I had imagined, and that hence my misapprehension had originated.

Here, indeed, I was nominally the instructor of youth, and had the benefit of having myself addressed by young and old under the imposing title of 'the master;' but in fact my daily and habitual employment lay a hundred miles distant from all and every species of teaching. Whenever a push of domestic labour (which during harvest is an event unusually frequent) required the immediate agency of the kitchen-maid and of her assistant, in all humble subserviency, the mistress, I was immediately summoned into action. The cradle was to rock; the bairn 'to tent a wee,' and to keep out of the fire; the broth pot was to cool, and to prevent from o'er-boiling; and I was intrusted with all the weighty and inviting contents of a 'barrel-kirn.' The herd's cog of porridge were likewise to be borne a-field; and many a soft and misty morning have I seen him skin off the brat, and leave the 'clauted' loggings for the service of his dog, beneath the comfortless covering of a wet and spongy plaid. At dinner time, too, I found myself loaded with a stoupful of broth on my head—steady, boys, steady!—and a brace of milk cogs in either hand; and in this guise and capacity it behoved me to make my approach to the harvest 'boon.' For the gudeman, likewise, I was all hands, arms, and legs, converting myself, at his bidding, into a driver of cars, a tramper down of hay, or a turner of fanners. I could never be made acquainted, however, with the art of forking or of threshing corn, though I was occasionally compelled to make the essay.

All this was quite foreign to my former habits; and had it not been that I was gloriously fed, was, after all, kindly used, and looked forward to a rousing *kirn*,* and the grey nag to Dumfries market, I had certainly taken a moonlight leave of my present residence. Yet still I had moments and seasons of most melancholy reflection and longing desire, when I thought of home and all its comforts and early associations. They only who have been brought up amidst the sublimity and withdrawing of mountain scenery—whose affections have been early wedded to the few but permanent and kindly objects which a home thus situated presents—such only can appreciate the full force and depth of my present feelings, that sinking of the soul and despondency of spirit which obtains when 'home,' for the first time in particular, is no longer within immediate and every-day reach. Never did a descendant of Heber, whilst weeping by the brink, and suspending his harp upon the willow-tree of Babel's stream, long more ardently for Zion, city of the living God, than did the unfortunate subject of this history for the burn, the yard, and whole consecrated aspect and establishment of home.

The harvest at last drew towards a close, and 'the kirn,' the long anticipated feast of ingathering, arrived. On the day of the *winning*, as it is termed, of this agricultural conquest, the gudeman's boon amounted to upwards of fifty hooks, for there had been a general turnout from the adjoining villages and farm towns, to aid, gratis and voluntarily, in the accomplishment of this desirable event. Whole hecatombs had been boiled and roasted, and the barn smoked to the rigging, before seven o'clock at night, with every variety of viand in which peasant and hungry stomachs are known to delight. It is needless to particularise where every thing was deserving of commemoration, or to excite the longing of some unhappy reader by description, without being able to gratify it; suffice it to say, that neither haggis nor pudding, of every rank and authority, from the plebeian 'white hause,' up to the imperial 'gibby with the girds,' were absent, and that the herd callan' had like to have choked upon the first mouthful of stewed meat, in his unpropitious and unsanctified haste to secure a bellyful. What had begun in good eating ended in equally valorous drinking, and in all that demonstration of noisy merriment and gleesome delight which a blind fiddler could countenance from his four-stringed and otherwise deficient instrument.

When I returned home, at the end of this my first 'service,' and found myself again conversant with the poets and historians of antiquity, I felt as if, from a state of slavery, I had all at once ascended into freedom and honour; and for the dungeon's damp and confinement, was again permitted to breathe free and dry air, under a blue sky and an ample horizon. On all former occasions of harvest recess, I had returned to my winter tasks with a heavy and a peevish spirit, regretting the past, and averse to encounter the future; but at this time the idea of the school, and the master, and the class, and the emulation, and the honour, and the victory, came upon my newly-awakened faculties in one tide of oppressive delight. Besides, I had earned something which I could call my own, and had it in my power, for the first time in my life, to show some small degree of gratitude to the best and kindest of parents; and when I came over the knowe-head, and descended upon the blessed Goshen of my heart's affection; and when I met the smiles, and the kind inquiries, and the hearty congratulation of my aunts and mother, not to speak of Rover, there was not a happier soul in all King George's dominions."

POEMS OF MISS BLAMIRE.

Miss Blamire was a Cumberland lady, who lived in the latter part of the last century, and was known to have written a few small poetical pieces of merit; but her name had never appeared except in a few provincial miscellanies, and no volume of her verse had ever been published. At length, nearly fifty years after her death, two admirers of her writings have taken the trouble to collect as many of them as possible amongst her surviving friends and collateral relations, and these have been given to the world in a neat volume, with an appropriate biographical memoir and notes.† We learn from this source that Miss Blamire was of a good Cumberland family, born in 1747; that she received an ordinary education, and was distinguished by her frank and lively manners; and that, after an amiable and spotless life, she died unmarried in 1794. Her biographer thus describes her in her twentieth year:—"She had a graceful form, somewhat above the middle size, and a countenance—though slightly marked with the small-pox—beaming with good nature; her dark eyes sparkled with animation, and won every heart at the first introduction. She was called by her affectionate countrymen 'a bonny and varra lish young lass,' which may be interpreted as meaning a beautiful and very lively young girl. Her affability and total freedom from affectation put to flight that reserve which her presence was apt to create in the minds of her humbler associates; for they quickly perceived she really wished them happiness, and aided in promoting it by every effort in her power. She freely mingled in their social parties, called *merry neets* in Cumberland; and by her graceful figure, elegant dancing, and kind-hearted gaiety, gave a zest to the entertainments which without her presence would have been wanting. She has been described to me as enjoying herself greatly on these occasions; marking with a keen eye the various shades of character around

* Roasting of apples and burning nuts at a kill-oggie, on halloween, was a favourite amusement with our ancestors.

* Hives.

* Harvest-home.

† The Poetical Works of Miss Susanna Blamire, "the Muse of Cumberland." Now for the first time collected by Henry Lonsdale, M.D. With a Preface, Memoir, and Notes, by Patrick Maxwell. Edinburgh: Menzies. 1842. pp. 262.

her, and the whole proceedings, with intense interest. Before the hilarity of the evening had melted the restraint usual at the commencement of such parties, I have been told she would relish the bashful approaches of the young villager as, with much hesitation, he made his homely bow, and begged she would honour him with her presence at the dance; that she would start up with hearty good-will, spring round the room, and thus dispel those timid fears which at first somewhat marred the free expression of delight or the loud laugh of enjoyment. How much she was the cynosure of those parties, as afterwards she was equally so in those of a higher grade, may be gathered from the following anecdote, which was told me by the late Miss Thompson of Carlisle:—A worthy farmer, who almost worshipped the poetess, about two weeks after her death came to Miss Rowlands, a relation of Miss Blamire, for the sole purpose of having some conversation concerning Miss Sukey, as she was fondly and familiarly called by her neighbours and the people in the district, and for mutually bemoaning their loss. Miss Rowlands excused herself on the plea that the affliction was so recent she could not summon fortitude sufficient to converse on the subject, and intreated him to call on some future day. 'Well, well,' said the kind-hearted farmer as he was taking his departure, 'I could find neither rest nor comfort till I called on you to have some talk about her: the merry neets will not now be worth going to since she is no more!' So vividly does the memory of worth and of genius dwell on our minds, and so fondly do we regard their most trivial actions."

Miss Blamire had begun to write poetry in 1766, when she was only nineteen. In the ensuing year, her sister was married to Colonel Graham of Gartmore, and to that gentleman's beautiful residence in Lower Perthshire Susanna accompanied the pair. The few years which she spent in Scotland served to acquaint her with the manners, language, and popular poetry and music of our country, and made her, it may be said, almost as much a Scottish as an English poetess. How well she was able to simulate the simplicity and pathos of the Doric muse of Scotland is shown in her songs—"The Nabob," "The Siller Croun," &c. Her biographer says—"Whether Mr Graham of Gartmore, author of the song entitled, 'Oh tell me how to woo thee!' was the father of the colonel, or how they stood related to each other, I have not been able to ascertain." This is unfortunate, for the fact we believe to be, that Miss Blamire's brother-in-law was rather distinguished as an amateur verse maker, and it may of course be presumed that close domestic intercourse with such a person must have exercised a powerful influence in directing her mind to poetry. His song, above quoted, was so happy an imitation of the romantic style of a former day, as to impose upon Scott, who gave it a place in his "Minstrelsy of the Scottish Border." We have seen another composition of his, an address spoken in the Edinburgh Theatre in 1771 or 2, on a night devoted to the benefit of Smollett's widow. It appears that Miss Blamire's own relations discouraged her muse, and scarcely could appreciate the entertaining vivacity of her manners and conversation. Sad to relate, illness began to damp the fire of our Cumbrian Sappho when she had little passed her thirtieth year. There is considerable reason to suppose that this was connected in some way with a passion which she entertained for a gentleman of family somewhat superior to her own, whose relatives had interfered to prevent a union between them. Miss Blamire died at Carlisle in her forty-seventh year.

In this collective edition of her poetry, the lead is taken by a piece of considerable length, entitled, "Stocklewath, or the Cumbrian Village." It gives a description of the village and its inhabitants, in a manner which slightly reminds us of Crabbe's early poems, but is more gay and cheerful. The curse of rhetorical stiffness and formality, which blighted so much of the poetry of the last century, is also in part upon that of Miss Blamire, notwithstanding the natural tendency of her genius to break through such bonds. But this fortunately affects only one section of her compositions. In her songs, whether in pure English, or in the Cumbrian or Scottish dialect, she is animated, simple, and tender, often touching a chord which thrills a sympathetic string deep in the reader's bosom. It may, indeed, be confidently predicted of several of these lyrics, that they will live with the best productions of their age, and longer than many that were at first allowed to rank more highly. We must endeavour to justify our opinion by extracting specimens in the various modes of her lyre—and first, for an English song:—

WHEN THE SOFT TEAR STEALS SILENTLY.

When the soft tear steals silently down from the eye,
Take no note of its course, nor detect the slow sigh;
From some spring of shy sorrow its origin flows,
Some tender remembrance that weeps as it goes.

Ah! it is not to say what will bring to the mind
The sweet joys departed, the friends left behind;
A tune, or a song, or the time of the year,
Strikes the key of reflection, and moans in the ear.

Through the gay scenes of youth the remembrancer strays,
Till mem'ry steps back on old pleasures to gaze;
Fleeting shadows they seem that glide calmly away,
The remains of past hours, and the ghosts of a day.

When we set out in life every thing has its charms,
Enkindles the fancy, and all the heart warms;
'Tis this makes us look on the joys that are past
With an eye that turns coldly to glance on the last.

Let the tear, then, flow on, nor mark the full eye,
'Tis the soul's secret off'ring no mortal should spy;
Few hearts are prepared for a rite so divine,
When the feelings alone sacrifice at the shrine.

As an example of the Cumberland dialect, we select

AULD ROBIN FORBES.

And auld Robin Forbes hes gien tem a dance,
I pat on my speckets to see them aw prance;
I thout o' the days when I was but fifteen,
And skipp'd wi' the best upon Forbes's green.
Of aw things that is I think thout is meast queer,
It brings that that's by-past and sets it down here;
I see Willy as plain as I dui this bit leace,
When he tuik his cwoat lappet and deeghted his feace.

The lasses aw wonder'd what Willy cud see
In yen that was dark and hard featured leyke me;
And they wonder'd ay mair when they talk'd o' my wit,
And slily telt Willy that cudn't be it.
But Willy he laugh'd, and he meade me his weyfe,
And whea was mair happy thro' aw his lang leyfe?
It's e'en my great comfort, now Willy is geane,
That he offen said—nea pleace was leyke his awn heame!

I mind when I carried my wark to yon steyle,
Where Willy was deyken, the time to beguile,
He wad fling me a daisy to put i' my breast,
And I hammer'd my noddle to mek out a jest.
But merry or grave, Willy often wad tell
There was nin o' the leave that was leyke my awn sel;
And he spak what he thout, for I'd hardly a plack
When we married, and nobbet ae gown to my back.

When the clock had struck eight I expected him heame,
And wheyles went to meet him as far as Dumleane;
Of aw hours it telt *eight* was dearest to me,
But now when it streyke there's a tear i' my ee.
O Willy! dear Willy! it never can be
That age, time, or death, can divide thee and me!
For that spot on earth that's aye dearest to me,
Is the turf that has cover'd my Willie frae me!

Finally, a song in the Scottish manner—

THE NABOB.

When silent time, wi' lightly foot,
Had trod on thirty years,
I sought again my native land
Wi' many hopes and fears.
Wha kens gin the dear friends I left
May still continue mine?
Or gin I e'er again shall taste
The joys I left langsyne?

As I drew near my ancient pile,
My heart beat a' the way;
Ilk place I pass'd seem'd yet to speak
O' some dear former day;
Those days that follow'd me afar,
Those happy days o' mine,
Whilk made me think the present joys
A' naething to langsyne!

The ivied tower now met my eye,
Where minstrels used to blaw;
Nae friend stepp'd forth wi' open hand,
Nae weel-kenn'd face I saw;
Till Donald totter'd to the door,
Wham I left in his prime,
And grat to see the lad return
He bore about langsyne.

I ran to ilka dear friend's room,
As if to find them there,
I knew where ilk ane used to sit,
And hang o'er mony a chair;
Till soft remembrance threw a veil
Across these een o' mine,
I closed the door, and sobb'd aloud,
To think on auld langsyne!

Some pensy chiels, a new sprung race,
Wad next their welcome pay,
Wha shudder'd at my Gothic wa's,
And wish'd my groves away.
"Cut, cut," they cried, "those aged elms,
Lay low yon mournfu' pine."
Na! na! our fathers' names grow there,
Memorials o' langsyne.

To wean me frae these waefu' thoughts,
They took me to the town;
But sair on ilka weel-kenn'd face
I miss'd the youthfu' bloom.
At balls they pointed to a nymph
Wham a' declared divine;
But sure her mother's blushing cheeks
Were fairer far langsyne!

In vain I sought in music's sound
To find that magic art,
Which oft in Scotland's ancient lays
Has thrill'd through a' my heart.
The sang had mony an artfu' turn;
My ear confess'd 'twas fine;
But miss'd the simple melody
I listen'd to langsyne.

Ye sons to comrades o' my youth,
Forgie an auld man's spleen,
Wha 'midst your gayest scenes still mourns
The days he ance has seen.
When time has past, and seasons fled,
Your hearts will feel like mine;
And aye the sang will maist delight
That minds ye o' langsyne!

GERMAN EXILES.

Michael Koster was one of those unfortunate subjects of Hesse Cassel who were bought by the English government to fight their battles in America. He was taken prisoner at Trenton; and after various vicissitudes, took the first favourable opportunity that presented to make his escape into the interior, where he remained until the conclusion of the struggle which secured the independence of America. Like most of his countrymen, he was frugal and industrious; in the course of a few days he took up a tract of land from the state, cleared a few acres, built a log hut, sowed his first crop, and began to think seriously of getting a wife. This last affair he found to be most difficult. "At length," said he, "I met with mine Kate at an hopsesaw. We danced together, talked over farm affairs, and I accompanied her home. Every thing looked neat and clean about her mother's dwelling, and as she was a good-looking girl, I soon made up my mind. The next time we met I took an opportunity to confess my attachment, found it was reciprocal, and we were finally married." Every thing conspired to render him happy; his wife proved herself worthy of his attachment, managed his dairy, made his butter and cheese, and presented him with several sturdy little children as pledges of their affection. His land repaid their industry, and his wealth increased in proportion. One circumstance alone clouded his felicity; it was the fate of his parents. Of their welfare he heard not a single word; of his fate they must of necessity be ignorant. The village in which they resided had been demolished by the French; and the idea of their destruction in some measure marred his felicity. The arrival of a vessel filled with German redemptioners opened to his mind an avenue of hope. He repaired to Philadelphia, and went on board the vessel, in hopes of obtaining some information on the subject of his errand. His endeavours, however, were fruitless; one old man alone appeared to possess the requisite information; but he was distant and repulsive in his manner: every question seemed to open some galling wound, and awaken some unpleasant situation. Michael felt (to use his own words) "sore upon his heart," and determined to buy the poor man's time. He did so; and they proceeded to have the indentures made out in form. A similarity of name caused an inquiry on the part of the magistrate, and the honest farmer, to his inexpressible delight, discovered his long-lost father!

The old man lived to enjoy the happiness of ease and tranquillity but a few years; the recollection of a wife and children murdered before his eyes could never be effaced; his joy at meeting with a son whom he had ceased to consider as living, combined with his own bodily sufferings, formed such an agitated complication of feelings as eventually destroyed his health: it was one of the son's most pleasing reflections, that he had solaced his declining years and smoothed his passage to the tomb.—*Percy Anecdotes.*

SHOULD BOYS LEARN LATIN?

TAKING up the other day a copy of "Dymond's Essays on the Principles of Morality"—a work of great ability, which appeared a few years ago,* and, as we are glad to learn, has had a considerable circulation—we struck upon the following passages on the subject of classical education: they appear to us so reasonable and convincing, that we think they may with advantage be laid before our readers:—

"Education is one of those things which Lord Bacon would describe as having lain almost unaltered 'upon the dregs of time.' We still fancy that we educate our children when we give them, as its principal constituent, that same instruction which was given before England had a literature of its own, and when Greek and Latin contained almost the sum of human knowledge. Then the knowledge of Greek and Latin was called, and not unjustly called, learning. It was the learning which procured distinction and celebrity. A sort of dignity and charm were thrown around the attainments and the word which designated them. That charm has continued to operate to the present hour, and we still call him a learned man who is skilful in Latin and Greek. Yet Latin and Greek contain an extremely small portion of that knowledge which the world now possesses; an extremely small portion of that which it is of most consequence to acquire. It would be well for society if this word *learning* could be forgotten, or if we could make it the representative of other and very different ideas. But the delusion is continually propagated. The higher ranks of society give the tone to the notions of the rest; and the higher classes are educated at Westminster and Eton, and Cambridge and Oxford. At all these the languages which have ceased to be the languages of a living people—the authors which communicate relatively little knowledge that is adapted to the present affairs of man—are made the first and foremost articles of education. To be familiar with these is still to be a 'learned' man. Inferior institutions imitate the example; and the parent who knows his son will be, like himself, a merchant or manufacturer, thinks it almost indispensable that he should 'learn Latin.'

How stands the fact? When young men leave college to take part in the concerns of active life, how much assistance do they derive from classical literature? Look at the House of Commons. How much does this literature contribute to a member's legislating wisely upon questions of political economy, of jurisprudence, of taxation, of reform? Or how much does it contribute to the capability of any other class of men to serve their families, their country, or mankind? I speak not of those professions to which a dead language may be necessary. A physician learns Latin as he attends the dissecting-room; it is a part of his system of preparation for his pursuits in life. Even with the professions, indeed, the need of a dead language is factitious. It is necessary only because usage has made it so. But I speak of that portion of mankind who, being exempt from the necessity for toil, fill the various gradations of society from that of the prince to the private gentleman. Select what rank or what class you please, and ask how much its members are indebted to ancient learning for their capability to discharge their duties as parents, as men, or as citizens of the state, the answer is literally, 'Almost nothing.' Now this is a serious answer, and involves serious consequences. A young man, when he enters upon the concerns of active life, has to set about acquiring new kinds of knowledge, knowledge totally dissimilar to the greater part of that which his 'education' gave him; and the knowledge which education did give him he is obliged practically to forget—to lay it aside: it is something that is not adapted to the condition and the wants of society. But for what purpose are people educated unless it be to prepare them for this condition and these wants? Or how can that be a judicious system which does not effect these purposes?

* One vol. 8vo. London: Hamilton, Adams, & Co. 1836.

That no advantages result from the study of ancient classics it would be idle to maintain. But this is not the question. The question is, Whether *so many* advantages result from this study as from others that might be substituted; and I am persuaded that we shall become more and more willing to answer, No. With respect to the sum of knowledge which the works of antiquity convey, as compared with that which is conveyed by modern literature, the disproportion is great in the extreme. To say that the modern is a hundred times greater than the ancient, is to keep far from the language of exaggeration. And to say the truth, the majority of those who are educated at college leave it with but an imperfect acquaintance with those languages which they have spent years in professing to acquire. There are some men skilled in the languages; there are some 'learned' men; but the very circumstance that great skill procures celebrity is an evidence that great skill is rare. Amongst educated laymen, the number is very small of those whose knowledge of Latin bears any respectable proportion to their knowledge of their own language—of that language which they have hardly professed to learn at all. If the London University should be successfully established, it is probable that at least one collateral benefit will result from it. The wide range of subjects which it proposes to embrace in its system of education will possess an influence upon other institutions; and the time may arrive when the impulse of public opinion shall reduce the mathematics of one of our universities, and the classics of both, to such a relative station amongst the objects of human study as shall be better adapted to the purposes of human life.

If considerations like these apply to the *preference* of classical learning by those classes of society who can devote many years to the general purposes of education, much more do they apply to those who fill the middle ranks. Yet amongst these ranks the charm of the fiction has immense power. It has descended from universities to boarding-schools of thirty pounds a-year; and the parent complacently pays the extra 'three guineas' in order that his boy may 'learn Latin.' We affirm that the knowledge of Latin and Greek is all but *useless* to these boys, and that if the knowledge were useful, they do not acquire it. What are the stations which they are about to fill? One is to be a manufacturer, and one a banker, and one a merchant, and one a shipowner, and one will underwrite at Lloyd's, and one will be a consul at Toulon. Nay, we might go lower and say, one will be a tanner, and one a draper, and one a corn-factor. Yet these boys must learn Latin, and perhaps Greek too. And they do actually spend day after day, and perhaps year after year, upon 'hic, hæc, hoc,' 'propria quæ maribus,' 'et, *and*; cum, *when*;' and the like. What conceivable relationship do these things bear to making steam-engines, or discounting bills, or shipping cargoes, or making leather, or selling cloth? None.

But, indeed, the children of the middle classes do *not* learn the languages. They do not learn them so as to be able to appreciate the merits and the beauties of ancient literature. Ask the boys themselves. Ask them whether they could hold an hour's conversation with Cicero if he should stand before them. The very supposition is absurd. Or can they read and enjoy Cicero as they read and enjoy Addison? No. They do *not learn* the ancient languages. They pore over rules and exercises, and syntax and quantities, but as to learning the language in the same sense as that in which it may be said they learn English, there is not one in a hundred, nor probably in ten thousand, who does it. Yet unless a person does learn a language so as to read it, at least, with perfect facility, what becomes of the use of the study as a means of elevating the *taste*? This is one of the advantages which are attributed to the study of the classics. But without inquiring whether the taste might not be as well cultivated by other means, one short consideration is sufficient: that the taste is not cultivated by *studying* the classics, but by *mastering* them—by acquiring such a familiarity with these works as enables us to appreciate their excellencies. This familiarity, or any thing that approaches to this familiarity, school-boys do not acquire. Playfair makes a computation from which he concludes, that in ordinary boarding-schools 'not above one in a hundred learns to read even Latin decently well; that is, one good reader for every ten thousand pounds expended. As to speaking Latin,' he adds, 'perhaps one out of a thousand may learn that: so that there is a speaker for each sum of one hundred thousand pounds spent on the language.'

Then it is said that the act of studying the ancient languages exercises the memory, cultivates the habit of attention, and teaches, too, the art of reasoning. Grant all this. Cannot, then, the memory be exercised as well by acquiring valuable knowledge as by acquiring a mere knowledge of words? Would the memory lose any thing by affixing ideas to the words it learnt? The same questions apply to those who urge the habit of attention, and to all those advocates of the study who insist upon the exercise which it gives to the mind. We do not question the utility of this exercise; we only say that *while* the mind is exercised it should also be fed. That such topics of advocacy are resorted to is itself an indication of the questionable utility of the study. No one thinks it necessary to adduce such topics as reasons for learning addition and subtraction.

The intelligent reader will perceive that the ground upon which these objections to classical studies are urged is, that they occupy time which might be more beneficially employed. If the period of education were long enough to learn the ancient languages *in addition* to the more beneficial branches of knowledge, our inquiry would be of another kind. But the period is not long enough: a selection must be made; and that which it has been our endeavour to show is, that, in selecting the classics, we make an *unwise* selection.

There is, according to my views, no study that is more adapted to please and improve young persons than that of natural philosophy. When I was a school-boy I attended a few lectures on the air-pump, galvanism, &c., and I value the knowledge which I gained in three evenings more highly than any other that I gained at school in as many months. Whilst our children are poring over lessons which disgust them, we allow that magazine of wonders which heaven has stored up to lie unexplored and unnoticed. There are multitudes of young men and women who are considered respectably educated who are yet wonderfully ignorant of the first principles of natural science. Many a boy who has spent years upon Latin cannot tell how it comes to pass that water rises in a pump; and would stare if he were told that the decanters on the table were not colder than the baize they stand on."

After advocating the study of political economy, zoology, and other branches of useful knowledge, the author proceeds—"These are general suggestions: details are foreign to our purpose; but from these suggestions the intelligent parent will perceive the *kind* of education that is proposed. If such an education would convey to young persons some tolerable portion of 'the knowledge and the spirit of their age and country,' if it would tend to make them 'useful, respectable, and happy' in the various relationships of life, the objects of intellectual education are in the same degree attained. So limited is the opportunity of the young for acquiring knowledge in comparison with the extent of knowledge itself, that, upon some subjects, little more is to be effected during the years that are professedly devoted to education than to induce the desire of information and the habit of seeking it. A boy cannot be expected to acquire very extensive information respecting the application of the mechanical powers; but if he sees the value and the pleasure of studying it, he may hereafter benefit his country and the world by his ingenuity. Or a boy cannot be expected to know more than the elements of chemistry; yet this knowledge may in future enable him to add greatly to the comforts and conveniences of human life. There are indications of a revolution in the system of education, which will probably lead both to great and beneficial results. Science is evidently gaining ground upon the judgments and affections of the public. Elementary books of science are, indeed, the familiar companions of young persons *after they have left school*. They lay aside tenses and parsing for 'conversations on chemistry.' This is, so far, as it should be; and it would be better still if similar books had taken the place, *at school*, of accents and quantities, and cases and genders, and lesson-learning by rote. This revolution is also indicated by the topics which are introduced into mechanics' institutes. These associations seem almost instinctively to prefer science to literature, simply as such. Perhaps it will be said that science is the branch of knowledge which is more peculiarly adapted to their employments in life. But the scientific information which an individual acquires usually produces little immediate effect upon his mode of working. The carpenter cannot put up a staircase the better for attending a lecture on chemistry. No: they prefer science because it is preferable: preferable not for mechanics merely, but for man. It is of less consequence to man to know what Horace wrote, or to be able to criticise the Greek anthology, than to know by what laws the Deity regulates the operations of nature, and by what means those operations are made subservient to the purposes of life."

CLAY MAPS.

We have been shown a clever mode of representing countries, for the purpose of teaching geography to young persons. It consists in making a map in relief by means of potter's clay. The clay is put into a mould properly cut, and the cast being brought out is forthwith baked in an oven, the same as an ordinary piece of pottery. The specimen brought under our notice is a map of Europe, about a foot square. The various countries are raised with their appropriate ranges of mountains; and the whole being variously coloured and impressed with their respective names, also the names of the principal cities, any country or town can at once be pointed out. The seas, rivers, and lakes, form the sunk parts, and these being filled with water, which an environing ledge prevents from running over, both land and water are most effectually represented. As cheap and instructive toys for children, or as ornaments for the cottage chimney-piece, we recommend these clay maps to notice. The inventor is a modest young man, a teacher in Glasgow (Mr John Neilson, St Mungo's School), who has brought the subject to bear under many disadvantages.

USES OF THE POTATO.

The uses to which the potato may be put besides the obvious ones of food, starch, sugar, and spirits, are much more various than most people are aware of. In Thuringia and Saxony, it is made into a kind of cheese, which will last for years if kept in close vessels. To pursue the description given in the "Quarterly Journal of Agriculture"—"It is prepared by boiling the potatoes, and reducing them when cold to a pulp, rejecting the skins. Sour milk is added, or else sweet curd with the whey pressed out, in the proportion of a pint to five lbs. of pulp. It is kneaded several times, drained in small baskets, and simply dried in the shade. In some parts of Germany, potatoes are put to another use. The lower classes are accustomed to incorporate them, after being steamed and reduced to a paste, with the butter to be spread over bread. It thus goes farther where economy is studied; and, that it may longer be preserved, is often salted. It will surprise many to learn that a mode has been suggested by a French chemist for converting potatoes into a substance like coffee. He mixes some of the best olive-oil with a certain portion of dried potato flour, and then adds a small quantity of coffee-powder. He asserts that this will produce a liquor more agreeable than coffee. Chemical ingenuity has likewise converted this most useful root into substitutes for many other articles—as chocolate, tapioca, and vermicelli. The use of potato-starch instead of arrow-root I have already mentioned; and much of it is at present sold under the name of arrow-root, and in France under that of *fécule de pomme de terre*. A chemist in Copenhagen has discovered that the flowers of the plant may be used in dyeing. By this means a beautiful yellow colour may be obtained, which is solid and durable. By plunging the colour into blue, it becomes a perfect green. It has likewise been found that the juice contained in the potato will produce a grey colour of great beauty. The liquor drawn off in the process of making potato-starch will clean silks, woollens, or cottons, without damage to the texture or colour. It is also good for cleaning wainscots. Potatoes are used with excellent effect in the boilers of steam-engines, for preventing the gathering of a calcareous incrustation on the bottom, which is gradually deposited from the water employed. The potatoes give out a glutinous substance which entangles the particles in the water, and prevents them from incrusting the iron of the boiler. A medical use of the potato has been lately suggested in a valuable French publication, namely, as a preventive of, and even a cure for, the scurvy. Roasted potatoes were administered with perfect success to sailors afflicted with the disorder, after other approved medicines had been given in vain. As roasted potatoes are the most effectual, it seems probable that the remedy depends on some of the substances contained in the black liquid which boils out of potatoes, and which are retained in roasting."

ENGLISH ARISTOCRATIC EDUCATION.

We are a great nation, and nowhere is our greatness more conspicuous than in the education of youth. The young Frenchman seems to fulfil his destiny when, having drawn on a pair of the most tight-fitting kid gloves, of that precise shade of colour so approved of by Madame Laffarge, he saunters forth to the Boulevard de Grand, or lounges in the *coulisse* of the opera. The German, whose contempt not only extends to glove-leather, but clean hands, betakes himself early in life to the way they should go, and from which, to do him justice, he never shows any inclination to depart. A meerschaum some three feet long, and a tobacco-bag like a school-boy's satchel, supply his wants in life. The dreamy visions of the unreal woes, and the still more unreal greatness of his country, form the pabulum for his thoughts; and he has no other ambition, for some half-dozen years of his life, than to boast his utter indifference to kings and clean water. Now, we manage matters somewhat better. Our young men, from the outset of their career, are admirable jockeys; and if by any fatality, like the dreadful Revolution of France, our nobles should be compelled to emigrate from their native land, instead of teaching mathematics and music, the small sword and quadrilles, we shall have the satisfaction of knowing that we supply stable-boys to the whole of Europe.—*Dublin University Magazine.*

A CAUSE OF FAILURE IN LIFE.

Many men fail in life from the want, as they are too ready to suppose, of those *great* occasions wherein they might have shown their trust-worthiness and their integrity. But all such persons should remember, that in order to try whether a vessel be leaky, we first prove it with *water* before we trust it with *wine*. The more minute, trivial, and we might say *vernacular*, opportunities of being just and upright, are constantly occurring to every one; and it is an unimpeachable character in these lesser things, that almost invariably prepares and produces those very opportunities of greater advancement and of higher confidence which turn out so rich a harvest, but which those alone are permitted to *reap* who have previously *sown*.—*Lacon.*

DEW.

The dew, celebrated through all times and in every tongue for its sweet influence, presents the most beautiful and striking illustration of the agency of water in the economy of nature, and exhibits one of those wise and bountiful adaptations, by which the whole system of things, animate and inanimate, is fitted and bound together. All bodies on the surface of the earth radiate, or throw out rays of heat, in straight lines—every warmer body to every colder; and the entire surface is itself continually sending rays upwards through the clear air into free space. Thus on the earth's surface all bodies strive, as it were, after an equal temperature (an equilibrium of heat), while the surface as a whole tends gradually towards a cooler state. But while the sun shines, this cooling will not take place, for the earth then receives in general more heat than it gives off; and if the clear sky be shut out by a canopy of clouds, these will arrest and again throw back a portion of the heat, and prevent it from being so speedily dissipated. At night, then, when the sun is absent, the earth will cool the most; on clear nights, also, more than when it is cloudy; and when clouds only partially obscure the sky, those parts will become coolest which look towards the clearest portions of the heavens. Now, when the surface cools, the air in contact with it must cool also; and, like the warm currents on the mountain side, must forsake a portion of the watery vapour it has hitherto retained. This water, like the floating mist on the hills, descends in particles almost infinitely minute. These particles collect on every leaflet, and suspend themselves from every blade of grass, in drops of "pearly dew." And mark here a beautiful adaptation. Different substances are endowed with the property of radiating their heat, and of thus becoming cool with different degrees of rapidity; and those substances which in the air become cool first, also attract first and most abundantly the particles of falling dew. Thus, in the cool of a summer's evening, the grass plot is wet while the gravel walk is dry; and the thirsty pasture and every green leaf are drinking in the descending moisture, while the naked land and the barren highway are still unconscious of its fall.—*Professor Johnstone on Agricultural Chemistry.*

DECISION.

ALL wisdom is a system of balances. It is allowed that caution and deliberation are good things; but in many circumstances these are false friends, and it is found afterwards that a less considerate policy would have been best. Again, however, it would be very wrong to counsel a bold policy as invariably preferable to a cautious one: it would often be found dangerous. There is, in short, no maxim which is a specific: conditions modify the eligibility of every one of them.

With regard to decision in conduct, the first great point is to know what to decide upon, and the second to know if the plan adopted should be unflinchingly carried out. Many men are remarkably decisive without being wise, or finding their choice a fortunate one. Many hold firmly enough to their plan, when wisdom would rather recommend its being abandoned. Decisiveness of conduct is, in such cases, manifestly no advantage. But when a quick and far-seeing sagacity has once chosen a right course, it is well to adopt it unhesitatingly, cordially, fully, and to go through with it with boldness and energy. Then is decision in conduct found to be a valuable quality—but then only. There is no point in which more mistakes are made. A vast number of men think they are acting with decision, when they are simply rash and headstrong. Many believe they are *thinking* with decision when they are merely uncandid towards all opposing considerations, wise in their own conceit, and perilously obstinate.

It often happens, nevertheless, that decisive men of this kind can point to their happy instances. Conduct like theirs is now and then attended by good fortune. But such cases are only like the dreams that prove true—strongly remarked, while all the false ones are lost sight of. They no more justify the rashness and obstinacy of the parties, than does a death happening soon after the hearing of the death-watch prove that there is a connexion between the perforations of the insect and human mortality. These instances are the ruin of the unwise decisive men, for they encourage the fatal failing. Perhaps successful in one case, which involved no important results, they are emboldened to try the same plan in a very different one, and are sadly punished. Such blindfold decision is, indeed, only a kind of gambling.

In aiming at decisive thinking on controversial subjects, and at the duty and credit of holding fast by opinions, it is important to guard against similar errors. It is easy, by shutting one's eyes to every thing that can be said on the opposite side, and getting one's self-love interested in the matter, to obtain a very comfortable set of very decided opinions, and thus become a respectable sort of wronghead or bigot. But it is not so easy, out of the contending considerations on all sorts of difficult questions, to select such as may form a reasonably sound set of opinions, in adherence to which there may be genuine usefulness and real honour. On the contrary, many of the soundest heads have been amongst the most hesitating on a certain dubious class of subjects. It is easy to laugh at the difficulties and doubts of a Lord Eldon, and to admire the nimbleness of some other men in the same situation; but it is by no means certain that quick decisions in law, any more than in speculative questions, are the best. Mr Canning describes a man as swearing,

——— "with keen discriminating sight,
Black's not so black, nor white so very white."

But, though such a manner of speaking is apt to convey a notion of weakness or hesitation, we should remember that the patient separation of the true from the false, and the correct adjustment of the respective limits of both, are amongst the highest efforts of the logical intellect. Perhaps there are some things on which to talk decisively is only to make an open declaration of short-sightedness and folly.

We see more clearly the value of decision in conduct than that of decision in forming a set of abstract opinions. It must ever be of vast consequence to be able to decide at once upon what is the best course of procedure in any of the affairs of life. It often happens that the reasons for taking a particular step are made a little obscure and dubious by the presence of some advantage connected with the opposite course, or by a difficulty and disadvantage attending the right one. For example, in the great fire at Hamburg, it became evident that no expedient for stopping the conflagration would be effectual but the forming of a gap in the buildings. Here the great difficulty of the senate was to determine on making a large enough sacrifice of buildings, for the buildings were of course valuable, every body was interested for the saving of his own house, and there was still the hope that the flames might not come so far, in which case the sacrifice would have been made needlessly. On the other hand, the risk from making too small a sacrifice was obvious, for the fire was advancing, and it might come up to the site marked out for a gap before the gap was effectually made, when of course a much larger gap would become necessary. It was a fine case for the exertion of a wise decisiveness of judgment. In this, unfortunately, the senate failed. They could not take a sufficiently liberal view of the required sacrifice. The gap which they made was made in vain; the flames went on, and were only finally stopped by a perhaps ten times greater sacrifice.

One of the finest examples of this wise decisiveness on record occurs in the earlier part of Napoleon's historical life. He had made his wonderful irruption into Northern Italy, and overthrown great bodies of the Austrian troops. Little seemed wanting to complete the conquest of Lombardy but the taking of Mantua, to which he devoted 10,000 of his troops. At this juncture, he heard of the approach of a new Austrian army, consisting of 60,000 men, while he had in all only 40,000. By marching quickly along the banks of the Lake of Garda, they cut off his retreat to Milan, which he felt to endanger his position very materially. But the Austrian army came on both sides of the lake, 20,000 on the one and 40,000 on the other. Napoleon determined to take a position at the end of the lake, so as to be between the two parties when they came to join. To pursue the narrative of M. Thiers—"By rapidly forming a main mass, the French might overpower the 20,000 who had turned the lake, and immediately afterwards return to the 40,000 who had defiled between the lake and the Adige. But, to occupy the extremity of the lake, it was necessary to call in all the troops from the Lower Adige and the Lower Mincio; Augereau must be withdrawn from Legnago and Serrurier from Mantua, for so extensive a line was no longer tenable. This involved a great sacrifice, for Mantua had been besieged during two months, a considerable battering train had been transported before it, the fortress was on the point of capitulating, and, by allowing it to be revictualled, the fruit of these vigorous efforts, an almost assured prey, escaped his grasp. Bonaparte, however, did not hesitate; *between two important objects, he had the sagacity to seize the most important and sacrifice to it the other*—a simple resolution in itself, but one which displays not alone the great captain but the great man. It is not in war merely, it occurs in politics and in all the situations of life, that men encounter two objects, and, aiming to compass both, fail in each. Bonaparte possessed that rare and decisive vigour which prompts at once the choice and the sacrifice. Had he persisted in guarding the whole course of the Mincio, from the extremity of the Lake of Garda to Mantua, he would have been pierced; by concentrating on Mantua to cover it, he would have had 70,000 men to cope with at the same time—60,000 in front and 10,000 in the rear. He sacrificed Mantua, and concentrated at the point of the Lake of Garda." The consequences were an admirable reward of the genius shown on the occasion. He first met the corps of 20,000 under Quasdanovich, or rather its advanced parties, which he easily drove back. The Austrian general, surprised to find everywhere imposing masses of the French, was awed, and resolved to halt till he should hear of the other corps under his commander Wurmser. Here the Napoleon genius was again shown, for, guessing what was passing in Quasdanovich's mind, he contented himself with having brought him to a pause, and turned to meet the other party. Of this corps a large portion had passed on with Wurmser to Mantua, leaving 25,000 behind under Bayalitsch. This army advanced with wide-spread wings to envelop the French; but Napoleon penetrated its weakened centre; it lost courage, and withdrew. The French pursued, and greatly damaged it. Other actions ensued; and in six days from the commencement of hostilities, the Austrian generals were again in retreat to the Tyrol, having lost 20,000 men and the kingdom of Lombardy.

In private life, this firmness in making judicious sacrifices is often of great importance. It is as necessary to know when to make such sacrifices, and, it may be added, when to undergo great hazards, as it is to know when to embrace favourable opportunities. Many a commercial man has saved the bulk of his fortune by being able to bring his mind, at some nice juncture, to incur a certain loss, or to expose himself to some considerable risk. It requires a certain liberality of nature to act in this way. The race of narrow wits lose all by clinging desperately to some coward maxim which they can only interpret literally. "Never lose certainty for hope," "A bird in the hand is worth two in the bush," are their favourite adages—and very good adages they are in most circumstances, but not in all, for it sometimes happens that to make a venture is the best course, not merely for making an advance, but for retaining the present position; and it is abundantly clear that, had those maxims always been adhered to, the world must have stood still almost from the beginning. The liberal-minded, on the other hand, can give a wide enough interpretation to such apothegms, and, if possessed of wisdom, know exactly in any particular case whether they should be rigidly observed or not. To attain to this liberality of mind and this power of judging, and be able to act vigorously and perseveringly in the course adopted, are the grand requisites in this branch of the philosophy of life.

A hesitating, indecisive, and over-cautious manner serves as ill in the most simple and familiar affairs as in the highest; and its consequences are in proportion as bad. To have two things which we wish to do nearly about the same time, and to try to embrace them both in the same morning's labours, or accomplish them by the same walk, usually leads to their not being either of them done well, or in time. The whole pleasure of a day devoted to that object is often lost by a want of decision as to the mode of procedure, or the things to be attempted or done, while all would have been well if a right and rational plan had been started with and rigidly adhered to.

In short, and in fine, decision is a most important quality in all affairs, and particularly in affairs of difficulty; but rashness is not decision; uncandour is not decision; headlong, blundering stupidity is not decision—no, it is only to be exemplified by those who, with expanded and sagacious minds to appreciate circumstances and judge of what is best to be done, possess the firmness to go straight forward with an enlightened resolution.

LIVES OF THE ANGLO-SAXON WRITERS.

The commencement of a splendid design by the Royal Society of Literature—no less than a complete chronological series of British literary biography—presents us with a volume on the Anglo-Saxon writers, by Mr Thomas Wright,* one of those youthful students of antiquities who at present form a somewhat conspicuous class of our intellectual labourers. Mr Wright has executed his task with a degree of diligence, judgment, and good taste, entirely worthy of the whole design to which he is a contributor. His volume will convey to unlearned readers a surprising notion of the extent to which literature flourished amongst the children of the Heptarchy. They will not be prepared to hear that "in England, during the eighth century, the multiplication of books was very great," that religious, political, and narrative poetry were then written both in Latin and in the native tongue, and that even ladies kept up correspondence in the former language with the principal learned men of the time. Yet the fame of some of the writers of that period may be said to be still very generally diffused. Few have not heard of Bede, of Alfred, and of Dunstan. With hardly any exception but that of Alfred, the literary men of England in the Anglo-Saxon period were churchmen or monks. They were the teachers as well as pastors of their flocks, and both wrote books and undertook the duty—equivalent to that of the printer amongst us—of multiplying them. It is impossible to read a just account of these men, devoting themselves in their little cells, often at a distance from all society, to the business of cultivating and diffusing letters, without acknowledging that in their time they were a most useful and praiseworthy part of the community.

Bede, perhaps, stands at the head of the Anglo-Saxon writers. He seems to have spent a modest studious life, unchequered by incident of any kind, at the monastery of Wearmouth, where he died in 735. His works, consisting of Scriptural translations and commentaries, religious treatises, biographies, and an ecclesiastical history of the Anglo-Saxons, which is the only one useful in the present age, were *forty-four* in number; and it is related that he dictated to his amanuensis, and completed a book, on the very day of his death. Alfred, who may be said to have been a century and a half at least posterior to Bede, was also a copious writer, notwithstanding the duties and cares of sovereignty. He translated the historical works of Orosius and Bede, and some religious and moral treatises; also Æsop's Fables and the Psalms; and there is a collection of proverbs attributed to him. Original writing is mingled with some of his translations. He was also zealous to introduce learned men into his country, and to establish seminaries of learning, though the story of his having commenced the University of Oxford is shown by Mr Wright to be liable to strong suspicion. Mr Wright relates a well-known anecdote of Alfred in a somewhat various way:—

"During the first eight years of his reign, Alfred was engaged in constant warfare with the Danes, until, in 878, after numerous battles fought with various success, his fortunes were reduced so low that he was compelled to seek a shelter with a small body of his most faithful companions in the wilds and woods of Somersetshire. His chief abode was in the isle of Athelney, where a remarkable monument of his misfortunes has since been found, in a beautiful enamelled jewel bearing his name, and now preserved in the Ashmolean Museum at Oxford. This spot was the scene of the interesting legend, so often repeated by modern writers, which appears to have been current in the latter part of the tenth century. The king, according to the oldest document in which this legend is noticed, 'then went lurking through hedges and ways, through woods and fields, so that he, through God's guidance, arrived save at Athelney, and begged shelter in the house of a certain swain, and even diligently served him and his evil wife. It happened one day that this swain's wife heated her oven, and the king sat thereby, warming himself by the fire, the family not knowing that he was the king. Then was the evil woman suddenly stirred up, and said to the king in angry mood, 'Turn thou the loaves, that they burn not: for I see daily that thou art a great eater.' He was quickly obedient to the evil woman, because he needs must.'" It thus appears that the woman only thought that one who assisted so large in eating her household bread should help to prepare it; not that she gave him a box in the ear, as the story commonly goes, for neglecting to turn certain loaves with the firing of which he had been intrusted.

Dunstan seems to have been a very extraordinary person. He was born in 925 near Glastonbury Abbey, and studied in the school at that place. When we read the narrative of his life, we can see very easily that he was indebted for his great distinction not to talent alone, but in part to what would now be considered as a constitutional tendency to delirium. He was liable to fall into a peculiar morbid condition, in which he saw wonderful visions, usually of a religious character. Such things would now be pitied and lamented; in the tenth century, they created awe and admiration. While a young man, he went to Canterbury to visit his uncle Athelm, the archbishop, who introduced him at court. His handsome face and figure, and many accomplishments, amongst which was first-rate skill in playing the harp, made him a great favourite with King Athelstan, but gained him the envy of the courtiers, whose machinations drove him from the palace. Placing himself under the care of another uncle, Alfheh, bishop of Winchester, he there became "passionately enamoured of a maiden of great beauty, of a rank in life equal with his own, and endowed with the accomplishments congenial to his own character, and he sought permission to marry her. But his uncle Alfheh was opposed to the union; he probably foresaw in some measure the splendid destiny which awaited his nephew, and he urged him to overcome his passion, and to embrace the strict rule of monastic life, then prevalent in France, but which had not yet been introduced into this island. Dunstan avowed his distaste for monachism, and refused to act according to his uncle's admonitions. The struggle of contending feelings which arose out of these circumstances brought on a new and severe attack of his disease; and while languishing under a burning fever, his uncle came to his bedside, recommenced his exhortations to embrace a monastic life, and told him that he was now suffering under the effects of God's displeasure for having preferred an earthly bride to the Church of Christ. The words of the bishop had a deep effect upon his mind, and he appears to have made a vow that if he recovered he would retire from the world.

Dunstan fulfilled his vow in a manner that was no less extraordinary than the circumstances of his previous life. He built for himself, adjacent to the walls of the church of Winchester, a little cell, the larger portion of which was sunk below the level of the earth, and which was so small that he could scarcely raise himself upright in it. In this narrow receptacle Dunstan made his dwelling, and he only left it when required to perform the necessary acts and duties of his life. The period of his time which was not passed in devotional exercises, was here employed in the practice of the arts, and numerous branches of knowledge in which he was proficient. Dunstan was distinguished by his fondness for science and the mechanical arts, and he was probably acquainted with many instruments and modes of proceeding which, though their principle is now well understood, were then believed to be the work of superhuman agency. His biographer has preserved one of the incidents that drew upon Dunstan the charge of magic. It seems that before he left the court of Athelstan, he had invented a harp which played spontaneously. A noble lady, named Ethelwynn, who was acquainted with his skill in drawing and design, begged his assistance in ornamenting a handsome stole. Dunstan, as usual, carried with him his harp, which, when he entered the apartment of the ladies, he hung beside the wall; and in the midst of their work they were astonished by strains of excellent music which issued from the instrument. Dunstan had in his cell a forge, at which he manufactured the articles of metal that were necessary for the use or ornament of the church, while he rendered similar services to the people who visited him. He was skilful also in writing and painting (or illuminating), and frequently practised these arts in his cell; while at times the sound of the hammer gave place to that of his harp.

It is not surprising if, in this solitary and uncomfortable abode, Dunstan frequently laboured under the monomania, as it has been described, to which he was constitutionally subject. He believed himself continually persecuted by demons. It is pretended that on one occasion, in the night, when Dunstan was employed as usual at his forge, the devil came to his hut in the form of a man, and brought him a piece of iron which he wished to be beaten into a certain form. Dunstan willingly undertook the work, but, led by some circumstances to suspect the trick which was put upon him, he watched an opportunity, and suddenly seizing the fiend by the nose with his red-hot tongs, forced him to resume his own proper shape. The howling of the tempter was audible for miles round the cell, and when the terrified inhabitants came next morning to Dunstan to inquire the cause, it is said that they heard this story from his own lips." It is remarkable how much resemblance there is between some of the incidents of Dunstan's biography and those in the lives of the reformers of the sixteenth and seventeenth centuries. Luther also had his struggles with the evil one, and threw an inkstand at him. Like them, Dunstan had his visions of events yet to come. When obliged, by the persecution of King Edwy, to leave his church of Glastonbury, it rung with unearthly laughter, and the pious abbot, turning again, addressed the invisible demon in the following words:—"Go on, for thou shalt soon have more cause to lament for my return than to rejoice now at my departure." This prediction is perfectly identical with that of John Knox in the French galleys. There is a cheap and easy kind of prophecy by which Dunstan acquired no small part of his fame, consisting in a foretelling of events known to be extremely likely or even threatened. When officiating at the coronation of the murdered Ethelred, he foretold that the sword should not cease its visitations on his house till the throne should have passed to a nation of strangers. In the *third* year thereafter arrived the first flight of the Danish invaders, who in quick time subdued the kingdom. Can we doubt that the invasion was at this very time threatened, and that Dunstan foresaw the likelihood of its success in the distracted and weak state of the existing government?

This pious man was supposed to do many wonderful things by the black art, when, probably, the only witchcraft which he used was a mechanical skill above his age. At one time the prejudices against him rose so high on this account, that some of his neighbours seized him one day and threw him into a pond, probably to judge of his wizardship by his sinking or swimming. Mr Wright adds:—"What was in part the nature of Dunstan's studies while at Glastonbury, we may surmise from the story of a learned and ingenious monk of Malmesbury, named Ailmer, who, not many years afterwards, made wings to fly, an extraordinary advance in the march of mechanical invention, if we reflect that little more than a century before Asser the historian thought the invention of *lanterns* a thing sufficiently wonderful to confer an honour upon his patron, king Alfred. But Ailmer, in the present instance, allowed his zeal to get the better of his judgment. Instead of cautiously making his first experiment from a low wall, he took flight from the top of the church-steeple, and, after fluttering for a short time helplessly in the air, he fell to the ground and broke his legs. Undismayed by this accident, the crippled monk found comfort and encouragement in the reflection, that his invention would certainly have succeeded had he not forgotten to put a tail behind."

In the school-books used in the Anglo-Saxon period, it is curious to find both the system of question and answer, by which so much is now learned, and also that which has been called the Hamiltonian system, by which a foreign tongue is presumed to be acquired by an interlinear translation. For the sharpening of youth [*ad acuendos juvenes*], they had arithmetical problems, such as are still to be found in some treatises of the present age; as, for instance, "The swallow once invited the snail to dinner: he lived just one league from the spot, and the snail travelled at the rate of only one inch a day: how long would it be before he dined?" Again: "An old man met a child, 'Good day, my son!' says he; 'may you live as long as you have lived, and as much more, and thrice as much as all this, and if God gives you one year in addition to the others, you will be just a century old:' what was the lad's age?" In one of these school-books a ship is defined rather beautifully as "a wandering house, a hostle where you will, a traveller that leaves no footsteps, a neighbour of the sand." Enigmas were favourite modes of intellectual exercise in those days, and many collections of them were made. For instance—"What is that from which, if you take the head, it becomes higher? *Answer*—Go to your bed, and there you will find it." Here the joke seems to lie in the ambiguity of the expression; take your head from bed, and it (namely, your head) is of course higher. There was great ignorance, of course, of all the natural sciences, and of none more so than medicine. An ancient manuscript in the British Museum gives a striking picture of the low state of this branch of knowledge. One large section of the book relates to external injuries—as wounds and bites of venomous reptiles. There are also many receipts against poison; all of them significant matters. What appears singular, there are more provisions against diseases of the eye than against any other ailment. "Although this treatise is not a herbal, still the ingredients mentioned are chiefly vegetables, though mixed up sometimes with other substances, such as ale and honey, of which latter commodity the consumption was very great among the Anglo-Saxons, and, less frequently, fat, oil, or wine. The powerful medicinal effects produced by vegetable mixtures, and the facility with which they were obtained, will easily explain the great reputation they enjoyed in an uncultivated age; but the real causes of diseases were little known; the connexion between the complaint and the remedy was seldom or very imperfectly understood; and the success of the latter must have been extremely problematical. The object generally aimed at seems to have been to produce a sudden and strong impression on the system, the effect of which must often have proved fatal."

This treatise, Mr Wright remarks, shows how much superstition was mixed with the practice of medicine. "The ingredients which the physician used frequently owed their virtues to some accidental circumstance with which, in the minds of the people, they were connected; as in the case of one receipt in which those particular herbs only are declared to be efficient 'which grow spontaneously, and are not planted by the hand of man.' Much of their efficiency also depended upon the day on which they were administered, or on which the patient fell ill, and this, again, was regulated by the changes of the moon. The Anglo-Saxon manuscripts contain many lists of the attri-

* Biographia Britannica Literaria, or Biography of Literary Characters of Great Britain and Ireland, arranged in Chronological Order. Anglo-Saxon Period. By Thomas Wright, M.A., 8vo., pp. 554. London: J. W. Parker. 1842.

butes of each day of the lunar month, as they were supposed to be good or evil for sickness and the various operations of life. For example, they inform us that 'The first day of the moon is propitious for all kinds of work; he who falls ill on that day will languish long and suffer much; the infant who is then born will live. The second is also a prosperous day, good for buying, selling, embarking on shipboard, beginning a journey, sowing, grafting, arranging a garden, ploughing land; theft committed on this day will be soon and easily detected; a person who falls sick will soon recover; the child born will grow fast, but will not live long;'" and so on, with many similar delusions. A proof that these fancies were practically worked upon, occurs in the life of John of Beverley. "One day John entered the nunnery of Wetadun (supposed to be Watton in Yorkshire), where the abbess called him to visit a sister in whom the operation of bleeding had been followed by dangerous symptoms. When he was informed that she had been bled on the fourth day of the moon, he blamed the abbess severely for her ignorance; 'for,' said he, 'I remember that Archbishop Theodore, of blessed memory, said that bleeding was very dangerous at that time, when both the light of the moon and the flood of the ocean are on the increase.'"

With one good anecdote of the poet Aldhelm, who was abbot of Malmesbury, we take leave of Mr Wright's volume:—"Aldhelm had observed, with pain, that the peasantry were become negligent in their religious duties, and that no sooner was the church service ended, than they all hastened to their homes and labours, and could with difficulty be persuaded to attend to the exhortations of the preacher. He watched the occasion, and stationed himself in the character of a minstrel on the bridge over which the people had to pass, and soon collected a crowd of hearers by the beauty of his verse; when he found that he had gained possession of their attention, he gradually introduced, among the popular poetry which he was reciting to them, words of a more serious nature, till at length he succeeded in impressing upon their minds a truer feeling of religious devotion; 'whereas, if,' as William of Malmesbury observes, 'he had proceeded with severity and excommunication, he would have made no impression whatever upon them.'"

THE TWO BEGGAR BOYS:

A STORY FOR THE YOUNG.

"I CAN'T encourage a boy of your age in begging," said a gentleman to a little lad, apparently about ten years old, who intreated him to give him a halfpenny; "you should work, not beg."

"I have not got any work," answered the boy.

"Would you do it if you had?" inquired the gentleman.

"Yes," said the boy.

"What are your parents?" asked the gentleman.

"My father's dead," replied the child, "and my mother begs, and sends me out to beg; but I keep away from her, because she beats me."

"And where do you sleep at night, when you don't go home?"

"Anywhere I can—under a hedge, or in a doorway; sometimes I get into a stable-yard or an empty cart."

"That's a miserable life," returned the gentleman: "come with me, and I'll give you a trial. What is your name?"

"George Macmahon."

"Come along, then, George Macmahon. Now, if you are wise, this may prove the turn of your fortune; but remember, beginnings are slow: you must work first for small wages, till you are stronger, and able to earn more; but if I see that you are willing to work, I will do what I can for you."

This gentleman, whose name was Herriott, was the overseer of some public works; so, as George's capabilities were yet but limited, he put a hammer into his hand, and set him to break stones, promising that if he were diligent, and broke as many as he could, he should have eightpence a-day, and a place to sleep in at night.

George Macmahon set to his work apparently with a good heart. The stones were not very hard, and they had already been broken into small pieces—his business was to break them still smaller; and when he exerted his strength and struck them a good blow, he could do it very well. However, when he had worked a little while, he began to make rather long pauses between his strokes, and to look a good deal about him, especially when any well-dressed persons passed that way; and once or twice, when he thought no one was looking, he threw down his hammer, and applied himself to his former trade of begging for a halfpenny to buy a bit of bread. When he had, in this way, made out some three or four hours, he was accosted by an acquaintance of his, a boy about his own age, who was also a beggar. The only difference in their situation was, that the mother of the latter was very sickly and unable to support him; but she did not beat him, and would not have sent him to beg if she could have done anything better for him.

"What!" said the new-comer, whose name was John Reid; "have you got leave to break stones?"

"Yes," answered George, "a gentleman has given me a job; I am to have eightpence a-day, and a place to sleep in;" and George at that moment felt himself a person of considerable consequence.

"I wish he would give me a job too," said John; "do you think he would?"

"You can ask him, if you like," answered George; "that's his office, and I saw him go in there just now." So John presented himself to Mr Herriott, and said he should be very glad if he would give him a job, as he had done to George Macmahon; and after asking him a few questions, Mr Herriott supplied him with a hammer, and set him to work.

It was quite evident, from the way he set about it, that it was John Reid's intention to break as many stones as he could; and accordingly, by night his heap was much larger than George Macmahon's, although he had not worked so long; but then he hit them with all his might, did not make long pauses between his strokes to look about him, and, when any well-dressed persons passed, instead of slipping away to beg for a halfpenny, he only grasped his hammer with more firmness, gave harder blows, and appeared more intent upon his work; for, thought he, it makes one look respectable to be employed, but every body despises beggars. At night they each got their eightpence, for although George had not worked as hard as he could, Mr Herriott did not wish to discourage him; and having bought themselves some supper, they were conducted to a shed, where they passed the night on some clean straw—a much more comfortable bed than they were accustomed to. On the following morning, they both repaired to their toil at the sound of the bell—John Reid with rather augmented vigour; but after the first half hour, George Macmahon's strokes became lighter and his pauses longer, till at last he threw down his hammer, and burst out into a fit of laughter.

"What's the matter?" said John; "what are you laughing at?" "Why, I am laughing to think what fools the gentlefolks must be to suppose we'll work for eightpence a-day at breaking these stones, when we can earn a shilling a-day by begging, and our food besides; for people give us enough to eat at their doors, and then we can spend our money in drink."

"But, then," said John, "we are only beggars, and that's such a disgrace."

"Disgrace!" said George, "pooh! who cares for that?—surely it's better to live without working, if one can?"

"I don't know that," said John: "besides, you know, if we go on begging, we shall never get to be better off—we shall always be beggars to the last; but if we work when we are young, we may grow rich by the time we are old, and live like the gentlefolks."

"It's a long time to wait for what may never happen," replied George; "besides, I'm tired of work—it makes my arm ache: there's a carriage coming down the hill with some ladies in it!" added he suddenly, and away he ran to beseech the ladies to give him a halfpenny to buy a bit of bread. They threw him sixpence. "Now, look here," said he to his comrade; "here's nearly a day's wages just for the asking; one must break a pretty lot of stones before one earns sixpence. Come along; throw down your hammer, and let's be off before Mr Herriott sees us."

"No, I sha'n't," responded John; "I shall stay here and break the stones; but I wish, if you mean to go, you would call and tell my mother where I am, and that she shall see me on Sunday."

"Sunday!" cried George; "you don't mean to stay here till Sunday, do you?"

"Yes, I do," said John; "I'll stay as long as they'll keep me."

George went away laughing at the folly of his companion; and when he met Jane Reid begging, he told her she might expect to see John before Sunday, for he was sure his arm would be so tired that he would soon give up breaking stones.

But George was mistaken: John's arm did ache at first, it is true, but it soon got accustomed to the labour, and then it ceased to ache, and grew daily stronger. Mr Herriott paid him his eightpence every night, and let him sleep in the shed; but he took little more notice of him, for he looked upon it as pretty certain that he would follow the same course as George Macmahon had done, and disappear; and he was justified in thinking so, for he had put several beggar boys to the same proof, and not one of them had held out above a couple of days. However, when a week had elapsed, and John Reid was still hammering away as hard as ever, he began to think better of him—spoke to him encouragingly as he passed, showed him how to do his work with the greatest ease to himself, and occasionally sent him out a slice of bread and meat from his own kitchen. In short, John Reid grew into favour, and Mr Herriott began to think of putting him into some employment more fit for him than breaking stones, which he was scarcely strong enough to do yet, with advantage to himself or his employer. He therefore took him off the road, and set him to remove some earth where they wanted to make a drain; and when this was done, he was sent amongst the carters, to help to load the carts and learn how to manage the horses. Thus, John got on from one thing to another, till he found the way to make himself really useful; and as he always did whatever was given him to do to the best of his abilities, his services were soon in general request among the men; and John's place became no sinecure. He worked hard all day, but then his wages were raised to six shillings a-week—he had enough to eat, and he could afford to pay for half a bed, which was a comfort he had very seldom enjoyed; and then he had the satisfaction of seeing that he was getting on, and gaining the confidence of his employers. It is true, he was often extremely tired after his day's work, yet he felt contented and happy, and rejoiced that he had not followed the example of George Macmahon; for he had earned a treasure that George knew nothing of—the treasure of hope—hope for the future—hope that he might some day have good clothes and a nice house, and live comfortably "like the gentlefolks," and be called *Sir*, as Mr Herriott was; for John thought it must be very pleasant to be respected and looked up to. And John was quite right—it was a very legitimate object of ambition; and it would be well if it were more generally entertained amongst the poor, because there is but one road to success, and that is by the way of industry and honesty. John felt this, and that was the reason he liked his work: he saw that it made him respectable, because it is respectable to be useful. Indeed, the being useful is the source of the only true respect mankind can ever enjoy; all the homage which is yielded to their other attributes—wealth, station, and power—unless these are beneficially exercised, that is, made useful, is only factitious; a sentiment compounded of fear, baseness, and self-interest.

Amongst the persons under Mr Herriott was a young man called Gale, who acted as clerk and bookkeeper. His connexions were in rather a superior condition of life; but having been himself imprudent, and reduced to distress, interest had been made with Mr Herriott's employers, who had appointed him to the situation he held. But adversity had not remedied the faults of his character; he was still too fond of company and convivial parties, and not unfrequently, for the sake of yielding to their seductions, neglected his business.

One Saturday, about three months after John Reid's first introduction to Mr Herriott, that gentleman had desired Gale to go to the town, which was some two miles distant, and bring back the money that would be wanted to pay the men's wages at night; but in the morning Gale forgot it, and in the afternoon there was some amusement in the way that made him dislike the expedition. So he looked about for some one to send in his place, and at last fixed upon John, because he could be the best spared, and was the least likely to be missed, his work being of such various kinds, that if he were not seen busy in one spot he would be supposed to be busy in another. So he dispatched John with a note, desiring the money might be given to the bearer; and although the agent thought *the bearer* rather an odd person to be intrusted with so large a sum, he did not consider himself justified in withholding the money; and consequently John received a bundle of bank-notes, which he buttoned carefully up in his pocket, and set off back again. On his way he fell in with Maggy Macmahon, George's mother. She was begging; and seeing that he looked decent, and no longer wore his beggar's rags, she told him that she supposed, now he was grown such a great man, he could afford to give a poor body a penny. John had some pence in his pocket; and more, perhaps, from a little pardonable vanity than from charity—for he knew Maggy to be a bad woman—he unbuttoned his pocket in order to comply with her request; but he had no sooner done so than she caught sight of the bank notes, and made a snatch at them, calling him, at the same time, a young thief, and asking him where he had stole all that money from. Failing, however, in her object, she tried to seize him by the collar, but John slipped through her fingers and took to his heels. She ran after him for some time, calling "Stop thief!"—but as there was nobody at hand to stop him, and as, being half intoxicated, she could not overtake him herself, she soon gave up the chase, and John arrived safe with his charge, and delivered it to Gale. But Maggy, who had heard from her own son where John was employed, was shrewd enough to guess that he had been sent to fetch the money to pay the week's wages, and that, probably, on the following or some other Saturday, he might be employed on the same errand; and as the road was not much frequented, it occurred to her, that, with a coadjutor, if not alone, she could hardly fail to obtain the booty.

It happened as Maggy had expected. John having been found a faithful messenger on the first occasion, the next time Gale's engagements made it inconvenient for him to go himself, he dispatched him again. John went, accordingly, and received the money; but remembering what had happened on his former expedition, and having the fear of Maggy before his eyes, he hid the money this time in his bosom, resolving to run all the way back, and not to answer her if she accosted him. But Maggy was too cunning for him; she had watched him up to the town; and not doubting the purpose of his errand, she waylaid him on his return, selecting, for her purpose, the most lonely part of the road, and taking her son George with her as a reinforcement. Thus, when the poor boy approached, she suddenly darted out from her concealment, and seizing him by the arm, told him that if he did not give her the money he was carrying she would kill him; but instead of doing what she desired, John cried out for help, and struggled hard to get away, and as he was an active boy, he did at last succeed in releasing himself from her grasp; but unfortunately, just as he was taking to his heels, his clothes having been loosened in the scuffle, the bundle of notes fell from his bosom to the ground, and were in an instant

picked up by George, who had been hitherto an inactive spectator of the conflict. As soon as Maggy saw that her object was attained, she made no further effort to detain John; but deaf to his intreaties to restore him the money, she, with her son, started off in an opposite direction, declaring, that if he attempted to follow her she would take his life. But John, too much alarmed at his loss to heed her threats, persisted in following her, hoping to meet some one to whom he could appeal for assistance; but Maggy obviated this danger by cutting across the fields, till at length, finding she could not get rid of him, she turned suddenly round, and with a savage blow felled him to the earth. By the time John had risen and wiped the blood from his face, Maggy and her son were far out of his reach, so there was nothing left for him but to pursue his way home, which he did with a heavy heart, greatly fearing that this misfortune would bring him much trouble, and perhaps be the occasion of his losing his situation.

As may be imagined, Gale, when he heard John's story, was extremely frightened, and, consequently, extremely angry, for he knew very well the fault was his own, and that his neglect of duty would now be disclosed to Mr Herriott; and as fear and anger are apt to render people very unjust, he refused to believe John's account of the matter, accusing him, in one breath, of carelessness, and in the next of dishonesty, threatening to turn him off and to have him up to the police; but as he could not do either of his own authority, he began by dragging him to Mr Herriott's office, and presenting him to that gentleman in the guise of a culprit brought up for chastisement. After reproving Gale severely for delegating a commission of such a nature to another, and especially to a boy who had so lately been taken off the streets, Mr Herriott turned to John to hear what he had to say for himself, not doubting that the temptation had been too strong for a lad brought up under circumstances so unfavourable, and that he was really guilty of appropriating the money. "But who has given you that blow on the face?" inquired he, on observing that John's nose had been bleeding, and that his mouth was swollen.

"Maggy Macmahon," said he, "because I ran after her to try to get the money back; and after she had knocked me down, she ran so fast that I could not overtake her; but if you'd be pleased to send to where she lives, perhaps you might catch her and get it yet."

This suggestion, whether honestly offered or not, Mr Herriott thought it right to follow; so, having hastily gathered an outline of the case from John, he dispatched him, with three of his most trusty workmen, to look after Maggy, giving the men strict orders not to let John escape, nor even to lose sight of him for a moment. But neither Maggy nor George was to be found at their lodgings, neither did they return there all night; so on the following day, the police having been put upon the alert, the expedition presented themselves before Mr Herriott with John still in their custody, but without any tidings of the money. The disappearance of the mother and son was in some degree a confirmation of the boy's story, and disposed Mr Herriott to listen with a more believing ear to what he said. Still it was possible that there might have been collusion amongst the parties, and that John's share of the booty was somewhere secured for him till he could accept it without danger; and then it occurred to Mr Herriott that very likely it had been given to his mother. The police were therefore desired to investigate the matter, and keep a close eye upon Jane Reid's proceedings; but, on inquiry, it turned out that Jane Reid was in the hospital, dying of a fever, and had been there for some days. So far the circumstances were favourable to John, as was also the discovery that he had brought the money safely on a former occasion; therefore, though still uncertain what to think, Mr Herriott did not turn him away, but merely kept him under strict *surveillance*, desiring the men he could trust to lose sight of him as little as possible. Thus, John went on as before, doing his duty as well as he could, but he was not so happy, because he felt he was suspected; and he saw little hopes of his justification, for Maggy and George returned no more to their lodging, nor did the police succeed in tracing them.

However, fortunately, when people intend to do right, the being watched is much to their advantage; and so it proved with John, for the more narrowly his conduct was observed, the more reason Mr Herriott saw to approve it; and as time advanced, and his acquaintance with John increased, he became thoroughly satisfied that the account the boy had given of the notes had been correct, and that he had actually been robbed of them. This conviction was accompanied by a great augmentation of interest for John, who he felt had been injured by the suspicion, and had thus had a supernumerary difficulty thrown in his upward path, and one that, in a less well-disposed boy, might have discouraged him altogether from well-doing; for, besides the mortification of being doubted, John had a good many crosses to bear from Gale, who resented the loss of the money as the cause of his own exposure, and took many opportunities of making the culprit feel the weight of his displeasure. But Mr Herriott's favour and good opinion were the road to fortune, and John seeing that, bore Gale's ill will with patience; and accordingly, in spite of it, he rose from one thing to another, till he found himself in a situation of trust and authority, being employed as clerk and overseer under Mr Herriott, with a salary of one hundred pounds a-year. This happened when John was twenty-five, exactly fifteen years after the time when he had found George breaking stones, and had asked Mr Herriott to let him have a hammer and give him a job.

John Reid was now a very happy young man; and he was the more happy from the contrast betwixt the present and the past, his comfortable and respectable situation being very unlike the prospect that had opened itself to him in his early years, when, a beggar born, he saw no hopes of ever being anything else; and nothing else would he ever have been, had he not had the wisdom to seize fortune by the forelock, and having once got hold of her, taken good care not to let her go again. In short, though John had never read Shakspeare, he acted as if he was aware that

> "There is a tide in the affairs of men,
> Which, taken at the flood, leads on to fortune."

The opportunity had offered—John had seized it—George had refused it—and these reflections led him often to think of George, and to wonder what was become of him; the more especially as he could not but remember that George was, in fact, the humble instrument of his own good fortune; for had he not seen him breaking the stones, it never would have occurred to him to make the application for himself.

It happened, on the occasion of some public rejoicing, that the men were allowed to leave work early, and some indulgences were given to permit of their spending the evening convivially together; but Mr Herriott particularly charged John to see that there was no drunkenness or disorder; and with this view, John put on his hat and cloak a little before midnight, in order to ascertain that the party had broken up, and that the men had retired peaceably to their beds. It was in the depth of winter, the weather was very cold, and the snow was lying three feet deep upon the ground. Having seen that the place where the men had supped was empty, and that all was apparently quiet in the cottages where they slept, Reid gladly turned towards his own dwelling, for the cold gusts of wind that seemed to blow through him, and the sharp sleet that drove against his face, brought out in bold relief the comforts of his tidily-furnished room, bright fire, and wholesome bed; but as he passed a temporary building which had been run up to defend some stores from the weather, he fancied he heard a groan. He listened, and it was repeated. "Ah!" thought he, "after all, I am afraid they have not been so steady as I had hoped; this is some drunken fellow, I suppose, paying the penalty of his excesses;" and he turned into the shed to see who it was. He had a lantern in his hand, and by its dim light he perceived a bundle of rags in one corner, whence the sounds proceeded, and on touching the object with his foot, a face was lifted up from the heap—a face on which death was imprinted, and which, with its hollow eyes, stared upon him with a meaningless stare, that showed that the senses were paralysed by the wretchedness to which the body was reduced. Seeing that this poor creature must die if he remained exposed to the cold of the night, John called up one of the workmen, and with his assistance removed him to a warmer situation; and there, after a little while, the heat of the stove, and a glass of warm brandy and water which they procured from Mr Herriott's house, restored the sufferer to consciousness. John then offered him something to eat; but he shook his head, and said, if it had come earlier it might have done him good, but that now he believed he was past eating. And so he was—and yet he was but a youth; but intemperance when he had money, and want and exposure to the inclemency of the weather when he had none, had done the work of years, and he had reached the last stage of his pilgrimage upon earth. In the morning, Mr Herriott, hearing of the circumstance, came to see him, and perceiving that death was fast approaching, he asked him where he came from, and if he had any friends. The man lifted up his heavy eyelids on hearing the interrogation; but when his eyes fell on Mr Herriott's features, a ray of intelligence and recognition shot from them. "Ah, sir!" said he, "I know you, but you have forgotten me."

"Did I ever see you before?" said Mr Herriott.

"You once gave me a job, sir, and said you'd be a friend to me," answered the miserable creature; "but I hadn't the sense to see what was for my own good. There was a boy, called John Reid" ——

"Ah!" said Mr Herriott, interrupting him, for he recognised at once who the stranger was, and saw the importance of seizing the opportunity to clear his friend John's character from the shadow of an imputation—"I remember you now, and John Reid, too; but John got into trouble about some money that he lost betwixt this and the town. Did you ever hear anything of it?"

"Did he lose his situation for it?" said the dying man, making an effort to raise himself on his elbow—"that was hard—very hard, for he couldn't help it; we took the money from him, I and my mother—but it did us no good; it was soon gone, and then she took to thieving to get more, and made me thieve too. It's too late now; but if I'd staid and broken the stones, it might have been different with me this day—but I was idle, and let the chance slip by me, and I never got another. God bless you, sir! I have lived a bad life—but let me have Christian burial, and the prayers of the church over my coffin." And thus died George Macmahon, the beggar, who refused to work, because he could get a shilling a-day and his food without the inconvenience of labour. But John Reid, who reflected that a beggar can never be anything but a beggar, and who thought it must be pleasant to be respected, and wear good clothes, and be called "Sir, like the gentlefolks," lived to see his honest ambition realised; and after passing his existence in peace, plenty, and contentment—having risen, step by step, till, at Mr Herriott's death, he was appointed to that gentleman's situation—died at a good old age, on a bed surrounded by his children and his grandchildren, to whom he left a comfortable provision, and the blessed inheritance of a good name.

BITS FROM THE BRITISH ASSOCIATION.

RELATION OF FACTORY LABOUR TO DISEASE AND MORTALITY.

THIS subject was treated in a paper read by Mr Noble, surgeon, Manchester, before the Statistical Section. The author began by adverting to the diversity of opinion which prevailed among medical authorities in reference to the influence of the factory system on the health of the operatives employed in it. Among the witnesses examined before the Parliamentary committee on factory labour, a few years ago, the metropolitan members of the medical profession had been almost unanimous in the opinion, that the factory system was highly prejudicial to health, and that it ought to be considered as the fruitful parent of consumption and scrofula. On that occasion, one witness, who, in the early part of his career, had had some experience in the centre of manufacturing industry, had made bold to assert that scrofulous diseases were immeasurably more abundant in Manchester than in London and other parts of the kingdom, and that the proportion in which that disease was developed could not be less than one in ten. On the other hand, there were many medical men who contended, that factory labour tended to fortify those engaged in it against scrofula and consumption. Amid such conflicting testimony, it was difficult to come to any satisfactory conclusion; but perhaps the best mode of arriving at the truth would be by leaving the opinions of men alone, and inquiring into the facts of the case. It was with this view, then, that he proposed to inquire to what extent the positive results obtained by the registrar-general confirm the idea, that consumption is more frequent in Manchester than in less densely-populated districts. But, before proceeding with the details of his proposed plan, he might just remark, with regard to the national system of registration, that, although defective in some respects, it would be a valuable auxiliary to our other means of investigation, especially on all questions relative to epidemic and contagious diseases, and especially in the prosecution of such inquiries as the present. The numerical statements he was about to submit were taken from the third and last published report of the registrar-general, and they applied exclusively to the year 1839. According to the census of 1831 (that of 1841 not having been obtained at the period of compiling the registrar's last reports), there were resident in Manchester and Salford 49,392 families; and the total deaths registered in 1839 amounted to 9223, of which 1454 are recorded as having been from consumption. This was, in round numbers, in the proportion of about one death annually from consumption to every 34 families; and in the total deaths from all causes, of three from consumption in every nineteen. Now, certainly, these facts furnished a very decided proof of the extensive prevalence of the disease in this district; and it might also seem to afford a decided confirmation of the doctrine, that factory employment tends to produce consumption. If we extended our inquiries to other parts of the kingdom, this supposition was still farther confirmed. In Essex, for example, with a population of 62,403 families, the deaths from consumption during the above year were less by 250 than in Manchester, although the population of Essex, in 1831, was 13,000 families above that of Manchester. If the inquiry were to rest here, the inevitable inference would be, that the statements as to the great prevalence of consumption in Manchester and its neighbourhood were strikingly confirmed by the facts mentioned. But it ought always to be kept in mind, that, independent of employment in factories, there were many influences at work in large towns which necessarily tended to shorten life. So far as the working classes were concerned, the confined atmosphere of their dwellings (many of them residing in cellars), the irregularity of their employment, and the variations in the rate of wages, all tended to increase the rate of mortality. But although the rate of mortality in Essex was greater than that of Manchester, it appeared from the returns that, compared with the number of deaths from all causes, the cases of consumption were actually fewer in this factory district than in agricultural Essex, being in the latter as 4 in every 21, and in the former but as 3 in 19. Again, if a comparison were drawn between Manchester and another agricultural district, the same result would be obtained. Taking a district which embraced Cambridgeshire, Huntingdonshire, and the southern part of Lincolnshire, comprising a population of 67,351 families, the deaths from all causes, in 1839, were 7306, and those from consumption 1308, or 1 death from the latter cause in every 5; showing, as in the case of Essex, a much lower rate of mortality than

that of these districts, but a greater proportion of deaths from pulmonary complaints. But there was another mode of ascertaining whether factory labour tended to foster consumption. Let them compare other large towns, where there were no factories, with Manchester, and see not only what the rate of mortality was, but also whether the number of deaths from consumption were not as great as they were in that chief seat of the factory system. For example, he would take the case of Liverpool and West Derby, a district resembling this in size and extent of population, but in which there was hardly any thing in the shape of manufactures. In 1831, the population of Liverpool and West Derby was 43,026 families, which was 6000 below that of Manchester and Salford at the same period, and yet the number of deaths registered for 1831 was 9181, which was only 42 less than the number of deaths in Manchester; while the deaths from consumption amounted to 1762, or 300 in excess of those in this town. In Birmingham, where there were no factories, the population in 1831 was 23,934 families, and in 1839, the registered deaths were 3639; those from consumption being 668, which was a rather smaller proportion than in Manchester. In London, the rate of mortality was much lower than in Manchester. In 1831, the metropolitan districts contained 373,209 families; the deaths were 45,441; those from consumption 7104, being in the proportion of two deaths annually for every 105 families, or in the proportion of three out of every nineteen deaths from all causes. From these numerical statements, which were of unquestionable authenticity, it was evident that Manchester and Salford were much more free from consumption than some other large towns. Thus far, then, they had looked in vain for evidence in favour of the assertion, that the factory system is favourable to the development of pulmonary consumption. But it might still be urged that, although the total number of deaths from consumption in Manchester were less than in the other towns he had named, yet that, of the fatal cases of pulmonary disease which do occur, an undue preponderance would be found among the factory population. With a view to ascertain what grounds there might be for this notion, he had, by permission of the superintendant-registrar of this district, gone over the books for this district, relating to the years 1838, 1839, and 1840. Believing that three years would form a fair average, he had taken the death-books of the township of Manchester for that period, and selected therefrom the age and stated occupation of all persons registered as having died of consumption, pthisis, or decline, between the ages of fifteen and forty. He had selected the township of Manchester, to the exclusion of Ardwicke, Hulme, and Chorlton-upon-Medlock, because he thought it contained a fair proportion of the factory population, and might therefore be considered a tolerably just type of the whole. He had limited the inquiry to those persons between fifteen and forty, because he considered it likely that, if occupation of any kind shortened life by inducing consumption, the affection would in most cases be developed, and would terminate fatally, within those limits; and because, in omitting from calculations the cases marked consumption or decline below fifteen and above forty, he was most likely to embrace the largest average of real cases of consumption. He found, then, that in the three years he had named, the township of Manchester, with a population of about 160,000 souls, and with an average of 6000 deaths annually, there were 1141 registered deaths from consumption; and, as nearly as could be ascertained, 174 of these were of persons working in factories, or somewhat less than one-sixth of the whole.

It might still be said, however, that factory labour prematurely exhausted the vital energies, and gave rise to an unusually early mortality from various chronic diseases. But if such were the fact, they surely expect to find such early mortality manifested in the cases registered as consumption. Anxious to see how far this was the case, he had classified the ages of the 1141 deaths from consumption in the township of Manchester, and the result was as follows:—

AGES.	DEATHS.
15 and under 20,	195
20 .. 25,	243
25 .. 30,	260
30 .. 35,	223
35 .. 40,	220

Now, on comparing these numbers with data of a similar nature regarding other towns, he found a most remarkable coincidence. Take, for example, the table which Sir James Clarke had given, in his work on tubercular pthisis, of the proportion, at different ages above 15, of 1000 deaths from pulmonary consumption, and it would be found to approach very closely to that he had given. In a table compiled from the mortality returns of Berlin, Chester, Carlisle, Paris, Edinburgh, Nottingham, and Philadelphia, that writer had shown that the deaths at different ages were in the following proportions:—

AGES.	DEATHS.
15 and under 20,	99 in every 1000
20 .. 30,	285 .. ..
30 .. 40,	248 .. ..

It would be seen, therefore, by comparing these numbers with those in the preceding table, that they bore very nearly the same relation to each other in both cases; from which it might fairly be concluded, that the population of Manchester is not at all more liable to the early invasion of this malady than that of other places. The general conclusion from all these facts was, that manufacturing habits do not exert any unusual influence in the production or premature development of pulmonary consumption, seeing that the vital statistics of this metropolis of the cotton manufacture, so far as they have been analysed and compared with similar data from other towns, exhibit no preponderance of deaths from that cause, but, on the contrary, a smaller rate of mortality, compared with the number of deaths from other causes, than was to be found in the rural districts. In conclusion, Mr Noble remarked, that he was far from entertaining the opinion which some did, that factory labour was protective from scrofulous diseases, and conducive to general good health. On the contrary, he believed that it was most prejudicial to sound health; but at the same time he felt satisfied that in this respect it differed very little, if at all, from most other occupations at which the great mass of the working population in towns were obliged to labour for their livelihood.

BIOGRAPHIC SKETCHES.

THE COUNT DE BUFFON.

George Louis Leclerc Buffon, the most popular writer upon natural history, perhaps, of any age or country, was born at Montbard, in the department of Cote-D'Or, within the ancient province of Burgundy, on the 7th September 1707. His father was a counsellor of parliament in that district, and possessed a handsome fortune, enabling him to give his son the advantage of a very careful and liberal education. Dijon was the scene of young Buffon's primary studies, which speedily took the direction of science and natural history, although his father was desirous that he should train himself for the legal profession. It is said that an intimacy formed at this early period with a young English nobleman, Lord Kingston, and his tutor, a very accomplished person, had no slight effect in turning the attention of Buffon to scientific pursuits. It was arranged that he should travel with these associates, and accordingly he passed through France and Italy in their company. During this journey, ere he had quite attained his majority, he succeeded, by the death of his mother, to a large fortune, estimated by some biographers at twelve thousand pounds sterling annually. Thus handsomely provided with means, he within a few succeeding years settled down into that continuous course of study, mingled with elegant enjoyment, in which he persisted to the close of his life. His time was chiefly spent at his pleasant retreat at Montbard, and partly, also, amid the accomplished and scientific society of Paris.

Before he became known in the literary world, Buffon had visited England, and it was in some measure with the view of perfecting himself in the language of that country that he undertook those tasks which first brought his name before the public. He translated and published the "Vegetable Statics" of Hale, and also the "Fluxions" of Newton, works which sufficiently indicate the character of his favourite studies. The able prefaces attached to these versions gained for him considerable reputation, and he soon augmented it by original papers read before the Academy of Sciences, of which he was elected a member in 1733. Mathematics, physics, and rural economics, formed the subjects of these various essays; and one of them, at least, attracted general if not universal attention. The object of Buffon, in the case in question, was to determine the possibility of the feat ascribed to Archimedes at the siege of Syracuse. Historians have related of that philosopher, that, by means of powerful reflecting mirrors, he set fire to the hostile and besieging ships "at the distance of a bowshot." After many preparatory experiments, Buffon constructed a mirror, formed of 168 pieces of silvered glass, each six inches square, and by the combined action of ninety-eight of these divisions (which could be used singly or collectively) he set fire to a tarred and sulphured plank at the distance of 126 feet, while the sun's rays were ordinarily powerful. A plank covered with wool was fired at 138 feet with 112 mirrors; chips of sulphured and charcoaled wood were ignited at 250 feet by 154 mirrors in two and a-half minutes; and 128 mirrors set fire to a tarred plank at 150 feet almost instantaneously. Many similar experiments were performed by Buffon, and they may be fairly held to have determined for ever the perfect possibility of the combustion of the Roman ships by Archimedes.

These inquiries show that Buffon would unquestionably have attained to a high rank in almost any branch of physical science which it might have been his choice to pursue. But his talents and time were destined to be absorbed by other studies. His friend Dufay, Intendant of the Royal Gardens and Cabinet, chanced to be seized with a mortal illness in the midst of zealous schemes for the furtherance of his peculiar science, and wrote from his bed to the minister, pointing out Buffon as the man best qualified to take his place. In consequence, the latter, in the year 1739, when only thirty-two, was installed in the vacated office.

A man of inferior genius might have been startled at the thought, if, indeed, he ever conceived it, of reducing to order the immense quantity of materials which had been accumulated from time to time in relation to natural science, and which stood, when they came before the new intendant, in the most chaotic shape—a mass valuable, indeed, in parts, but, as a whole, rude, indigested, without form and void. Buffon, however, did not shrink from the prospect before him. Ere long, he had conceived the plan of a great systematic work, embracing the history of every branch of animal nature, and he entered with ardour on its execution. At the same time, he saw the necessity, with an end so vast in view, of obtaining the aid of men who were competent to afford it, and who might supply deficiencies of which he himself was conscious. The most valuable assistant thus engaged by him was Daubenton, to whose indefatigable industry he owed all, or nearly all, the minute anatomical researches, drawings, and preparations, upon which his own toils were based. The comprehensive and ingenious theories, the attractive pictures of animal habits, the brilliant descriptions, the comparisons and classifications which permanently illuminated and popularised this most interesting branch of human knowledge—all these things flowed from the genius of Buffon himself. Ten years passed away, subsequently to 1739, ere he and his colleague were prepared to enter on their view of natural history, which began with quadrupeds, though this was preceded by a "Theory of the Earth" from the pen of Buffon. The latter composition is ingenious and eloquent, but its hypotheses have been overthrown by later discoveries in geology. Betwixt 1749 and 1769 fifteen large volumes appeared, amply working out the great schemes of the master-writer, and embracing accounts of the entire animal creation. Supplements, several in number, followed in succession, each adding new facts to some department or other of the previous whole.

Buffon had high and peculiar merit in devoting his lifetime, as he did, to science. He possessed a noble and commanding person, and a handsome fortune—ready inlets to all the gaieties of luxurious society. In addition to these seductive advantages, he was naturally fond of finery and display, and of an indolent temperament. Vanity was also shown to be one of his foibles, by his liking for reading his compositions to all around him. Yet during the greater proportion of his mature years, with all these weaknesses, he spent not less than fourteen hours a-day in study. He himself, when asked in his advanced years how he had contrived to do so much, replied, "Have I not passed fifty years at my desk?" Nor were these habits of application easily acquired. It is related that, distrustful of himself in his early days, he was compelled to order, and even to bribe, his servant to *force* him from bed at a certain hour, in spite of all orders and intreaties which might be weakly given at the time to the contrary—a proceeding which reminds one of the story of Ulysses, when he tied himself to the mast to listen to the Sirens, and commanded his men to disregard all his calls on them to stop. When he had settled into studious habits, he regulated his time in the following manner:—"After he was dressed, he dictated letters, and overlooked his domestic affairs; and at six o'clock he commenced his studies at the pavilion called the Tower of St Louis. This pavilion was situated at the extremity of the garden, about a furlong from the house; and the only furniture which it contained was a large wooden secretary and an arm-chair. No pictures relieved the naked appearance of the apartment, or distracted the thoughts of the learned possessor. The entrance was by green folding-doors; the walls were painted green, and the interior had the appearance of a chapel, on account of the elevation of the roof. Within this was another cabinet, where Buffon resided the greater part of the year, on account of the coldness of the other apartment, and where he composed the greater number of his works. It was a small square building, situated on the side of a terrace, and was ornamented with drawings of birds and beasts. Prince Henry of Prussia called it the cradle of natural history; and Rousseau, before he entered it, used to fall on his knees and kiss the threshold. At nine o'clock, Buffon usually took an hour's rest; and his breakfast, which consisted of a piece of bread and two glasses of wine, was brought to the pavilion. When he had written two hours after breakfast, he returned to the house. At dinner he spent a considerable portion of time, and indulged in all the gaieties and trifles which occurred at table. After dinner he slept an hour in his room, took a solitary walk, and during the rest of the evening he either conversed with his family or

guests, or sat at his desk examining the papers which were submitted to his judgment. At nine o'clock he went to bed, to prepare himself for the same routine of judgment and pleasure. In this manner were spent no fewer than fifty years of his life."

It would be a piece of presumption to make any critical observations, at this time of day, on the great work which thus occupied the existence of Buffon, and which ever has been one of the most popular works in the range of literature, being written in a most attractive and eloquent style, and correct in a vast number of its general facts and descriptions. To this work he added one on "Minerals," and some smaller treatises. The author of these obtained high and deserved honours from his king and country. In 1771, Louis XIV. erected his estate into a Compté, and, accordingly, he is best known by the title of Count. Buffon's private happiness was also secured, and his fortunes augmented, by his marriage, in 1752, with Mademoiselle Saint Belin. The fruit of this union was one son, who was unfortunate enough, it may be here mentioned, to fall a victim to the popular fury in the days of the Revolution.

The Count de Buffon lived to an advanced age, but his latter years were rendered painful by the malady of the stone. He nevertheless persisted in his studies, and refused to submit to an operation, though urged to it on all hands. The consequence of this imprudent obstinacy was, that, after eight years of severe torture, he sank under the complaint, on the 16th of April 1788, in his eighty-first year. Fifty small stones were found in his body on a posthumous examination. He was buried at Montbard, and twenty thousand persons, including the most distinguished men of France of the time, assembled to witness the ceremony, and do honour to his memory.

Alas, for human weakness! Of these twenty thousand spectators it would be curious to know how many were present within two years afterwards, when, through the popular hatred to all that savoured of nobility, the coffin of the naturalist was torn from its resting-place, and his monument razed to the ground!

This sketch may be fitly closed by a description of the house of Buffon from the pen of Miss Costello, who recently visited the place, in her pilgrimage to Auvergne from Picardy:—

"All the valley, and all up the steep coteaux, is cultivated chiefly with vines, which love a rocky soil. Masses of grey rock appear now and then amidst the green, and give a solemn aspect to the landscape. On an enormous block of this stone was built, in ages remote and mysterious, a stupendous castle frowning on the very summit of the mountain, and commanding all the country around. It might be of Roman construction originally, as is recorded, and have served as a retreat to the feudal lords of the troublous times which succeeded. St Louis might have dwelt there, for his name is given to one of the towers; at all events, there are walls enough, tall, strong, and thick, to build a town, if it were possible to dislodge their masses from the earth. Buffon found this treasure on his estate, and resolved to improve the happy accident, at the same time desiring to exercise his benevolence, and benefit the industrious poor around him. Hundreds of labourers were employed by him to arrange the grounds below the fine ruins into terraces and platforms; and under his eye, and directed by his taste, rose magnificent alleys, smiling gardens, secluded bowers, and open walks; avenues of larches, sycamores, acacias, ash, beech, and lime, spread far over the space; the rugged mountain was transformed into an elegant series of promenades adorned with statues, vases, and all that a pure and classic taste could imagine. The tottering walls of the antique towers were repaired, the rubbish of years cleared away, and from stage to stage of La Grosse Tour de l'Aubespin the fine proportions of its beautiful *salles* brought forth; its windows relieved from these obstructions, and allowed to afford the magnificent views which they could present on all sides; its winding stairs renewed and made safe, and the whole fabric restored in all its original grandeur; the ruined walls planed and levelled where necessary; several of those most adapted were covered in, and chambers formed within them, without a stone being displaced or any change of form effected—the perfect groined roofs still asserting their antiquity, and the thick walls telling the tale of their age. Far beneath, at the last descent of his terraces, appears the fine habitation in which the creator of all these wonders resided, and where he received and entertained his numerous friends and guests; but it was not here that his valuable studies were carried on. In the most secluded part of his domain he chose an isolated tower, which he had fitted up with every precaution to exclude noise—double windows and thick doors. Here, surrounded by his books, and free from interruption, the great philosopher of nature meditated, casting his eyes round on a peaceful and silent scene, and allowing his mind full scope. The principal part of his works were written in this retreat, and it would seem to be still held as sacred, few persons venturing to penetrate into the interior, being content to be told, 'Here the great Buffon passed his hours in study,' as they look upwards and observe the walls of the pavilion. It is extremely to be regretted that this relic is in a manner neglected. It is true that the windows have within a few years been repaired, but nothing more has been done; and the opportunity of regaining the *fauteuil* and desk, which were formerly used by Buffon, was allowed to escape. Nothing but bare walls remain; and gloomy and sad looks the old tower, peeping out from the garlands of a magnificent species of small-leaved ivy which almost envelop it."

LEIGH HUNT'S NEW POEM.

As the reverent homage which we pay to the Spensers and Miltons of our early literature does not preclude us from bestowing a lighter yet equally sincere tribute of praise upon its Herricks and Carews, so, in like manner, our admiration for the transcendant luminaries of modern song should not prevent us from heartily acknowledging our obligations to those contemporary poets who stand to them in a similar relation. Leigh Hunt is one who has such claims upon us. Though not to be ranked with the Byrons and Wordsworths, he is not the less a true poet, and has produced things which the world will not readily allow to perish. As a distinguished critic remarked of him, he has endeavoured to combine the characteristics of our old and modern schools of poetry, following the former in painting freely from the *eye*, and, like the latter, accompanying his pictures with an expression of the congenial emotions of the *mind*, with which external objects are or may be associated. Hence, while full of freshness and liveliness, the poems of Mr Hunt are also marked by a prevailing cast of simple and natural reflectiveness. He is, moreover, a writer of no slight degree of originality, often catching a subject in new lights, and, by minute touches, giving the stamp of fidelity to his portraitures. His close attention to nature has, indeed, been indirectly the source of his chief faults, since he seems unluckily to forget that London nature is not universal nature, and through his very faithfulness to *local* truth, both as regards modes of language and of thought, has fallen into vulgarisms which materially deface the beauty of his compositions.

These general remarks have arisen from the publication of a new poem by Mr Hunt, entitled "The Palfrey."* This tale in verse, we are told, is a variation, with additions of the writer's invention, of one of the old French narrative poems that preceded the time of Chaucer. The piece is a short light thing of little pretension, brisk and airy in matter and diction, and marked by many of the author's wonted characteristics, beauties as well as defects. An old knight, Sir Guy de Paul (the story says), lived at Kensington in the days of the first Edward; and with him lived one fair daughter, "the which he loved passing well," though he also loved his lands and his money bags to a degree that jarred with her comforts. She was beloved by a brave young knight, Sir William de la Barre, who was almost wholly dependent for his chance of wealth upon an old uncle, Sir Grey. "Go and bid Sir Grey come and satisfy me about the destination of his means," said the father to the lover, "and, if all is as it should be, I may give you my daughter." So, mounted upon his nephew's *Palfrey*, Sir Grey goes by persuasion to the mansion of Sir Guy, there falls in love himself with sweet Anne de Paul, and obtains her father's leave to bear away the reluctant damosel to his own halls to be wed. For safety, the aged and jealous wooer takes a number of old men with him on this journey, choosing night, too, as the fitting time for it; and so it falls out that Sir Guy,

> "on a night, when all things round,
> Save the trees and the moon, were sleeping sound,
> From his casement in shadow beholds his child,
> Bent in her weeping, yet alway mild,
> The fairest thing in the moon's fair ray,
> Borne like some bundle of theft away;
> Borne by a horde of old thieves away,
> The guests and the guards of false Sir Grey.
>
> She pray'd, but she spake out aloud no word;
> She wept, but no breath of self-pity was heard.
> Her woe was a sight for no dotards to see;
> And yet not bereft of all balm was she;
> One balm there was left her, one strange but rare,
> Nay, one in the shape of a very despair—
> To wit, the palfrey that wont to bear
> The knight De la Barre on his daily way
> To her, and love, and false Sir Grey.
> Him it had borne, her now it bore;
> And weeping sweet, though more and more,
> And praying for its master's bliss,
> (Oh! no true love will scoff at this),
> She stoop'd, and gave its neck a kiss."

The foolish old knight Sir Grey, then, his young bride-elect, and his grey-beard attendants, are on their way; and

> "The Palfrey goes, the Palfrey goes,
> Merrily still the Palfrey goes;
> He goes a path he never chose,
> Yet still full well the Palfrey goes."

Meanwhile, let us turn, with the third canto of the tale, to Sir William de la Barre, who, on the evening of that same journey, unconscious of his uncle's changed and selfish purposes, sat in his own poor home of Hendon Hall, entranced in dreams of joy.

> "For he had heard of rare delights
> Between those two old feasting knights,
> And of a pillion, new and fair,
> Ordain'd to go some road as rare;
> With whom? For what sweet rider's art?
> Whose, but the dancer's at his heart,
> The light, the bright, yet balmy she,
> And who shall fetch her home but he?
> Who else be summon'd speedily,
> By the kind uncle full of glee,
> To fetch away that ecstasy?
> So, ever since that news, *his ear*,
> *Listening with a lofty fear*,
> *Lest it catch one sound too late*,
> *Stood open like a palace gate*,
> *That waits the bride of some great king*,
> *Heard with her trumpets travelling.*"

The close of this seems to us very musical, and contains a beautiful similitude. The young knight of whom it speaks, however, is disturbed amid his delusive dreams by a letter from Anne's father, announcing that the young lady is about to be wedded to his own uncle, and with her full consent! The poor young knight is thrown into an agony of shifting passion, and remains so till midnight, when he hears

> "A tinkle of the house's bell;
> What news can midnight have to tell?"

Ah! little dreams he at first of the truth. The grey-beard band, who were that night engaged in carrying off the fair Anne de Paul, had, ere they started, taken something comfortable to ward off the night chills; and one by one, Sir Grey and all, they had sunk into a drowsiness, poetically said to be

> "composed of spices fine,
> Supper, fresh air, and old mull'd wine."

Anne, also, becomes soporose; but not so her Palfrey. The thoughtful animal keeps wide awake to catch the turning that led, not to Sir Grey's, but to the stalls of his true master, Sir William de la Barre. That turning he finds, and entering it, alone, and unnoticed by the sleepers,

> "Goes neither to the right nor left,
> But straight as honesty from theft,
> Straight as the dainty to the tooth,
> Straight as his lady's love and truth,
> Straight for the point, the best of all,
> Sir William's arms and Hendon Hall."

Yes, the fair Anne herself it was who, borne by the wise and wilful Palfrey, pulled the midnight bell, and brought her lover to his gate, almost to die of joy at the sight of his visitant. And then, for one sweet hour, did they devour

> "Each other's questions, answers, eyes,
> Nor ever for divine surprise
> Could take a proper breath, much less
> The supper brought in hastiness
> By the glad little gaping page;
> While rose, meantime, his mother sage
> To wait upon the lady sweet,
> And snore discreetly on the seat
> In the window of the room,
> Whence gleam'd her night-cap through the gloom.
> Then parted they to lie awake
> For transport, spite of all heartache:
> For heaven 's in any roof that covers,
> Any one same night, two lovers.
> They may be divided still;
> They may want, in all but will;
> But they know that each is there,
> Each just parted, each in prayer;
> Each more close, because apart,
> And every thought clasp'd heart to heart."

The morrow comes, and then, since

> "*Good must seem good as well as be;*
> And lest a spot should stain his flower,
> For blushing in a brideless bower,
> Sir William with the lark must rise,
> And bear—but whither bear?—his prize."

To the court they must go, and appeal to the king and queen; and at this very time, happily,

> "The bells in many a giddy ring
> *Run down the wind* to meet the king,
> Who comes to feast, for service done,
> With Earl De Vere at Kensington."

The fair Anne is accordingly placed under the charge of Sir William's aunt, an attendant on the queen; and the majesties of England are soon made aware of the state of things. Of course, the whole now ends happily, as it should do; but we must content ourselves with saying so, and leave our readers to discover for themselves the merry device by which the king caused old Sir Grey, with his sleepy grey-beards, to become a jeer to the court, and Sir Guy to feel shame at his intended barterment of his daughter's hand for gold. After the scene,

> "With princely laughter rose the king,
> Rose all, the laughter echoing,
> Rose the proud wassail, rose the shout
> By the trumpets long stretch'd out;
> You would have thought that roof and all
> Rose in that heart-lifted hall.
> On their knees are two alone;
> The Palfrey and the barb have gone:
> And then arose those two beside,
> And the music from its pride
> Falls into a beauteous prayer,
> Like an angel quitting air;
> And the king and his soft queen
> Smile upon those two serene,
> Whom the priest, accosting bland,
> Puts, full willing, hand in hand.
> Ah! scarcely even king and queen
> Did they then perceive, I ween;
> Nor well to after-memory call
> How they went from out that hall."

* The Palfrey; a Love Story of Old Times. By Leigh Hunt. London: How and Parsons. 1842.

Of course, our extracts give but an imperfect view of this lively little piece, and we can but recommend our readers to turn to it for themselves. It is a production, as has been said, of no great pretensions, but pleasing and healthy-toned. The author has inscribed it, in some rather quaint lines, to the queen.

A QUEER CASE FOR THE LAW.

In 1838, M. le Baron de Cormann, an opulent German noble, inhabited the chateau of his ancestors, situated in the environs of Weïma. An excellent sportsman, and a redoubted smoker, the baron was at the same time one of the ugliest mortals Germany ever produced. Notwithstanding this circumstance, he was an admirer of beauty in others, and conceived a lively passion for Mademoiselle de Reischberg, daughter of a neighbouring castellane, whose antique domicile constituted nearly his whole property. A formal demand of the lady's hand was made by the baron, and the father, delighted with the prospect of such a match, hastened to give the suitor an assurance of his assent and best wishes. It was not so, however, with the young lady, who, herself endowed with extraordinary charms, could not endure the looks of the baron, and had, besides, long ago given away her heart to one of her cousins, a handsome cavalier, in contrast with whom the baron made a very sorry figure. On this account the assiduities of the latter, and the commands of the father, produced no effect. Mademoiselle de Reischberg conclusively declared that she would never give her hand to any man so thoroughly ugly as the Baron de Cormann.

One evening she was tempted, by new intreaties on the part of the suitor, to repeat the preceding declaration even more energetically than before. The downcast baron afterwards wended his way home. He sat down by his blazing fire, called for a pipe and ale; and, betwixt the curling whiffs from his only source of consolation, he exclaimed passionately—"I would give myself to the Old One himself to be as good-looking as that confounded cousin!" In his energy the baron—who, it will soon be pretty evident, was something of a simpleton—spoke aloud; indeed, he almost roared out the words. After the ejaculation, he smoked on vigorously, every blast-like puff giving indication of the storm within. How long he sat absorbed in this occupation, it is impossible for us to say; but certain it is, that when he laid down the pipe, and the fumes around slowly floated away, he saw before him, to his great surprise, an odd-looking personage, but black all over, in countenance and clothes. "You have been heard," said this personage; "sign this paper, and by to-morrow morning you shall be beautiful in the eyes of all the world, though unchanged in your own."

Stupified—almost out of his senses—M. de Cormann sat staring without motion. "Sign!" repeated the figure; "I am never invoked in vain, and you shall find my words to hold good!" The thought of Mademoiselle de Reischberg crossed the baron's brain. Great was the temptation. He took the pen, and again hesitated, being in a state of unspeakable confusion of mind. Then, as if determined not to trust himself with reflection, he hurriedly signed the paper. The stranger lifted it, bowed, and disappeared.

After this proceeding, which had taken place so rapidly that the baron had had scarcely time for connected thought, he sat in silent dreamy stupor through several long hours. With strange feelings he retired to bed, half afraid of the past, and half eager for the dawn, that he might prove the reality of the promised metamorphosis. Morning broke, and the baron arose. He dressed himself, and perceived no change in his appearance; but he had no sooner descended the staircase than the reality of a change was made manifest. Two servants stood in waiting, and the instant that they cast eyes on their master, they started back in great surprise. "Gracious powers! how much my lord is improved in looks! what a noble figure! how beautiful a countenance!" The baron's heart beat thick with exultation. He went out for further proof, bending his course to the mansion of M. de Reischberg, which was close to his own. Two men met him, and they, also, started to behold him. "How noble is my lord's figure!" cried one. "What a charming countenance!" cried the other; "surely he is much altered!"

These and such like ejaculations confirmed the baron in his impression of the reality of the metamorphosis; and he proceeded, without delay, to the house of M. de Reischberg. Here the crowning stroke was given to his triumph. Mademoiselle de Reischberg appeared equally surprised and enchanted with his form and looks. She seemingly could not conceal or restrain her admiration, and the handsome cousin appeared to be driven out of her thoughts at once by the new and irresistible charms of his rival. Striking while the iron was hot, the baron intreated her to reward his long devotion by consenting to be his. The lady hesitated—the cousin seemed to pass, for a last time, across her thoughts; but the baron pressed his request, and the lady gave her consent.

In passing homewards on that happy day, the baron received additional though superfluous proofs of the change in his looks, from the remarks of various persons who came in his way. When before his own fire, a pipe and ale were again called for to heighten the delightful cast of the baron's ruminations. Long he smoked, gazing on the blaze; but at length he laid down the pipe. Then did he first become sensible of a startling fact. His sable visiter of the preceding evening was again before him. "If you fulfil the intention you now entertain of leading Mademoiselle de Reischberg to the altar," said the stranger solemnly, "*you will die on its steps.*" As he spoke he disappeared.

The Baron de Cormann lay for a long time in a swoon after this fearful announcement. When he regained his senses, and could reflect on what had passed, great was his vexation, and greater his terrors. He could not conceal from himself the fact, that, since his visiter had been able to fulfil one promise so effectually, the same being could not fail to fulfil with equal certainty the menace just made, or at least to foresee the future. He saw that the fiend, if fiend it were, had "paltered with him in a double sense," but the evil was irremediable. Preferring life to every other consideration, the baron, ere long, took a decisive resolution. He wrote to the Reischbergs, announcing his altered resolutions respecting marriage, and, in short, declining the honour of the young lady's hand. On the following morning he jumped into his carriage, and drove off for Paris, after leaving precise orders with an agent to sell his chateau and property at Weïma without delay.

It was in the end of 1838 that the Baron de Cormann reached Paris, where he took a handsome hotel in the Rue Dominique. A month or two after his settlement there, he was presented with an acceptance of his own for 120,000 francs, purporting to have been granted by him while in Germany, and a demand was made upon him for payment of the same. The holder of the acceptance, and the requester of payment, was the already-mentioned handsome cousin of Mademoiselle de Reischberg, now become her husband.

The baron was struck dumb by this demand. Never, in the course of his life, was he aware of having signed any such obligation either to the nominal holder of the one before him, or to any person else. Yet he could not deny that the handwriting of the presented bill was his own; it was certainly his signature. Nevertheless, in the consciousness that he really owed no such debt, he refused payment. Immediately afterwards, he went to consult an acute legal friend. After relating the circumstance to that gentleman, and repeating his confident assurance that he never signed, to his knowledge, the obligation in question, though unquestionably his signature was there, the lawyer asked if he never, while in Germany, signed any paper without knowing its contents? The baron thought for an instant, and blushed for his folly. The remembrance of his strange visitant came across his mind with all the attendant circumstances. He compelled himself to tell his legal friend the whole affair.

The acute lawyer saw through the mystery at once. The baron had been ugly at Weïma, he was ugly at Paris, and he had never been aught but ugly any where. The handsome cousin had so suborned his domestics as to acquire a knowledge of every movement, even of every word of the baron, in his own establishment; and being near the spot, perhaps in the house, on the evening of the baron's rash ejaculation respecting a change of personal appearance, he had taken advantage of the circumstance, when it was reported to him, to victimise de Cormann in a double and truly diabolical way. By the connivance of the treacherous servants, and one or two other persons, Mademoiselle de Reischberg included, the poor baron had been thoroughly imposed upon, and, in some respects, he was not undeserving of it, seeing that he credulously consented to attempt success in his suit by such means as those described. The conspirator of a cousin, it is probable, imagined that the baron would pay the sum rather than incur the ridicule of a full disclosure.

The affair, says our French authority, came to a trial, and a celebrated Parisian advocate was engaged for the baron, the note for 120,000 francs being lodged, in the interval, in the safe hands of Messrs Rothschild. We regret that we have heard nothing of the issue of the case, and can only hope that the law prevented the poor credulous baron from being ultimately tricked out of his money by the unscrupulous young lady and her cousin. The moral seems to be—never sign any document of whose purport you are not fully acquainted.

EXPECTATIONS FROM THE COPYRIGHT ACT.

The "Spectator" describes these as exaggerated. "Because," says he, "Milton got a small sum for his 'Paradise Lost,' and the demand for the work has gone on to increase from age to age, every scribbler whose book proves a failure dreams he can gain by a prolongation of the period of copyright. How many of the thousands of works annually published will be worth the expense of reprinting them a dozen years hence? Making allowance for the less numerous population of the country, the book-press worked as busily about the middle of last century as it does now. Cave's Magazine had a circulation of 30,000; the successive impressions of Richardson's novels were devoured with as much eagerness as those of the Waverley Novels in our days; ephemeral and dead-born publications jostled each other as they fell from the press, just as they do now. How many are now remembered? How many of these would be reprinted if the publishers had to pay a tribute to heirs of their authors for leave to print them? Robertson's histories, Roscoe's 'Lorenzo de Medici,' have been reprinted in cheap forms, and have not, as we are informed, indemnified the enterprising publishers. Yet the latter was one of the most popular books of its day, and the former are, to a certain extent, still standard works. It is only works of imagination that can by any chance maintain their popularity with successive ages. Every thinker in the department of history or of physical and moral science, if he be worth any thing, opens the way for others to go beyond him. The business of the mass of men is with results: a few curious inquirers may like to look back and trace the progress by which knowledge has come to be what it is, or a few men of leisure may have a taste for contemplating skilful investigation without reference to what it leads to; but by far the greater number care only for the knowledge they can turn to practical account: they seek for compendiums which contain this knowledge, and leave to the curious few to study and admire the profound thinkers who have contributed to their discovery. And even with regard to works of imagination, those which, like the works of Homer, Shakspeare, and Dante, are felt by all ages, are few—scarce one in a century; while of the inferior class, worthy of attention, yet not rising much above the average level, each age produces enough to amuse its idle hours, and prefers those who talk about things that interest it in the language with which it is familiar, to those who speak of out-of-date topics in an antiquated style. There is no doubt that the trade of literature is a poor one; but there is just as little doubt that, for the great mass of those who pursue it, an eternal copyright would not in the smallest degree mend the matter. And, on the other hand, it is questionable whether great geniuses need its assistance. Shakspeare turned his talents to account; so did Pope; and as for Sir Walter Scott, about whom such a rout is made, had he husbanded his earnings with the slightest degree of judgment, he would have died a wealthy man. Burns and others only suffered by the law of nature, to which all—the genius and the fool—must alike submit. And as for Wordsworth, if a man sets out by telling the public, 'I will not give you what you like, but what you ought to like,' this is magnanimous, doubtless, but it is somewhat unreasonable to ask at once for the reputation of the austere self-denying sage and the money reward of the courtier."

THE "IMMENSE CONCERN" MANIA.

It is a prevailing insanity among shopkeepers of the present day to be at the head of an immense concern, and it is a malady which, in almost every case, finishes with a fatal result, not only to the individual who is the immediate object of the complaint, but to those who may happen to be bitten in the interim. It generally seizes the proprietors of linen-drapers' shops, and, like the bite of the tarantula, sets them cutting the most extraordinary capers, in the course of which they start off with a most lively gallop, and conclude with a pas, not of the most graceful kind, in the Court of Bankruptcy. An immense concern generally begins in a single house, and the disease first develops itself into a strong itching to take the next door, which, when once accomplished, is soon followed by an eccentric resolution to add the words "and Co." to the name of the proprietor. The next stage is an eruption of large placards conveying incoherent hints about "giving away," "selling under prime cost," and other unaccountable acts of generosity which the patient professes to practice; while, by degrees, he grows bolder in the tone of his tickets, and sundry commodities are placed under the public eye, inscribed with mysterious allusions to "an alarming sacrifice." The breaking out upon the goods shortly flies to the windows themselves, which are soon covered with enormous posting bills, in which the words "Extensive Failure" are extremely conspicuous; and there is a desperate effort to arrest attention by thrusting goods almost into the street, with a printed invitation to the public to "Look at this," and a most uncalled-for allusion to the "distress of the Spitalfields weavers." The disease now becomes convulsive; enormous piles of drugget are deposited outside the shop, in bold defiance of the Paving Act; carpets dangle from the upper storeys; blankets float in the air, and pieces of calico flutter in the breeze; while straw bonnets are dashed recklessly into the window, with an intimation that there is a choice of 25,000 all at a price not even worth mentioning. Blocks are dressed up in cloaks to look like customers; dresses that have been lying in the wareroom since last year are labelled as "quite new, and just imported." Every thing is marked at an astounding moderate price; but, by some strange accident, there is not a ticket but what has slipped from one thing to another if any one wants to purchase the labelled article. After these very active symptoms, the disease comes to a termination; the immense concern dies a natural death, and the proprietor amuses the public by a series of candid confessions to the commissioner of bankruptcy, or gratifies a spirit of enterprise by "bolting" to America.—*Glasgow paper.*

PUBLIC HEALTH IN A TIME OF PRIVATION.

The following paragraph appeared early in June in the *Glasgow Courier*. If right in facts and inferences, it affords most important matter of reflection:—"It gives us much pleasure to learn that, notwithstanding the want of employment by the working-classes, and the almost unparalleled amount of destitution which has consequently prevailed for some time past amongst a certain portion of the community, the state of the public health was hardly ever in a more satisfactory condition than at present, since the city contained anything like the same extent of population. Such a state of things must be peculiarly gratifying, particularly when it is considered that we have all along been led to believe that the periodical destitution of a portion of the poorer classes was the principal cause which gave rise to typhus fever, &c., which, spreading from one class to another, not unfrequently became a general scourge. Strong evidence, however, is at present afforded that neither typhus fever nor any other contagious disease is necessarily a concomitant of great poverty amongst a portion of the community; and while we acknowledge the goodness of providence in thus alleviating and making less intolerable 'the ills

which flesh is heir to,' we think we can discover in surrounding circumstances the causes which have been in operation in producing the present very gratifying state of the public health. April, May, and June, up to this date, have been remarkable for the small number of patients either treated by the district surgeons or sent to the Royal Infirmary. Something of this may be attributed to the excellent weather which the country has enjoyed during that period; but we feel quite confident that it has been far more the result of the poor being supplied with a regular, though limited, amount of victuals from the soup kitchen and otherwise, and to the necessity which compelled many of them to abstain from the inordinate use of ardent spirits, than to any other cause whatever. When prosperity returns, therefore, and the working-classes generally are again placed in a condition to support themselves, we trust that the present experience will not be thrown away, and that more money will be spent by them on good wholesome food, and less on what causes so much misery, disease, and death."

PROTECTION OF LAND FROM STORMS.

[From the *Gardeners' Chronicle.*]

Few things are of greater importance to those who live in bleak situations, or on the coast, than to know in what way they may best break the force of the prevailing winds. Belts of wood are generally resorted to, and when they can be formed, they are the best kind of defence; but the difficulty is to obtain them. Many persons are to be found in these islands who, after incurring considerable expense in the attempt, have been obliged to abandon it as hopeless. In Mr Stephens's "Book of the Farm," of which we have on former occasions spoken as a most valuable work, full of interesting practical information, is an account of a method of protecting bleak situations effectually, which will certainly be interesting, and probably will be new to our readers; and which, by permission of the proprietors of that work, we have been able to introduce into our pages. The excellent remarks of the author render any addition on our part superfluous:—

"That a fence affords shelter," says Mr Stephens, "must be a fact cognisant to every one. Feel the warmth of a walled garden—the calm felt under the walls of even a ruin compared to the howling blast around—observe the forward grass, in early spring, on the south side of a hedge compared to that on its other side—and listen to the subdued tone of the wind under a shed to its boisterous noise heard in the open air. Sensibly felt as all these instances of shelter are, they are but isolated cases. In more extended spheres, cottages stand in a calm in the midst of a forest, come the wind from whatever quarter it may. Farm-steadings lie snug under the lee side of a hill. Whole farms are unaffected by wind when embayed amidst encircling hills; and be the shelter, therefore, great or small, the advantages derived from it are sensibly felt. As one instance of the benefits of shelter afforded by even a low wall to a park, from the cutting effects of the sea air, I give a sketch to show you its effects better than words can convey. The wall and the wood next it are of the same height, but a few yards only inwards; the wood rises to a considerable height, and this is effected by a very simple contrivance; namely, the peculiar form of the cope of the wall. It is raised like an isosceles triangle, by which the wind, when it beats against its side, is reflected upwards into the air at the same angle. Had the cope been flat, the blast would have cut off the tops of the trees in a horizontal direction. But without the wood such a form of coping would afford similar shelter. Suppose land exposed on the top of a high coast, where the wind generally sweeps along the surface of the ground, injuring every plant it blows against by a momentum acquired in passing over miles of ocean—were a wall built on the top of the crag, at such a distance from its brow, and of such a height, and with such an angle to its cope, as would deflect the wind upwards, it would cause the wind to have lost most of its momentum before it again reached the ground. Such a wall, or such a belt of wood, or such a plantation without a wall, if projected on a large scale, and planted near the top of a sloping precipice, or other rising ground, would shelter a large extent of country against the prevailing winds. Were such barriers placed in lines, in suitable places, across the country, not only its local but its general climate would be greatly ameliorated.

Instances are not wanting to show the usefulness of such barriers. Even within the experience of the present generation, shelter has been found to amend the climate and increase the crops of particular parts of the country. As instances of wall shelter, the garden of the Earl of Lauderdale at Dunbar, and the plantations, along the seaside, of the Earl of Wemyss at Gosford, both in East Lothian, afford good examples. In the latter instance a coped wall has afforded so perfect a shelter to the plantations, that, at the distance of from twenty to thirty yards, the forest trees are scarcely affected by the seabreeze, on ground which formerly produced nothing of higher growth than sweet-brier and whins. The garden of Mr Traill of Woodwick, at Kirkwall, Orkney, affords another remarkable instance of the benefits of wall-shelter. But the benefits derived from plantations are far more extensive and important, not only in affording shelter, but in improving poor land. 'Previous to the division of the common moor of Methven (in Perthshire) in 1793,' says Mr Thomas Bishop, 'the venerable Lord Lynedoch and Lord Methven had each secured their lower slopes of land adjoining the moor with belts of plantation. The year following I entered Lord Methven's service, and in 1798 planted about sixty acres of the higher moor ground, valued at two shillings per acre, for shelter to eighty or ninety acres set apart for cultivation, and let in three divisions to six individuals. The progress made in improving the land was very slow for the first fifteen years, but thereafter went on rapidly, being aided by the shelter derived from the growth of the plantations; and the whole has now become fair land, bearing annually crops of oats, barley, peas, potatoes, and turnips; and in spring, 1833, exactly forty years from the time of putting down the said plantation, I sold four acres of larch and fir (average growth) standing therein for L.220, which, with the value of reserved trees, and average amount per acre of thinnings sold previously, gave a return of L.67 per acre.' In some situations trees will afford better shelter than stone walls, the latter being most available near the sea side in warding off the blighting effects of the sea breeze. On the summit of Shotley Fell, sixteen miles west of Newcastle-upon-Tyne, Mr Burnet, of Shotley Bridge, enclosed 400 acres of moorland with high stone walls, and he cropped the ground in an easy manner for the soil. The land was thus kept in good heart; but the soil being very poor, stock advanced but little, and consequently the land would not have let for above sixpence an acre even under the best management, and after all that had been done for it; but the centre part of each field was then put within a plantation, and the improvement which followed was surprising."

RAILROAD TRANSPORTATION.

We copy the following from a New York newspaper:—"Three thousand wild pigeons, from Michigan, arrived in this city, on the 25th instant, alive, over the Western Railroad. One thousand five hundred bushels of wheat were last week bought in New York city, carried up the North River to Greenbush, and thence sent to Sutton, near Worcester, over the Western Railroad.

We understand that the Western Railroad are about preparing refrigeratory cars, in which fresh beef, pork, veal, poultry, pigeons, venison, wild game, and other fresh meat can, by a moderate quantity of ice, be kept in order in the heat of summer, and in which (in winter) they can be kept from freezing; thereby, in either case, adding much to the value of the article when carried to market.

These refrigerator cars will be used, for the like advantageous purpose, to carry eggs, butter, lard, fish, vegetables, cheese, lemons, oranges, strawberries, and all berries, and fruits, and roots—being a mode of transportation of great value for nice delicacies which bear a good price. We also learn that it is contemplated these refrigerator cars shall go with the passenger trains in twelve hours, through from Albany to Boston, and shall be placed between the tender and passenger cars, giving additional security to the passengers in case of accident. If our Michigan and Ohio friends will put in refrigeratory cars the fresh meat and the wild game they intend for this market, they can send their cars to Buffalo on the lakes; and from Buffalo to Greenbush, partly by railroad and partly by canal, or wholly by the Erie Canal. Then from Greenbush, it can come to Boston quickly and in perfect order, the moment the system now proposed is perfected. In like way, a chowder of fresh Massachusetts cod-fish will be obtained at Chicago.

It may be asked, 'What is a refrigerator car?' It is simply a common car, with a hole at the bottom, which you stop by a sponge, that sponge allowing the water to drop down, while it impedes the air coming up into the car. Then you have four inches of powdered charcoal on the sides, and top, and bottom of the car, compactly between the two boards, which form each of the sides, as well as the top and the bottom. In fact, it is only necessary to imitate the refrigerator, which is used in Boston, in families, and is sold by Kittridge and Blake. If it is said that it will be difficult to make so large a refrigerator as an eight-wheel car will be, we need only reply, that the ice-houses at Fresh Pond are, in fact, large refrigerators, and that some of them are large enough to contain 8000 tons of ice, and have kept ice from melting for a whole year, and longer too.

In sending a cargo of ice to Calcutta, we so arrange the hold of the ship as to make it virtually a large refrigerator; and we do this so efficiently, that, crossing the equator twice on her passage, and being for a long time in the warm water and under the burning sun between the tropics, she yet loses very little of her cargo. Barrels of apples, kept cool in this refrigerator, arrive at Calcutta from Boston in the most perfect order, and command a great price."

[This is all remarkably enterprising, and very wonderful; but one standing at this cool distance may be permitted to ask, Whether the thing is to be done with real or borrowed capital? The imprudence of our transatlantic brethren in plunging into all sorts of schemes of improvement, without first working for the money to carry them into execution, is causing them to be laughed at throughout Europe.]

CUNNING OF A LUNATIC.

A very laughable incident occurred at the lunatic asylum at Lancaster some years ago. A parish officer from the neighbourhood of Middleton took a lunatic to the asylum, pursuant to an order signed by two magistrates. As the man was respectably connected, a gig was hired for the purpose, and he was persuaded that it was merely an excursion of pleasure on which he was going. In the course of the journey, however, something occurred to arouse the suspicions of the lunatic with respect to his real destination; but he said nothing on the subject, made no resistance, and seemed to enjoy his jaunt. When they arrived at Lancaster, it was too late in the evening to proceed to the asylum, and they took up their quarters for the night at an inn. Very early in the morning the lunatic got up, and searched the pockets of the officer, where he found the magistrate's order for his own detention, which of course let him completely into the secret. With that cunning which madmen not unfrequently display, he made the best of his way to the asylum, saw one of the keepers, and told him that he had got a sad mad fellow down at Lancaster, whom he should bring up in the course of the day, adding, "He's a very queer fellow, and has got very odd ways. For instance, I should not wonder if he was to say I was the madman, and that he was bringing me; but you must take care of him, and not believe a word he says." The keeper of course promised compliance, and the lunatic walked back to the inn, where he found the overseer still fast asleep. He awoke him, and they sat down to breakfast together. "You're a very lazy fellow to be lying in bed all day. I have had a good long walk this morning." "Indeed," said the overseer; "I should like to have a walk myself after breakfast; perhaps you will go with me." The lunatic assented; and after breakfast they set out, the overseer leading the way towards the asylum, intending to deliver his charge; but it never occurred to him to examine whether his order was safe. When they got within sight of the asylum, the lunatic exclaimed, "What a fine house this is!" "Yes," said the overseer; "I should like to see the inside of it." "So should I," observed the lunatic. "Well," said the other, "I daresay that they will let us look through: however, I'll ask." They went to the door; the overseer rang the bell, and the keeper, whom the lunatic had previously seen, made his appearance with two or three assistants. The overseer then began to fumble in his pockets for the order, when the lunatic produced it and gave it to the keeper, saying, "This is the man I spoke to you about; you will take care of him, shave his head, and put a strait waistcoat upon him." The men immediately laid hands upon the poor overseer, who vociferated loudly that the other was the madman and he the keeper; but as this only seemed to confirm the story previously told by the lunatic, it did not at all tend to procure his liberation. He was taken away, and became so very obstreperous, that a strait waistcoat was speedily put upon him, and his head was shaved *secundum artem*. Meanwhile the lunatic walked deliberately back to the inn, paid the reckoning, and set out on his journey homeward. The good people were of course not a little surprised on finding the wrong man return: they were afraid that the lunatic in a fit of frenzy had murdered the overseer; and they asked him with great trepidation what he had done with ——? "Done with him," said the madman; "why, I left him at Lancaster Asylum raving mad;" which, indeed, was not very far from truth, for the wits of the poor overseer were well nigh overset by his unexpected detention and subsequent treatment. Farther inquiry was forthwith made, and it was ascertained that the man was actually in the asylum. A magistrate's order was procured for his liberation, and he returned home with a handkerchief tied round his head, in lieu of the covering which nature had bestowed upon it.—*Flowers of Anecdote.*

THE WEALTH OF ENGLAND.

It is a common error in this country (America) to imagine that the riches of England are derived from and dependent upon her commerce; and the influence of this great mistake is shown in the many wild suppositions that have been hazarded, touching the effects of our commercial and financial difficulties upon the financial and political condition of the wonderful little island. The truth is, that the merchants of England, with all their great capital and vast extent of operations, hold but a very small portion of the riches existing in that country; and this can be made apparent by a few simple considerations. Look at the squirearchy, for instance; the thousands and thousands of country gentlemen, with their comfortable incomes of three, or five, or ten thousand pounds per annum, derived exclusively from the soil, and the enormous fortunes of the nobility.

Estimate, if it can be estimated, the immense amount of treasure in the country, existing in the form of plate and jewels. Why, at a single dinner given in London, on the 18th June, gold and silver plate to the amount of a million and a half of dollars was exhibited at once, all the property of one individual—the Duke of Wellington. This celebrated personage could have relieved from all their difficulties all three of the great American houses which have been compelled to stop, simply by turning over to them his dishes and tureens, vases, and candelabra, without diminishing his income one farthing; and there are fifty ladies in London, any one of whom could have put Messrs Brown & Co. in ample funds for all emergencies, merely by making them a present of her diamonds.

Without taking the crown jewels into the account, it is no doubt susceptible of proof, that in London alone there are gold and silver plate and jewels to the amount of two hundred millions of dollars, and it must be remembered that mighty as London is, the wealth of the kingdom in wrought gold and silver is very far from being centred there. An immense quantity of it is scattered among the castles and country seats of the nobility, such as Alnwick Castle, Blenheim, Chatsworth, Belvoir, Woburn Abbey, Bowood, and a hundred others which we could name, and among the lovely mansions of the country gentlemen, with which the whole surface is dotted by thousands. Think of the libraries and galleries, the immense and almost priceless collections of pictures and statues, and costly works of art, in which no country in the world is richer. Why, the whole mercantile wealth of England is but an item of comparatively trifling magnitude. The non-payment of debt, if it were not paid, which, thank Heaven, it soon will be, so far from inflicting a mortal blow upon the prosperity of the kingdom, would never be felt or thought of, except as a handy theme for a sarcasm, now and then directed against republican honesty and honour. The fortune of the Duke of Bedford, or Northumberland, or Devonshire, would clear the whole of it, and nobody but his grace be a farthing the poorer. —*From a New York Paper.*

SELF-ESTEEM PIQUED.

Success seems to be that which forms the distinction between confidence and conceit. Nelson, when young, was piqued at not being noticed in a certain paragraph of the newspapers which detailed an action wherein he had assisted. "But never mind," said he, "I will one day have a gazette of my own."—*Lacon.*

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row.

Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

CHAMBERS'
EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 552. SATURDAY, AUGUST 27, 1842. PRICE 1½d.

KNOW BEFORE YOU SPEAK.

AMONGST the petty dishonesties of common life, there are some more hurtful, but perhaps none more paltry, than that of pretending to know where one is ignorant. It is a fault into which many not ill-meaning persons are drawn, from a false shame which would probably be checked if any immediate evil consequences seemed likely to flow from it. They dislike to appear at a loss, or defeated, or under a short-coming, about anything; and thus are tempted either to affect knowledge where they have it not, or in some way to allow it to be supposed that they are not ignorant. For example, some one adverts to a fact in science with which he is familiar. Perhaps it is brought forward for the instruction or entertainment of the rest—perhaps to show his own knowledge—perhaps only in the fair course of conversation: no matter how it may be in this respect—the point at present in question is the want of candour in the persons whom he is addressing, in hearing as if they understood that and all the related facts, putting on an intelligent look, assenting to the proposition as if convinced of its soundness, and perhaps even hazarding some remarks that may favour the supposition of their being as well informed on the subject as the first speaker. Or perhaps a passage of a classic or foreign author is quoted—pedantically or otherwise it matters not—what we have to remark is the unconscientiousness of the rest of the company, or of particular members of it, in letting the thing pass as an intelligible part of the discourse, and appearing to sanction its appositeness, when, in reality, they are either altogether ignorant of the language in which it is written, or have been unable to follow the sense of the passage with any degree of clearness. Another class of cases are those in which particular unconnected facts, such as are found in almanacs, chronological tables, and geographical dictionaries, are referred to, when too often there is an observable anxiety to speak or look as if we were not now, or had not recently been, ignorant of the special point under notice; even the mention of some distantly connected fact being felt as a protection against the supposition of entire ignorance—as, for instance, when the point in question is the name of the remarkable mountain in Ceylon, to state that you knew very intimately a cousin of the gentleman who wrote the last book about the island. All these are offences against good taste much within the range of that last and worst—the active and unprompted bluster of one who talks of what he does not understand. This grand offence is far beyond our hopes of correction; but we think that a few remarks on the comparatively negative instances of the error above described, may be attended with a good effect.

When any rational and well-meaning person feels himself tempted into such courses, let him only consider how absurd it is to suppose that there can be any real disgrace in being ignorant of any particular fact whatever. Science is a vast field—so is learning—insomuch that there can be no man in existence acquainted with the whole of either. The most eminent in both scientific knowledge and in learning know only a part, and are liable to be found ignorant of much. This is well known and universally acknowledged. When, therefore, any ordinary person is found unacquainted with some particular fact, or even with some entire science, or some whole language, there is no reason why he should be deemed a generally ignorant man. It may be presumed that, if he is ignorant of one thing, he is conversant with another, *as is the case with the most eminent students;* and thus he may pass very well, though openly acknowledging that on the point in question he is blank as a newborn babe. These considerations apply with particular force to the last of the above classes of cases. The knowledge is there of a kind which no rational person attempts to make himself master of. It is rather discreditable, in some little measure, to be too well read in such facts. And how well may a man fulfil his duties in the world, and how well informed may he be in what is useful and serviceable, although he does not know one fact in the topography of Ceylon. If these considerations fail, let us only reflect for a moment on the disgrace of being detected in an attempt to conceal ignorance. There is a story of Sheridan having once apparently quoted a passage from a Greek poet in the House of Commons, when in reality he only uttered a gabble resembling Greek. An honourable gentleman, who spoke after him, fully assented to the application of the passage to the case in question. How ineffably ridiculous must that man have appeared when Sheridan disclosed the trick! This is a dishonour to which every one is exposed, who in any way, however slight or negative, affects to appear knowing where he is ignorant.

The practice is also to be regarded as very injurious to conversation. Indeed, when one remembers how much of the time of most social assemblages is occupied in the vapourings of those who would fain be thought knowing, or in worrying down the assertions hazarded by ignorant effrontery, or in allowing those who know nothing on the point in question to speak of something else not called for, merely that they may seem to know something—and when he contrasts this uninstructive jabber with the comparatively well-authenticated statements to be found in books—he might almost be tempted to think that a page well read is worth a whole evening of ordinary conversation. Perhaps it would really be so, if there were not in conversation a gratification to a different part of the mental nature, the social feelings, and also an excitement which occasionally scintillates new and original ideas, and leads to profitable trains of thought and inquiry for the future.

Speaking vaguely in ignorance, and then defending what has been said, is another of the great banes of conversation in all except highly accomplished circles; and I have often wished for the presence of some one who, having committed a whole encyclopædia, almanac, and ready-reckoner, to his mind, would be able to correct all wide and false speaking, and thus check long endless discussions in the outset. I once witnessed the good effects of such a monitor, in the course of an excursion in an Irish steamer. Some young men were delivering their ideas about a variety of matters in the usual loose way, and one of them at length remarked of the pyramids, that they were so very high that he verily believed the Wicklow hills were a joke to them.

"I should think not," said a solemn, quiet-looking man. "The pyramids are known to be very much less than the Wicklow mountains."

"And did you ever see the pyramids, then?"

"No, sir."

"But *I* have; and, I can tell you, the Wicklow hills are nothing at all beside them."

"I am sorry, sir," resumed the solemn man, "that I cannot join you in that opinion. Although I have not seen the pyramids, I know their measure by the accounts of the best authors. The largest is now fixed at five hundred and forty-three feet high. But the Wicklow hills are generally from two to three thousand feet. Besides, pyramids are only the one-third of prisms of equal base and height, and the solidity is as one-third of the area of the base by the height; while the Wicklow hills, being of a swelling form, must, in proportion to height, give more solid contents."

Here was one assertion of loud ignorance completely put down. But another was not long wanting.

"What sad accounts these are for the ladies!" remarked one of the young men; "I mean the accounts which are published of the greater number of women than men in our principal cities, as ascertained by the late census."

"What can it be owing to?" inquired another.

"Why, I suppose it must be owing to a vast number of men being taken away as emigrants, soldiers, and sailors, and to so many of them getting killed in battle and otherwise."

"I should rather think there must be more women born than men."

"Oh, not at all; the numbers must be equal at first, you know."

"I know nothing of the kind. There cannot be so very many men carried away to the colonies and the army. It must be owing to the greater number of girls born. Why, nearly every family I know has more girls than boys."

"Well, for my part, I cannot see how the sexes should not be equal at first."

"But they cannot be equal, I tell you," &c.

Thus commenced a dispute which was kept up stoutly on both sides for a quarter of an hour, without one particle of real information on either; when at length one of the contending parties asked the solemn man if he did not think his view of the question right.

"No, I don't," said the solemn man; "neither of you is right. On the average of European countries, a hundred and six boys are born for every hundred girls. If, therefore, the two sexes had an equal chance of life, and remained in equal circumstances, there should be a preponderance of males to that extent. To account for the opposite being the case, we may chiefly look to the ascertained greater value of female than male life. A man at forty has the expectation of twenty-seven more years; but a woman of forty has the expectation of thirty-one years; and so on in proportion at other ages. The superiority of female to male life is, partly, no doubt, owing to the comparative exemption of women from the severer hardships of life, and from warfare; but it is probably owing in most part to the superior adaptation of their constitutions to the existing general circumstances of society, as the excess of male mortality is greatest in infancy, the deaths of boys in the first year in Europe being as about four to three of girls, while even in still births the females have about the same advantage, the proportions there being as ten to fourteen."

It was of course pedantic to have so much out-of-the-way knowledge at command; but its effect in the present case, in stopping short what would probably have been an incessant wrangle for the remainder of the voyage, made me truly thankful that the solemn man had chanced to be of our company. I am no advocate for all men being crammed with facts such as those which this individual could bring forth so readily; but it is surely no unreasonable demand that, when men are totally ignorant of any subject, they will refrain from disputing about it—that, in short, they should *know before they speak.*

There are some doubtful branches of knowledge, which furnish a rich field for those who delight to speak, oracularly or otherwise, without the previous trouble of acquainting themselves with the subject. Such are phrenology and animal magnetism, respecting which there has been gathered just a sufficiency of facts to afford a probability and to stimulate to

further investigation, but not enough to convince the majority of philosophical minds. When a branch of knowledge is in this state, the speakers in ignorance have no mercy upon it. Facts are nothing to them, for they know nothing about facts. They only know that they are safe from the correction of the majority of enlightened minds in giving such subjects their ridicule. Without the least regard to the specific merits of the two subjects named, I would venture to make the general remark, that some knowledge seems necessary to entitle any one to speak on any point that may come under discussion; and that, without this requisite, it cannot be expected that error, where there is error, will be successfully opposed. A disciple of Dr Gall has remarked, that often, in listening to the empty observations which ignorant men and ignorant women take leave to make on his science, he has been conscious of a more profound degree of the ridiculous than he could recollect ever experiencing on any other occasion in his life—so absurd did it appear, that one unacquainted with the simplest principles of physiology or any other established science, and who had never given one moment's study or one serious thought to the subject under discussion, should make such a gross exhibition of his self-esteem, not only unchecked by the audience, but with their concurrence. What the audience received as legitimate ridicule came before his mind as only a betrayal of ignorance on that and all associated questions, accompanied by a vainglory which the greatest wisdom could not have justified. This feeling in the mind of the phrenologist is natural, and, supposing him to be altogether mistaken with regard to his science, *his* ridicule has certainly a superiority over that of his opponent, in being founded on some knowledge. It is perhaps chiefly from this cause that none of those who adopt doubtful sciences are ever unconvinced. They ground so far upon what they believe to be ascertained truths in nature. Antagonists are contented to suppose, without putting themselves to the trouble of gathering opposite facts. A different effect is not to be expected till men shall generally acknowledge and act upon the maxim, to KNOW BEFORE THEY SPEAK.

NORTHERN COLLIERIES.

CONCLUDING ARTICLE.

HAVING glanced at the chief points regarding the Newcastle collieries, in their establishment, mode of working, and the calamities attending their operations, it now only remains to touch upon the physical and moral condition of the collier population. The number, then, of persons actually employed in and about the Newcastle pits exceeding 12,000, it is obvious that their physical and moral condition must be a matter of the greatest interest, particularly as that condition also influences to a great extent that of the females and children constituting the families of the pitmen.

To commence with the external appearance of a born and bred pitman, it may be noticed that his outward man distinguishes him from every other operative. His stature is diminutive; his figure disproportionate and misshapen; his legs being much bowed; his chest protruding (the *thoracic* region being unequally developed). His countenance is not less striking than his figure, his cheeks being generally hollow, his brow overhanging, his cheek bones high, his forehead low and retreating; nor is his appearance healthful. His habit is tincted with scrofula. I have seen agricultural labourers, blacksmiths, carpenters, and even those among the wan and distressed stocking-weavers of Nottinghamshire, to whom the term "jolly" might not be inaptly applied, but I never saw a "jolly-looking" pitman. As the germ of this physical degeneration may be formed in the youthful days of the pitman, it is desirable to look for its cause.

The position of the hewer at his work is one of great restraint; he lies, as it were, upon one leg, the other resting on the foot in a state of semi-flexion; his body is thrown forward, and in this position he strikes the seam with his "pick." There is an art in "cutting" coal; the occupation is therefore assumed at as early a period as the operative's strength and the superintendant's arrangements will permit, which generally happen to agree at about the age of 20. Although the chest and arms of the hewer are the best developed parts about him, and are very far from amiss, yet they cannot be compared with the corresponding parts of a Northumbrian agricultural labourer. As sources of health to the pitmen, may be noticed their daily habit of washing and scrubbing themselves above the waist and below the knees, except the back, which, with the rest, is regularly washed once a-week; and also their wearing flannel to absorb perspiration and retain heat, while not working, and to ward off the flame in case of "fire." The fine particles of coal-dust, so far as I have observed, seem little if at all injurious to pitmen, notwithstanding the fatal effects of breathing other kinds of dust; as, for instance, by our stone-masons, especially in Scotland, who "dress" in close places; or our Sheffield knife-grinders, and others. The vegetable origin of coal, and its consequent subjection to the laws of chemistry, seems to furnish a sufficient explanation of this. Pitmen are frequently known to keep their health wonderfully well while "working wet," although having to stand for hours in many inches or a few feet of water—a result that may perhaps be accounted for when we look to the temperature of the water in many cases, to its saline impregnations, to its faculty of absorbing any noxious gases, and of promoting ventilation; to the exercise taken at the time, and, if we except the time of detention at the bottom of the shaft before being pulled up to "bank," we may add, to the care with which the pitman washes, rubs, and changes himself on getting home.

The principal diseases of pitmen are what medical men term functional, and are chiefly, of course, referable to the nervous system. Of these may be particularly mentioned difficulty of breathing (dyspnœa) and indigestion (dyspepsia). The former affection is usually but temporary, and yields to the application of known remedies; and the same might be affirmed of the latter, did not the patient too frequently protract the attack by wilfully transgressing all dietetic rules. A deficiency of moral courage has been alleged as a characteristic of pitmen; but this certainly is not their failing in respect to the dangers of the mine. In the painful hostilities, however, caused by one or two unhappy "strikes," they have given evidence of this infirmity, and have rendered themselves ridiculous by their agressive weakness.

Many of the physical effects of pit work are of tardy growth and manifestation; hence they must be looked for and estimated in some of the old collieries, where the labour has been the uninterrupted occupation of generations. Conclusions deduced, for example, from the appearance of the work-people in the newer collieries of the south of Durham would be partially fallacious. In scrutinising the boys, the corporeal characteristics of the adults may be frequently noticed in incipient development in the adolescents, or hereditarily transmitted to the children. Small bulk of body, paleness and angularity of visage, and their general appearance, which is very far from robust, would lead to the conviction, that they are a somewhat deteriorated race. Some effects, however, of employment in coal-mines, which might have been assumed from *à priori* conclusions, are not found to be established by actual experience. Of this nature is the natural supposition, that the exclusion from sun-light during so large a portion of the day (and in the case of the boys in winter, it almost amounts to an exclusion from the entire daylight) would be actively injurious to the eyesight. But this is not found to be the case in the young; and in the old an occasional tendency to regard objects, especially books, with a peculiar oblique look, is all that I could discover. The most remarkable effect of the exclusion in the mines is the paleness of countenance so generally observable, and so strikingly contrasted with the ruddy visages of those employed at bank. To extreme changes of temperature, not to be braved with impunity by an occasional visitant to the pits (of which I became painfully aware), the miners appear to have become perfectly indurated. Over the slight tunic of flannel in which, together with drawers, they ordinarily labour (although a very near approach to nudity is observable in some deep and hot pits, as in Monkwearmouth; and in Shilbottle pit, which supplies the town of Alnwick with fuel, the men work completely naked), they add a jacket before emerging from the pit-mouth; and thus moderately enveloped, and commonly disdaining greatcoats or plaids in the severest weather, the inclemency of seasons appears to be, as far as they are concerned, completely innocuous. The temperature of the mines varies at different times and in different pits. The average heat in one of the Hetton pits at the bottom of the shaft is 66 degrees, and in the recesses of the workings 70 degrees; while at Monkwearmouth pit, the extreme case, the average heat is about 78 or 80 degrees.

Let us, however, follow the colliers home, and regard them when out of the pit. Upon the termination of their daily duty they return to their houses, which, from the early hour of commencing their mole-like labours, they may be seen doing at mid-day, or earlier, in companies of a very uninviting aspect. Trios or long strings of these black-looking individuals may be seen approaching from the site of the pit, many of them swinging their Davy-lamps about with their long and oddly-carried arms, and others handling the tin bottle which held their coffee. Upon their entrance into their little cottages, they proceed to strip and wash themselves, which, from the secluded character of the colliery villages, they see no harm in performing somewhat openly. The hour of dinner with the factory artisans thus becomes with the colliers the hour of washing; and the repeated ejections of soap-suds from each door testifies to the care with which ablution is accomplished. The meal to which the colliers now sit down is one of no despicable character. There is no deficiency of animal food and of little luxurious appurtenances; one of which used to be considered quite indispensable, namely, a rich kneaded cake, which, from the hissing noise it emits while baking on the "girdle," is termed, not inaptly, a *singing-hinnie*. After taking a very tolerable quantity of the good things set before them, the majority turn into bed, and one hears or sees little of them till the evening, when perhaps they may indulge in a walk, a whiff of tobacco, a scrape on the fiddle, or a puff at the flute, before finally retiring.
